In these examples, a FortiAuthenticator is used as the IdP, and MFA is applied to user authentication for remote users accessing the web, RDP, and SSH resources over the ZTNA application gateway. It is assumed that the FortiGate EMS fabric connector has already been successfully connected.

- [Configuring the FortiAuthenticator on page 1137](#)
- [Configuring the FortiGate SAML settings on page 1141](#)
- [Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy on page 1145](#)
- [Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections on page 1148](#)
- [Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy on page 1150](#)

DNS resolutions:

- webserver.ztnademo.com:9443 -> 10.0.3.10:9443
- fac.ztnademo.com -> 10.0.3.7

The FortiAuthenticator (FAC) integrates with Active Directory (AD) on the Windows Domain Controller, which is also acting as the EMS server. Users are synchronized from the AD to the FAC, and remote users are configured with token-based authentication. SAML authentication is configured on the FortiGate, pointing to the FAC as the SAML IdP. The

SAML server is applied to the ZTNA application gateway authentication scheme and rule, to provide the foundation for applying user authentication on individual ZTNA policies.

Configuring the FortiAuthenticator

First configure the FortiAuthenticator to synchronize users from AD using LDAP, apply MFA to individual remote users, and be the IdP.

To create a remote authentication server pointing to the Windows AD:

1. Go to *Authentication > Remote Auth. Servers > LDAP* and click *Create New*.
2. Configure the following:

Name	FortiAD
Primary server name / IP	10.88.0.1
Port	389 (or another port if using LDAPS)
Based distinguished name	DC=fortiad,DC=info
Bind type	Regular
Username	<user account used for LDAP bind>
Password	<password of user>
Server Type	Microsoft Active Directory
User object class	person (default)
Username attribute	sAMAccountName (default)
Group object class	group (default)
Obtain group membership from	User attribute
Group membership attribute	memberOf (default)
Secure connection	Enable if using LDAPS or STARTTLS

3. Click *OK*.
4. Edit the *FortiAD* entry.
5. At the bottom, click *Import users*.

Edit LDAP Server

Name:

Primary server name/IP: Port:

☐ Use secondary server

☐ Use Zero Trust tunnel [Please Select]

Base distinguished name:

Bind type: ☐ Simple ☒ Regular

Username: Password:

Server type: ☒ Microsoft Active Directory ☐ OpenLDAP/GSuite ☐ Novell eDirectory/Other

☐ Add supported domain names (used only if this is not a Windows Active Directory server)

Query Elements

User object class:

Username attribute:

Group object class:

Obtain group memberships from: ☒ User attribute ☐ Group attribute

Group membership attribute:

☐ Force use of administrator account for group membership lookups

Secure Connection

☐ Enable

Windows Active Directory Domain Authentication

☐ Enable

6. On the *Import Remote LDAP User* screen, configure the following settings:
 - a. For *Remote LDAP Server*, select *FortiAD*.
 - b. For *Action*, select *Import users*.
 - i. Click *Go*.
 - ii. Select the users to import.
 - iii. Click *OK*.

The screen displays the users that are imported.

<input type="checkbox"/>	Username	Remote LDAP Server	Admin	Status	Token	Token Requested
<input type="checkbox"/>	lhansen	FortiAD (10.88.0.1)	<input checked="" type="radio"/>	<input checked="" type="radio"/>		<input checked="" type="radio"/>

<input type="checkbox"/>	tsmith	FortiAD (10.88.0.1)	<input checked="" type="radio"/>	<input checked="" type="radio"/>	Email (tsmi...	<input checked="" type="radio"/>

3 / 30000 remote LDAP users

For more details, see [LDAP](#) in the [FortiAuthenticator Administration Guide](#).

To configure a remote LDAP user to use MFA:

1. Go to *Authentication > User Management > Remote Users*, and edit a user.
2. Enable *One-Time Password (OTP) authentication*.
 - a. Set *Deliver token codes from*.
 - b. Set *Deliver token by*.

For this example, select *FortiToken > Mobile*, select the Token from the drop-down list, and set the *Activation delivery method* to email.

3. In the *User Information* section, add the email address that will be used for the FortiToken activation.

Edit Remote LDAP User

Remote LDAP server: FortiAD (10.88.0.1)
 Username: tsmith
 Distinguished name: CN=Tom Smith,OU=Sales,DC=fortiad,DC=info

☐ Disabled
☒ One-Time Password (OTP) authentication

Deliver token codes from: FortiAuthenticator FortiToken Cloud
 Deliver token code by: FortiToken Email SMS Dual (Email & SMS) Test Token
 Hardware Mobile

Token: FTKMOB1875E1E09F
 Activation delivery method: Email SMS Scan QR code
 Temporary token

☐ FIDO authentication
☒ Allow RADIUS authentication
☐ Sync in HA Load Balancing mode

User Role
 Role: Administrator Sponsor **User**

User Information

Display name:
 First name: Tom Last name: Smith

 Department:
 Title:
 Birthdate:
 Language: Use default

4. Click **OK**.

An activation email is sent to the user that they can use to install the token to their FortiToken Mobile app. For more details, see [Remote users](#) in the [FortiAuthenticator Administration Guide](#).

To configure SAML IdP:

- Go to *Authentication > SAML IdP > General* and enable *Enable SAML Identity Provider portal*.
- The *Server address* is the device FQDN or IP address (configured in the System Information widget at *System > Dashboard > Status*). In this example, it is *fac.ztnademo.com*.
- Set *Username input format* to *username@realm*.
- Click *Add a realm* in the *Realms* table:
 - Set *Realm* to the just created LDAP realm (*FortiAD*).
 - Optionally, enable *Filter* and select the required users groups. In this example, *Sales* is configured.
- Set *Default IdP certificate* to the certificate that will be used in the HTTPS connection to the IdP portal.

Edit SAML Identity Provider Settings

☒ Enable SAML Identity Provider portal

Device FQDN: fac.ztnademo.com
 Server address: fac.ztnademo.com
 IdP-initiated login URL: https://fac.ztnademo.com/saml-idp/portal/

Username input format:
☒ username@realm
☐ realm/username
☐ realm/username

☒ Use default realm when user-provided realm is different from all configured realms

Realms:

Default	Realm	Allow Local Users To Override Remote Users	Groups	Delete
<input checked="" type="radio"/>	fortiad FortiAD (10.88.0.1)	<input type="checkbox"/>	<input checked="" type="checkbox"/> Filter: Sales <input type="checkbox"/> Filter local users:	

[Add a realm](#)

Login session timeout: 480 minutes (5-1440)
 Default IdP certificate: ZTNA_Server | CN=*.ztnademo.com
☐ Automatically switch IdP certificate before its expiry time
 Default signing algorithm: http://www.w3.org/2000/09/xmldsig#rsa-sha1
☐ Get nested groups for user
☐ IAM login

OK

6. Click **OK**.

7. Go to *Authentication > SAML IdP > Service Providers*, and click *Create New* to create a service provider (SP) for the FortiGate SP.
8. Configure the following, which must match what will be configured on the FortiGate:

SP name	saml-service-provider
IdP prefix	ztna
Server certificate	Use default setting in <i>SAML IdP > General</i> page.
SP entity ID	http://webserver.ztnademo.com:9443/remote/saml/metadata/
SP ACS (login) URL	https://webserver.ztnademo.com:9443/remote/saml/login
SP SLS (logout) URL	https://webserver.ztnademo.com:9443/remote/saml/logout
Participate in single logout	Enable

Where the *SP entity ID*, *SP ACS (login) URL*, and *SP SLS (logout) URL* break down as follows:

- *webserver.ztnademo.com* - The FQDN that resolves to the FortiGate SP.
- *9443* - The port that is used to map to the FortiGate's SAML SP service.
- */remote/saml/* - The custom, user defined fields.
- */metadata*, */login*, and */logout* - The standard convention used to identify the SP entity, log in portal, and log out portal.

9. Click *OK*.
10. Edit the just created SP object and, under *Assertion Attribute*, click *Add Assertion Attribute*.
11. Set *SAML attribute* to the username and set *User attribute* to *Username*, then click *OK*.
12. Click *OK*.

For more details, see [Configuring SAML settings in the SAML Interoperability Guide](#).

Configuring the FortiGate SAML settings

On the FortiGate, a SAML user is used to define the SAML SP and IdP settings. This user is then applied to the ZTNA proxy using an authentication scheme, rule, and settings. A ZTNA server is then created to allow access to the SAML SP server so that end users can reach the FortiGate SP's captive portal. The SAML user must then be added to a ZTNA policy to trigger authentication when accessing the ZTNA application gateway.

To create a new SAML user/server from the GUI:

1. On the FortiGate, go to *User & Authentication > Single Sign-On*.
2. Click *Create New*.
3. Set *Name* to *ZTNA-FAC-SAML*.
4. Set *Address* to *webserver.ztnademo.com:9443*.

The *Entity ID*, *Assertion consumer service URL* and *Single logout service URL* will be updated. These should be the same URLs you inputted into FAC.

5. Enable *Certificate*, then select the certificate used for the client.

In this example, the *ztna-wildcard* certificate is a local certificate that is used to sign SAML messages that are exchanged between the client and the FortiGate SP.

6. Click *Next*.
7. Use the settings from the Identity Provider to fill the custom *Identity Provider Details*. In this example, we select *Fortinet Product*, and fill in the fields as follows:

Address	fac.ztnademo.com
Prefix	ztna
IdP certificate	REMOTE_Cert_1

- Where the `REMOTE_Cert_1` certificate is a remote certificate that is used to identify the IdP; in this example, `fac.ztnademo.com`.

8. Set *Attribute used to identify users* to *username*. Attributes to identify users and groups are case sensitive.

New Single Sign-On

1 Input Service Provider Details 2 Input Identity Provider Details

Identity Provider Details

Log into your Identity Provider platform to find the following information.

Type: **Fortinet Product** Custom

Address: fac.ztnademo.com

Prefix: ztna

Certificate: REMOTE_Cert_1

Additional SAML Attributes

The FortiGate will look for these attributes to verify authentication attempts. Configure your Identity Provider to include them in the SAML Attribute Statement.

Attribute used to identify users: username

Attribute used to identify groups:

Back Submit Cancel

9. Click **Submit** to save the settings.

To create a new SAML user/server from the CLI:

```
config user saml
  edit "ZTNA-FAC-SAML"
    set cert "ztna-wildcard"
    set entity-id "http://webserver.ztnademo.com:9443/remote/saml/metadata/"
    set single-sign-on-url "https://webserver.ztnademo.com:9443/remote/saml/login"
    set single-logout-url "https://webserver.ztnademo.com:9443/remote/saml/logout"
    set idp-entity-id "http://fac.ztnademo.com/saml-idp/ztna/metadata/"
    set idp-single-sign-on-url "https://fac.ztnademo.com/saml-idp/ztna/login/"
    set idp-single-logout-url "https://fac.ztnademo.com/saml-idp/ztna/logout/"
    set idp-cert "REMOTE_Cert_1"
    set user-name "username"
    set digest-method sha1
  next
end
```

To create a user group for the SAML user object:

1. Under *User & Authentication > User Groups*, click *Create New*.
2. Set *Name* to *ztna-saml-users*.
3. Under *Remote Groups*, click *Add*.
4. For *Remote Server*, select *ZTNA-FAC-SAML*.
5. Click *OK*.
6. Click *OK* again to save.

To apply the SAML server to proxy authentication from the GUI:

1. Go to *Policy & Objects > Authentication Rules*.
2. Click *Create New > Authentication Scheme*.
3. Set the name to *ZTNA-SAML-scheme*.

4. Set *Method* to *SAML*.
5. Set *SAML SSO server* to *ZTNA-FAC-SAML*.
6. Click *OK*.
7. Go to *Policy & Objects > Authentication Rules*.
8. Click *Create New > Authentication Rule*.
9. Set the *Name* to *ZTNA-SAML-rule*.
10. Set *Source Address* to *all*.
11. Set *Incoming interface* to *port3*.
12. Set *Protocol* to *HTTP*.
13. Enable *Authentication Scheme* and select *ZTNA-SAML-scheme*.
14. Set *IP-based Authentication* to *Disable*.
15. Click *OK*.

To apply the SAML server to proxy authentication from the CLI:

```
config authentication scheme
    edit "ZTNA-SAML-scheme"
        set method saml
        set saml-server "ZTNA-FAC-SAML"
    next
end
config authentication rule
    edit "ZTNA-SAML-rule"
        set srcintf "port3"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "ZTNA-SAML-scheme"
        set web-auth-cookie enable
    next
end
```

Assign an active authentication scheme and captive portal to serve the log in page for the SAML requests.

To configure the active authentication scheme and captive portal from the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Enable *Authentication scheme*.
3. Select *ZTNA-SAML-scheme*.
4. Set *Captive portal type* to *FQDN*.
5. Enable *Captive Portal*.
6. Select the firewall address *webserver.ztnademo.com*. If this has not be created, create this firewall address.
7. Click *Apply* to save.

To configure the active authentication scheme and captive portal from the CLI:

```
config firewall address
    edit "webserver.ztnademo.com"
        set type fqdn
        set fqdn "webserver.ztnademo.com"
    next
```

```

end
config authentication setting
    set active-auth-scheme "ZTNA-SAML-scheme"
    set captive-portal "webserver.ztnademo.com"
end

```

To configure a ZTNA application gateway to allow SAML authentication requests to the SP:

1. Configure the ZTNA server:
 - a. Go to *Policy & Objects > ZTNA*, select the *ZTNA Servers* tab, and click *Create New*.
 - b. Configure the following:

Name	ZTNA-access
External interface	Any
External IP	10.0.3.10
External port	9443
SAML	Enabled
SAML SSO Server	ZTNA-FAC-SAML
Default certificate	ztna-wildcard

- c. Click *OK*.
2. Define the full ZTNA policy to allow access to the ZTNA server:
 - a. Go to *Policy & Objects > Proxy policy* and click *Create New*.
 - b. Configure the following:

Name	ZTNA-Rule
Type	ZTNA
Incoming Interface	port3
Source (Address)	all
Source (User)	ztna-saml-users
Destination	all
ZTNA Server	ZTNA-access
Action	Accept
Log Allowed Traffic	All Sessions

- c. Click *OK*.

To configure a VIP and a firewall policy to forward IdP authentication traffic to the FortiAuthenticator:

Remote clients connect to the FortiAuthenticator IdP behind the FortiGate using a VIP. In this example, users connect to the FQDN fac.ztnademo.com that resolves to the VIP's external IP address.

1. Configure the VIP to forward traffic to the FortiAuthenticator:
 - a. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
 - b. Configure the following:

Name	FAC-VIP
Interface	Any
External IP address	10.0.3.7
Map to > IPv4 address/range	10.88.0.7
Port Forwarding	Enabled
Protocol	TCP
External service port	443
Map to IPv4 port	443

- c. Click OK.
2. Configure a firewall policy to allow VIP:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Configure the following:

Name	WAN_to_FAC
Type	Standard
Incoming Interface	port3
Outgoing Interface	port2
Source	All
ZTNA Server	FAC-VIP
Schedule	Always
Service	HTTP. HTTPS
Action	Accept
NAT	disabled

- c. Click OK.

Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy

In this HTTPS access proxy example, two real servers are implemented with round robin load balancing performed between them. The HTTPS access proxy is configured on the same ZTNA server as was configured in the authentication step. The same ZTNA rule and firewall policy also apply.

To configure the ZTNA server for HTTPS access proxy with load balancing:

1. Go to *Policy & Objects > ZTNA* and select the *ZTNA Servers* tab.
2. Edit the ZTNA-access server.
3. In the *Service/server mapping* table, click *Create New*:
 - a. Set *Service* to *HTTPS*.
 - b. Set *Virtual Host* to *Any Host*.
 - c. In the *Servers* table click *Create New*:
 - i. Set *IP* to *10.88.0.3*.
 - ii. Set *Port* to *9443*.
 - iii. Set *Status* to *Active*.
 - iv. Click *OK*.
 - d. Create a second server with *IP 10.88.0.4*.
 - e. Click *OK*.
4. Enable *Load balancing*, and select the *Round Robin* algorithm.
5. Click *OK*.
6. Click *OK* again to finish.

Testing and verification:

From the remote endpoint, user Tom Smith attempts to connect to the web server over ZTNA:

1. On the remote Windows computer, open FortiClient and register to the EMS server.

It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

2. Open a browser and attempt to connect to the web server at <https://webserver.ztnademo.com:9443>.
3. Device authentication prompts the user for their device certificate. Select the certificate issued by EMS and click *OK*.
4. FortiGate receives the SAML request and redirects the user to the IdP login screen. Enter the username and password for Tom Smith and click *Login*.
5. A second prompt opens asking for the *Token Code*. Enter the code then click *Verify*.

Not **tsmith**? [Sign in as a different user](#)

6. The FortiAuthenticator IdP verifies the login, then sends the SAML assertion back to the user.
7. The browser redirects the assertion to the FortiGate SP, which decides if the user is allowed access.
8. On a successful login, FortiGate redirects the user to the web page that they are trying to access.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field subtype srcip
# execute log display
...
2: date=2023-05-09 time=00:47:56 eventtime=1683618475812847145 tz="-0700" logid="0005000024"

```

Log number ten shows that authentication first passes through the WAN_to_FAC policy. Log numbers two and eight show the traffic allowed through the ZTNA proxy-policy over two successive sessions. Note that they have different destination IP addresses (dstip), indicating that ZTNA was performing server load balancing.

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list

ID: 8, VDOM: root, IPv4: 10.0.3.2
  user name      : tsmith
  worker         : 1
  duration       : 332
  auth_type      : Session
  auth_method    : SAML
  pol_id         : 1
  g_id           : 4
  user_based     : 0
  expire         : 390
  LAN:
    bytes_in=29519 bytes_out=629987
```

WAN:

bytes_in=958636 bytes_out=19201

Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections

In this TCP forwarding access proxy example, RDP connections are allowed to be forwarded to the Windows/EMS server. Traffic to TCP/3389 is allowed through the ZTNA proxy.

To configure the ZTNA server for TCP forwarding on TCP/3389:

1. Create a firewall address for the Windows/EMS server:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following:

Name	winserver
Type	Subnet
IP/Netmask	10.88.0.1/32
Interface	any

- c. Click *OK*.
2. Go to *Policy & Objects > ZTNA* and select the *ZTNA Servers* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, click *Create New*:
 - a. Set *Service* to *TCP Forwarding*.
 - b. In the *Servers* table click *Create New*:
 - i. Set *Address* to *winserver*.
 - ii. Set *Ports* to *3389*.
 - iii. Click *OK*.
 - c. Click *OK*.
5. Click *OK*.

Testing and verification:

On the remote endpoint, manually configure a ZTNA destination to forward RDP traffic to the ZTNA application gateway. The rules can also be pushed from the EMS server; for details see [Provisioning ZTNA TCP forwarding rules via EMS](#).

Configure the ZTNA Destination:

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Destination* tab, click *Add Destination* to add a TCP forwarding rule.

4. Configure the following:

Rule Name	RDP-server
Destination Host	10.88.0.1:3389
Proxy Gateway	10.0.3.10:9443
Mode	Transparent
Encryption	Disabled <i>Encryption</i> can be enabled or disabled. When it is disabled, the client to access proxy connection is not encrypted in HTTPS. Because RDP is encrypted by default, disabling <i>Encryption</i> does not reduce security.

5. Click *Create*.

Connect over RDP:

1. On the remote PC, open a new RDP connection.
2. Enter the IP address 10.88.0.1. By default, RDP session use port 3389.
When the connection to the ZTNA application gateway is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.
A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the RDP session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display
...
8: date=2023-05-09 time=01:14:34 eventtime=1683620074907124357 tz="-0700" logid="0005000024"

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list
```

```
ID: 9, VDOM: root, IPv4: 10.0.3.2
  user name   : tsmith
  worker      : 1
  duration    : 164
  auth_type   : Session
  auth_method : SAML
  pol_id      : 1
  g_id        : 4
  user_based  : 0
  expire      : no
LAN:
  bytes_in=80950 bytes_out=233010
WAN:
  bytes_in=219973 bytes_out=58315
```

Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy

In this SSH access proxy example, SSH connections can be forwarded to the FortiAnalyzer (10.88.0.2).

To configure the ZTNA server for SSH access proxy:

1. Create a firewall address for the web server:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following:

Name	FAZ
Type	Subnet
IP/Netmask	10.88.0.2/32
Interface	any

- c. Click *OK*.
2. Go to *Policy & Objects > ZTNA* and select the *ZTNA Servers* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, edit the *TCP Forwarding* entry:
 - a. In the *Servers* table click *Create New*:
 - i. Set *Address* to *FAZ*.
 - ii. Set *Ports* to *22*.
 - iii. Optionally, enable *Additional SSH Options* to configure other SSH options as needed.
 - iv. Click *OK*.
 - b. Click *OK*.
5. Click *OK*.

Testing and verification:

On the remote endpoint, manually configure ZTNA destination to forward SSH traffic to the ZTNA access proxy. The destination can also be pushed from the EMS server; for details see [Provisioning ZTNA TCP forwarding rules via EMS](#).

Configure the ZTNA Destination:

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Destination* tab, click *Add Destination* to add a TCP forwarding rule.
4. Configure the following:

Rule Name	SSH-FAZ
Destination Host	10.88.0.2:22
Proxy Gateway	10.0.3.10:9443
Mode	Transparent
Encryption	Disabled

5. Click *Create*.

Connect over SSH:

1. On the remote PC, open a new SSH connection.
2. Enter the host admin@10.88.0.2 on port 22.
When the connection to the ZTNA application is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.
A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the SSH session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display
...
5: date=2023-05-09 time=10:06:04 eventtime=1683651963820802005 tz="-0700" logid="0005000024"

auth_method : SAML
pol_id      : 1
g_id        : 4
user_based  : 0
expire      : no
```

```
LAN:
```

```
bytes_in=23261 bytes_out=14024
```

```
WAN:
```

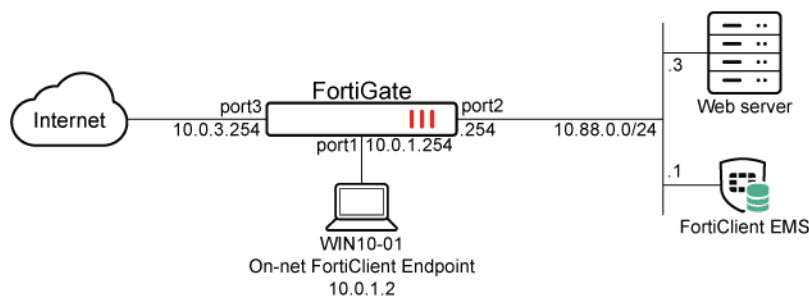

```
bytes_in=3242 bytes_out=2541
```

ZTNA IP MAC based access control example

In this example, firewall policies are configured that use ZTNA tags to control access between on-net devices and an internal web server. This mode does not require the use of the access proxy, and only uses ZTNA tags for access control. Traffic is passed when the FortiClient endpoint meets two conditions.

1. It is tagged with the *Domain-Users* ZTNA tag, identifying the device as logged on to the Domain.
2. It has the *High* importance classification tag indicating the device is High importance and low risk.

Traffic is denied when the FortiClient endpoint is tagged with *Malicious-File-Detected*.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

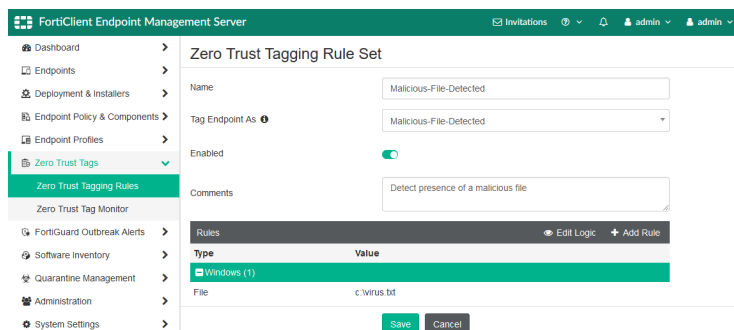

To configure ZTNA in the GUI, go to *System > Feature Visibility* and enable *Zero Trust Network Access*.

To configure Zero Trust tagging rules on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags > Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.
5. Click *Add Rule* then configure the rule:

- a. For OS, select *Windows*.
- b. From the *Rule Type* dropdown list, select *File* and click the + button.
- c. Enter a file name, such as *C:\virus.txt*.
- d. Click **Save**.

6. Click **Save**.
7. Click **Add** again to add another rule.
8. In the *Name* field, enter *Domain-Users*.
9. In the *Tag Endpoint As* dropdown list, enter *Domain-Users* and press **Enter**.
10. Click **Add Rule**, then configure the rule:
 - a. For OS, select *Windows*.
 - b. From the *Rule Type* dropdown list, select *User in AD Group*.
 - c. For *AD Group*, select the *Domain-Users* AD group.
 - d. Click **Save**.

To configure a classification tag on the FortiClient EMS:

1. Go to *Endpoint > All Endpoints*.
2. Select the WIN10-01 computer that will be granted access. This computer should be already registered to FortiClient EMS.
3. In the *Summary* tab, under *Classification Tags*, click **Add** and then set to High Importance.

4. Go to *Administration > Fabric Devices*.
5. Select the connecting FortiGate, then click **Edit**.
6. Under *Tag Types Being Shared*, add *Classification Tags*.
7. Click **Save**.

To configure a firewall policy with IP/MAC based access control to deny traffic in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* to *block-internal-malicious-access*.
3. Set *Type* to *Standard*.
4. Set *Incoming Interface* to *port1*.
5. Set *Outgoing Interface* to *port2*.
6. Set *Source* to *all*.
7. Set *IP/MAC Based Access Control* to the *Malicious-File-Detected* tag.
8. Set *Destination* to the address of the Web server. If no address is created, create a new address object for 10.88.0.3/32.
9. Set *Service* to *ALL*.
10. Set *Action* to *DENY*.
11. Enable *Log Violation Traffic*.
12. Configuring the remaining settings as needed.
13. Click *OK*.

To configure a firewall policy with IP/MAC based access control to allow access in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* to *allow-internal-access*.
3. Set *Type* to *Standard*.
4. Set *Incoming Interface* to *port1*.
5. Set *Outgoing Interface* to *port2*.
6. Set *Source* to *all*.
7. Set *IP/MAC Based Access Control* to the *Domain-Users ZTNA IP* tag.
8. Set *Logical And With Secondary Tags* to *Specify*. This option allows for a second group of tags to be used with a logical And operator.
9. Set *Secondary Tags* as the *High Class IP* tag.
10. Set *Destination* to the address of the Web server.
11. Set *Service* to *ALL*.
12. Set *Action* to *ACCEPT*.
13. Enable *Log Allowed Traffic* and set it to *All Sessions*.
14. Configuring the remaining settings as needed.
15. Click *OK*.

To configure firewall policies with IP/MAC based access control to block and allow access in the CLI:

```
config firewall policy
  edit 10
    set name "block-internal-malicious-access"
    set srcintf "port1"
    set dstintf "port2"
    set ztna-status enable
    set srcaddr "all"
    set dstaddr "Webserver"
    set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
```

```
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
edit 12
    set name "allow-internal-access"
    set srcintf "port1"
    set dstintf "port2"
    set action accept
    set ztna-status enable
    set srcaddr "all"
    set dstaddr "Webserver"
    set ztna-ems-tag "EMS1_ZTNA_Domain-Users"
    set ztna-ems-tag-secondary "EMS1_CLASS_High"
    set schedule "always"
    set service "ALL"
    set logtraffic all
next
end
```

When multiple tags are selected with `set ztna-ems-tag <tags>`, matching occurs using a logical OR operator. Therefore any single tag that match will return true.

The `set ztna-tags-match-logic {and | or}` option cannot be used to change the logical operator. This option is applied by wad to tags selected for ZTNA proxy-policy.

The `set ztna-ems-tag-secondary <tags>` option by default allows a second group of tags to be specified. This group and the primary group are joined by the logical and operator.

Testing the access to the web server from the on-net client endpoint

Access allowed:

1. On the WIN10-01 PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server.
4. The FortiGate matches your security posture by verifying your ZTNA tags and matching the corresponding `allow-`

`internal-access` firewall policy, and you are allowed access to the web server.

Access denied:

1. On the WIN10-01 PC, trigger the Zero Trust Tagging Rule by creating the file in `C:\virus.txt`.
2. Open a browser and enter the address of the server.
3. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *block-internal-malicious-access* firewall policy.
4. You are denied access to the web server.

ZTNA IPv6 examples

IPv6 can be configured in ZTNA in several scenarios:

- IPv6 Client — IPv6 Access Proxy — IPv6 Server
- IPv6 Client — IPv6 Access Proxy — IPv4 Server
- IPv4 Client — IPv4 Access Proxy — IPv6 Server

These examples show the basic configuration for each scenario. It is assumed that the EMS fabric connector is already successfully connected.

Example 1: IPv6 Client — IPv6 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```

config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end

```

2. Configure a virtual host:

```

config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "qa6.test.com"
    next
end

```

The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv6 address to the realserver:

```

config firewall access-proxy6
    edit "zs6"
        set vip "zv6"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv6"
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end

```

```

        end
    next
end

```

4. Apply the IPv6 access proxy to a proxy policy:

```

config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy6 "zs6"
        set srcintf "port2"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end

```

5. Apply the IPv6 VIP to a firewall policy:

```

config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zv6"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end

```

To test the configuration:

1. On an IPv6 client, ensure that the address qa6.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to <https://qa6.test.com:6443>.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```

3: date=2021-06-25 time=13:38:18 eventtime=1624653498459580215 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"
srcip=2000:10:1:100::214 srcport=55957 srcintf="port2" srcintfrole="undefined"
dstcountry="Reserved" srccountry="Reserved" dstip=2000:172:16:200::209 dstport=443
dstintf="root" dstintfrole="undefined" sessionid=92406 service="HTTPS" proto=6
action="accept" policyid=1 policytype="proxy-policy" poluid="7afdac8c-d5db-51eb-dfc6-
67bb86e4bdcf" policyname="ztna_rule" duration=5 wanin=2031 rcvdbyte=2031 wanout=1332
lanin=1247 sentbyte=1247 lanout=950 appcat="unscanned" utmaction="allow" countweb=1
utmref=65445-0

```

Example 2: IPv6 Client — IPv6 Access Proxy — IPv4 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
  edit "zv6"
    set type access-proxy
    set extip 2000:172:18:62::66
    set server-type https
    set extport 6443
    set ssl-certificate "cert"
  next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
  edit "vhost_ipv6"
    set ssl-certificate "cert"
    set host "qa6.test.com"
  next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv4 address to the realserver:

```
config firewall access-proxy6
  edit "zs6"
    set vip "zv6"
    config api-gateway6
      edit 1
        set virtual-host "vhost_ipv6"
        config realservers
          edit 1
            set ip 172.16.200.209
          next
        end
      next
    end
  next
end
```

4. Apply the IPv6 access proxy to a proxy policy:

```
config firewall proxy-policy
  edit 1
    set name "ztna_rule"
    set proxy access-proxy
    set access-proxy6 "zs6"
    set srcintf "port2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
```

```

        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end

```

5. Apply the IPv6 VIP to a firewall policy:

```

config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zv6"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end

```

To test the configuration:

1. On an IPv6 client, ensure that the address qa6.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to <https://qa6.test.com:6443>.
3. After device certificate verification, the browser will open up the webpage on the IPv4 real server.
4. In the Forward Traffic Log, the following log is available:

```

2: date=2021-06-25 time=13:46:54 eventtime=1624654014129553521 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"
srcip=2000:10:1:100::214 srcport=60530 srcintf="port2" srcintfrole="undefined"
dstcountry="Reserved" srccountry="Reserved" dstip=172.16.200.209 dstport=443
dstintf="root" dstintfrole="undefined" sessionid=219 service="HTTPS" proto=6
action="accept" policyid=1 policytype="proxy-policy" poluid="7afdac8c-d5db-51eb-dfc6-
67bb86e4bdcf" policyname="ztna_rule" duration=5 wanin=2028 rcvdbyte=2028 wanout=1321
lanin=1236 sentbyte=1236 lanout=947 appcat="unscanned" utmaction="allow" countweb=1
utmref=65443-14

```

Example 3: IPv4 Client — IPv4 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv4 access proxy VIP:

```

config firewall vip
    edit "zv4"
        set type access-proxy
        set extip 172.18.62.66
        set extintf "any"
    next
end

```

```
        set server-type https
        set extport 4443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv4"
        set ssl-certificate "cert"
        set host "qa.test.com"
    next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv4 access proxy and IPv6 api-gateway, apply the VIP and virtual host to it, and assign an IPv6 address to the realserver:

```
config firewall access-proxy
    edit "zs4"
        set vip "zv4"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv4"
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end
next
end
```

4. Apply the IPv4 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy "zs4"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv4 VIP to a firewall policy:

```

config firewall policy
  edit 4
    set name "ZTNA"
    set srcintf "port2"
    set dstintf "any"
    set action accept
    set srcaddr "all"
    set dstaddr "zv4"
    set schedule "always"
    set service "ALL"
    set inspection-mode proxy
    set logtraffic all
    set nat enable
  next
end

```

To test the configuration:

1. On an IPv4 client, ensure that the address qa6.test.com resolves to the IPv4 VIP address of 172.18.62.66.
2. In a browser, connect to <https://qa6.test.com:6443>.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

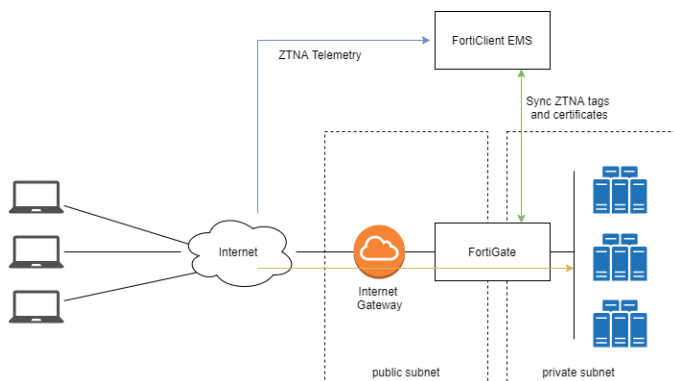

```

1: date=2021-06-25 time=13:52:30 eventtime=1624654350689576485 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"
srcip=10.1.100.206 srcport=53492 srcintf="port2" srcintfrole="undefined"
dstcountry="Reserved" srccountry="Reserved" dstip=2000:172:16:200::209 dstport=443
dstintf="root" dstintfrole="undefined" sessionid=726 service="HTTPS" proto=6
action="accept" policyid=1 policytype="proxy-policy" poluuid="7afdac8c-d5db-51eb-dfc6-
67bb86e4bdcf" policyname="ztna_rule" duration=0 wanin=1901 rcvdbyte=1901 wanout=736
lanin=569 sentbyte=569 lanout=3040 appcat="unscanned" utmaction="allow" countweb=1
utmref=65443-28

```

ZTNA Zero Trust application gateway example

The Zero Trust application gateway (ZTAG) for SaaS applications delivers Zero Trust Network Access (ZTNA) to companies that deploy SaaS applications and services in the cloud. A Zero Trust application gateway is deployed in the cloud, protecting resources on the private subnets by enforcing security and access control.

A Zero Trust application gateway can be deployed directly on AWS, Azure, and VMware. The deployment template can configure the necessary ZTNA settings to get the ZTNA configurations started.

For more information, see the [Zero Trust Application Gateway Admin Guide](#).

ZTNA troubleshooting and debugging commands

The following debug commands can be used to troubleshoot ZTNA issues:

Command	Description
# diagnose endpoint fctems test-connectivity <EMS>	Verify FortiGate to FortiClient EMS connectivity.
# execute fctems verify <EMS>	Verify the FortiClient EMS's certificate.
# diagnose test application fcnacd 2	Dump the EMS connectivity information.
# diagnose debug app fcnacd -1 # diagnose debug enable	Run real-time FortiClient NAC daemon debugs.
# diagnose endpoint record list <ip>	Show the endpoint record list. Optionally, filter by the endpoint IP address.
# diagnose endpoint lls-comm send ztna find-uid <uid> <EMS_serial_number> <EMS_tenant_id>	Query endpoints by client UID, EMS serial number, and EMS tenant ID.
# diagnose endpoint lls-comm send ztna find-ip-vdom <ip> <vdom>	Query endpoints by the client IP-VDOM pair.
# diagnose wad dev query-by uid <uid> <EMS_serial_number> <EMS_tenant_id>	Query from WAD diagnose command by UID, EMS serial number, and EMS tenant ID.
# diagnose wad dev query-by ipv4 <ip>	Query from WAD diagnose command by IP address.
# diagnose firewall dynamic list	List EMS ZTNA tags and all dynamic IP and MAC addresses.
# diagnose test application fcnacd 7 # diagnose test application fcnacd 8	Check the FortiClient NAC daemon ZTNA and route cache.
# diagnose wad worker policy list	Display statistics associated with access proxy rules.
# diagnose wad debug enable category all # diagnose wad debug enable level verbose # diagnose debug enable	Run real-time WAD debugs.
# diagnose debug reset	Reset debugs when completed

The WAD daemon handles proxy related processing. The FortiClient NAC daemon (fcnacd) handles FortiGate to EMS connectivity.

Troubleshooting usage and output

1. Verify the FortiGate to EMS connectivity and EMS certificate:

```
# diagnose endpoint fctems test-connectivity WIN10-EMS
Connection test was successful:

# execute fctems verify WIN10-EMS
Server certificate already verified.

# diagnose test application fcnacd 2
EMS context status:
FortiClient EMS number 1:
    name: WIN10-EMS confirmed: yes
    fetched-serial-number: FCTEMS0000109188
Websocket status: connected
```

2. If fcnacd does not report the proper status, run real-time fcnacd debugs:

```
# diagnose debug app fcnacd -1
# diagnose debug enable
```

3. Verify the following information about an endpoint:

- Network information
- Registration information
- Client certificate information
- Device information
- Vulnerability status
- Relative position with the FortiGate

```
# diagnose endpoint record list 10.6.30.214
Record #1:
    IP Address = 10.6.30.214
    MAC Address = 00:0c:29:ba:1e:61
    MAC list = 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b;
    VDOM = root (0)
    EMS serial number: FCTEMS8821001322
    EMS tenant id: 00000000000000000000000000000000
    Client cert SN: 17FF6595600A1AF53B87627AB4EBEDD032593E64
    Quarantined: no
    Online status: online
    Registration status: registered
    On-net status: on-net
    Gateway Interface: port2
    FortiClient version: 7.0.0
    AVDB version: 84.778
    FortiClient app signature version: 18.43
    FortiClient vulnerability scan engine version: 2.30
    FortiClient UID: 5FCFA3ECDE4D478C911D9232EC9299FD
    Host Name: ADPC
    ...
    Number of Routes: (1)
        Gateway Route #0:
            - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no
            - Interface:port2, VFID:0, SN: FG5H1E5819902474
online records: 1; offline records: 0; quarantined records: 0
```

4. Query the endpoint information, include ZTNA tags, by UID or IP address:

```
# diagnose endpoint lls-comm send ztna find-uid 5FCFA3ECDE4D478C911D9232EC9299FD
FCTEMS8821001322 0000000000000000000000000000000000000000
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
EMS Fabric ID: FCTEMS8821001322:0000000000000000000000000000000000000000
    status code:ok
    Domain: qa.wangd.com
    User: user1
    Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
    EMS SN: FCTEMS8821001322
    Routes(1):
    - route[0]: IP=10.1.100.214, VDom=root
    Tags(3):
    - tag[0]: name=ZT_OS_WIN
    - tag[1]: name=all_registered_clients
    - tag[2]: name=Medium

# diagnose endpoint lls-comm send ztna find-ip-vdom 10.1.100.214 root
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
    status code:ok
    Domain: qa.wangd.com
    User: user1
    Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
    EMS SN: FCTEMS8821001322
    Routes(1):
    - route[0]: IP=10.1.100.214, VDom=root
    Tags(3):
    - tag[0]: name=ZT_OS_WIN
    - tag[1]: name=all_registered_clients
    - tag[2]: name=Medium
```

5. Query endpoint information from WAD by UID or IP address:

```
# diagnose wad dev query-by uid 5FCFA3ECDE4D478C911D9232EC9299FD FCTEMS8821001322
0000000000000000000000000000000000000000
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS8821001322_all_registered_clients
Attr of type=4, length=39, value(ascii)=FCTEMS8821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS8821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS8821001322_Medium
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64

# diagnose wad dev query-by ipv4 10.1.100.214
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS8821001322_all_registered_clients
Attr of type=4, length=39, value(ascii)=FCTEMS8821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS8821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS8821001322_Medium
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64
```

6. List all the dynamic ZTNA IP and MAC addresses learned from EMS:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000109188_all_registered_clients: ID(51)
    ADDR(172.17.194.209)
    ADDR(192.168.40.8)
...
FCTEMS0000109188_Low: ID(78)
    ADDR(172.17.194.209)
    ADDR(192.168.40.8)
...
FCTEMS0000109188_Malicious-File-Detected: ID(190)
    ADDR(172.17.194.209)
    ADDR(192.168.40.8)
...
```

7. Check the FortiClient NAC daemon ZTNA and route cache:

```
# diagnose test application fcnacd 7
ZTNA Cache:
-uid 5FCFA3ECDE4D478C911D9232EC9299FD: { "tags": [ "ZT_OS_WIN", "all_registered_
clients", "Medium" ], "domain": "qa.wangd.com", "user_name": "user1", "client_cert_sn":
"17FF6595600A1AF53B87627AB4EBEDD032593E64", "owner": "FOSQA@qa.wangd.com", "gateway_
route_list": [ { "gateway_info": { "fgt_sn": "FG5H1E5819902474", "interface": "port2",
"vdom": "root" }, "route_info": [ { "ip": "10.1.100.214", "mac": "00-0c-29-ba-1e-6b",
"route_type": "direct" } ] } ], "ems_sn": "FCTEMS8821001322" }

# diagnose test application fcnacd 8
IP-VfID Cache:
IP: 10.1.100.206, vfid: 0, uid: 3DED29B54386416E9888F2DCBD2B9D21
IP: 10.1.100.214, vfid: 0, uid: 5FCFA3ECDE4D478C911D9232EC9299FD
```

8. Troubleshoot WAD with real-time debugs to understand how the proxy handled a client request:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable

[0x7fbd7a46bb60] Received request from client: 10.10.10.20:56312
GET / HTTP/1.1 Host: 192.168.2.86:8443 Connection: keep-alive Cache-Control: max-age=0

Always reset the debugs after using them:

```
# diagnose debug reset
```

ZTNA troubleshooting scenarios

This topic describes how to troubleshoot common FortiClient endpoint IP/MAC access control issues for the following topologies:

- [ZTNA access control on page 1171](#)
- [IP/MAC based access control on page 1172](#)

ZTNA access control

In this topology, FortiClient endpoints use an SSL encrypted connection to the FortiGate access proxy to access protected resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and ZTNA tags to control FortiClient endpoint access to resources.

This section describes how to handle the following errors:

- [Invalid ZTNA certificate on page 1171](#)
- [ZTNA policy mismatch on page 1172](#)

Invalid ZTNA certificate

When FortiClient attempts to access a server protected by ZTNA, an *Invalid ZTNA certificate* error is shown. This error often appears when the serial number for the ZTNA certificate differs between the endpoint and the FortiGate.

1. Check the serial number for the ZTNA certificate on the endpoint and the FortiGate:
 - a. On the endpoint, check the serial number for the certificate.
 - b. On the FortiGate, check the serial number for the client certificate by running the following command:

```
# diagnose endpoint record list
```
2. If the serial number for the ZTNA certificate differs between the endpoint and the FortiGate, and the serial number on the FortiGate is comprised of zeros, check the following:
 - a. For FortiClient, make sure that the endpoint is running FortiClient 7.0 or later. FortiClient versions earlier than 7.0 do not support ZTNA.
 - b. For FortiClient EMS, make sure that ZTNA is enabled. Check the profile on EMS and the endpoint's summary information.
 - c. For licensing, make sure that you have a ZTNA agent license entitlement. Only some license types support ZTNA.
3. If the serial numbers still do not match, deregister FortiClient from EMS, and then connect FortiClient to EMS again to trigger a new certificate signing request.

ZTNA policy mismatch

In most cases, FortiGate denies incoming ZTNA requests because the endpoint FortiClient does not meet the tagging criteria configured in the ZTNA rule and is considered a policy mismatch.

1. On the FortiGate, look at the ZTNA event logs and the forwarded logs.
2. Run the following commands on the ZTNA server:

```
# diagnose wad debug enable category policy
# diagnose wad debug enable level verbose
# diagnose debug enable
```

The command output contains incoming ZTNA requests and the FortiGate process for matching the connection to a ZTNA rule.

3. Verify the zero trust tags for the endpoint:
 - On FortiClient, verify the applied tags. Click the avatar to view the zero trust tags.
 - On FortiClient EMS, verify the endpoint's tags. Go to the endpoint list and click the endpoint.
 - On FortiGate, verify the tags using the following commands:

- Display ZTNA cache data for all endpoints:

```
# diagnose test application fcnacd 7
```

- Display ZTNA cache data for an individual endpoint:

```
# diagnose wad dev query-by uid <UID> <EMS S/N> <tenant ID>
```

4. If the tagging information differs between FortiGate and EMS, examine the EMS tag exchange communication between FortiGate and EMS by looking at the cmNotify and python logs in the debug diagnostics for EMS.

For more information about FortiClient EMS diagnostics, see [Generate Diagnostic Log](#) in the FortiClient EMS Administration Guide.

IP/MAC based access control

In the following ZTNA topology, FortiClient endpoints use VPN to access resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and ZTNA tags to control FortiClient endpoint access to resources.

For more information, see [ZTNA IP MAC based access control example on page 1152](#).

ZTNA tag information missing on the FortiGate

If the IP address for the FortiClient endpoint is not associated with a ZTNA tag on the FortiGate, a firewall policy mismatch occurs, and the FortiGate denies network access to the FortiClient endpoint.

The following workflow summarizes how FortiGate retrieves the IP address and tags for the FortiClient endpoint to help you better understand how to troubleshoot the situation:

1. FortiClient establishes a VPN connection to the FortiGate.
2. FortiGate uses the API to pass FortiClient's UUID and VPN IP address to FortiClient EMS.
3. FortiGate requests system information and tags from FortiClient based on the response from EMS.

Based on the workflow, start troubleshooting before the FortiClient endpoint attempts to establish a VPN connection to FortiGate. On FortiGate, run the following commands:

```
# diagnose debug application fcnacd -1
# diagnose debug console timestamp enable
# diagnose endpoint filter show-large-data yes
# diagnose debug enable
```

The following outputs illustrate how to examine the command output. The output can differ between environments. The outputs help illustrate how to understand the communication between FortiGate and FortiClient EMS.

In the following output, FortiGate's VPN daemon sends FortiClient's UUID and the VPN IP address to FortiClient EMS using the API. The NAC daemon makes the API call to send the details to FortiClient EMS:

```
2022-10-17 08:50:41 [fcems_call_vpn_client_gateway_call:1147] VPN act connect (UID:

2022-10-26 15:59:37.8237471, is_final: True
2022-10-26 11:59:38,543 DEBUG ems_logger 6 7 [UID-Tags e6ecc42c058e48b2b71cf7d65ecd432c
Certificate user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081]
success. uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after: 2022-10-26
15:59:37.8227461, is_final: True

```

FortiGate uses the information from FortiClient EMS to make a targeted API call to FortiClient EMS to retrieve both system information and tag information (with the means of uid_offset and updated_after parameters) for the endpoint. The following is the API call to retrieve the tags from FortiClient EMS:

```

https://172.31.200.182/api/v1/report/fct/uid_tags?sn_list[]=FGVM02TM22018374&updated_
after=2022-10-17 15:59:37.8227461&uid_offset=3358095CFDCB414B9EDA49ADE79AF428

```

The following is an example of the API call and subsequent communication between FortiGate and FortiClient EMS to retrieve tags for the FortiClient endpoint IP address:

```

2022-10-17 08:50:42 [ec_ez_worker_base_prep_resolver:373] Outgoing interface index 0 for 2
(FortiClientEMS).
2022-10-17 08:50:42 [ec_ez_worker_prep_data_url:98] request (26):

```

Other useful CLI commands

Output the JSON-formatted list of FortiGate interfaces (gateways) with IP and MAC addresses. This is the list that FortiGate sends to EMS so that EMS can identify the endpoints that are directly connected to the firewall:

```
# diagnose endpoint fctems json gateway-mac-request
```

Makes EMS execute API calls to the EMS API endpoints on demand:

```
# diagnose test application fcnacd 5
```

Send the gateway list to EMS on demand. It could be useful to execute `diagnose test application fcnacd 5` right after command during troubleshooting, as EMS will have an updated list of firewall interfaces:

```
# diagnose test application fcnacd 99
```

For more commands, see [ZTNA troubleshooting and debugging commands on page 1166](#).

Policy and Objects

This section contains topics on configuring policies and traffic shaping:

- [Policies on page 1176](#)
- [Address objects on page 1302](#)
- [Protocol options on page 1339](#)
- [Traffic shaping on page 1341](#)
- [Internet Services on page 1402](#)

Policies

The firewall policy is the axis around which most features of the FortiGate revolve. Many firewall settings end up relating to or being associated with the firewall policies and the traffic they govern. Any traffic going through a FortiGate has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it is processed, if it is processed, and whether or not it is allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it needs to use, and the time of day. Using this information, the FortiGate firewall attempts to locate a security policy that matches the packet. If a policy matches the parameters, then the FortiGate takes the required action for that policy. If it is *Accept*, the traffic is allowed to proceed to the next step. If the action is *Deny* or a match cannot be found, the traffic is not allowed to proceed.

The two basic actions at the initial connection are either *Accept* or *Deny*:

- If the action is *Accept*, the policy permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the action is *Deny*, the policy blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A *Deny* security policy is needed when it is required to log the denied traffic, also called *violation traffic*.

One other action can be associated with the policy:

- *IPsec*: this is an *Accept* action that is specifically for IPsec VPNs.

Each field in a firewall policy that accepts multiple inputs, such as srcaddr and dstaddr, can accept as many inputs as there are unique objects created. The maximum number of objects depends on the model. See the [Maximum Values Table](#) for more details.

The following topics provide information on the available types of policies and configuration instructions:

- [Firewall policy on page 1177](#)
- [NGFW policy on page 1192](#)
- [Local-in policy on page 1208](#)

- [DoS policy on page 1212](#)
- [Access control lists on page 1219](#)
- [Interface policies on page 1220](#)

The following topics provide instructions on configuring policies:

- [Source NAT on page 1221](#)
- [Destination NAT on page 1239](#)
- [Examples and policy actions on page 1263](#)

Firewall policy

The firewall policy is the axis around which most of the other features of the FortiGate firewall revolve. A large portion of the settings in the firewall at some point will end up relating to or being associated with the firewall policies and the traffic that they govern. Any traffic going through a FortiGate unit has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it's processed, if it's processed, and even whether or not it's allowed to pass through the FortiGate.

The following topics provide information on the firewall policy and configuration:

- [Firewall policy parameters on page 1177](#)
- [Configurations in the GUI on page 1178](#)
- [Configurations in the CLI on page 1183](#)
- [Policy views on page 1188](#)
- [Policy lookup on page 1192](#)

Firewall policy parameters

For traffic to flow through the FortiGate firewall, there must be a policy that matches its parameters:

- Incoming interface(s)
- Outgoing interface(s)
- Source address(es)
- User(s) identity
- Destination address(es)
- Internet service(s)
- Schedule
- Service

Traffic parameters are checked against the configured policies for a match. If the parameters do not match any configured policies, the traffic is denied.

Traffic flow initiated from each direction requires a policy, that is, if sessions can be initiated from both directions, each direction requires a policy.

Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy, there is often reference to the traffic flow, but most communication is two-way so trying to determine the direction of the flow might be confusing. If traffic is HTTP web traffic, the user sends a request to the

website, but most of the traffic flow will be coming from the website to the user or in both directions? For the purposes of determining the direction for a policy, the important factor is the direction of the initiating communication. The user is sending a request to the website, so this is the initial communication; the website is responding so the traffic is from the user's network to the Internet.

FortiOS does not perform a reverse-path check on reply traffic that matches an allowed session based on the IP tuple. The request traffic can be sent on one interface and the reply traffic could return on another interface.

Configurations in the GUI

Firewall policies can be created in the GUI by configuring the necessary parameters.

Incoming interface(s)	This is the interface or interfaces by which the traffic is first connected to the FortiGate unit. The exception being traffic that the FortiGate generates itself. This is not limited to the physical Ethernet ports found on the device. The incoming interface can also be a logical or virtual interface such as a VPN tunnel, a Virtual WAN link, or a wireless interface.
Outgoing interface(s)	This is the interface or interfaces used by traffic leaving a port once it has been processed by the firewall. Similar to incoming interfaces, it is not limited to only physical interfaces.
Source address(es)	The addresses that a policy can receive traffic from can be wide open or tightly controlled. For a public web server that the world at large should be able to access, the best choice will be <i>all</i> . If the destination is a private web server that only the branch offices of a company should be able to access, or a list of internal computers that are the only ones allowed to access an external resource, then a group of preconfigured addresses is the better strategy
User(s) identity	This parameter is based on a user identity that can be from a number of authentication authorities. It will be an account or group that has been set up in advance that can be selected from the drop down menu. The exception to this is the feature that allows the importing of LDAP Users. When the feature is used, a small wizard window will appear to guide the user through the setup. The caveat is that the LDAP server object in the <i>User & Authentication > LDAP Servers</i> section has to be already configured to allow the use of this import feature.
Destination address(es)	In the same way that the source address may need to be limited, the destination address can be used as a traffic filter. When the traffic is destined for internal resources, the specific address of the resource can be defined to better protect the other resources on the network. One of the specialized destination address options is to use a Virtual IP address. If the destination address doesn't need to be internal, you can define policies that are only for connecting to specific addresses on the Internet.
Internet service(s)	In this context, an Internet service is a combination of one or more addresses and one or more services associated with a service found on the Internet such as an update service for software.

Schedule

The time frame that is applied to the policy. This can be something as simple as a time range that the sessions are allowed to start, such as between 8:00 am and 5:00 pm. Something more complex like business hours that include a break for lunch and time of the session's initiation may need a schedule group because it will require multiple time ranges to make up the schedule.

Service

The services chosen represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. This is different than *Application Control* which looks more closely at the packets to determine the actual protocol used to create them.

A case where either side can initiate the communication, like between two internal interfaces on the FortiGate unit, would be a more likely situation to require a policy for each direction.

Enabling advanced policy options in the GUI

Advanced policy options can be enabled so that you can configure the options in the GUI.

To enable advanced policy options:

```
config system settings
    set gui-advanced-policy enable
end
```

Advanced policy options are now available when creating or editing a policy in the GUI:

To enable configuring TCP sessions without SYN:

```
config system settings
    set tcp-session-without-syn enable
end
```

TCP sessions without SYN can now be configured when creating or editing a policy in the GUI:

Add Policy change summary and Policy expiration to Workflow Management

Two options, *Policy change summary* and *Policy expiration*, are included in *Workflow Management*. *Policy change summary* enforces an audit trail for changes to firewall policies. *Policy expiration* allows administrators to set a date for the firewall policy to be disabled.

There are three states for the *Policy change summary*:

- *Disable*: users will not be prompted to add a summary when editing a policy.
- *Required*: the *Policy change summary* will be enabled and will require users to add a summary when editing or creating a firewall policy.
- *Optional*: the *Policy change summary* will be enabled but users can leave the summary empty, if preferred, when editing or creating a firewall policy.

There are three states for *Policy expiration*:

- *Disable*: the firewall policy will not expire. This is the default setting for *Policy expiration*.
- *Default*: the firewall policy will expire after the default number of days.
- *Specify*: the firewall policy will expire at a set date and time.

The default value for *Policy expiration* is 30 days. This number can be changed in the CLI or in *System > Settings* in the GUI to any value between zero and 365 days. If the default value is set to zero, the *Default* state will disable the *Policy expiration*.

To configure the firewall policy change summary and default expiration in the GUI:

1. Go to *System > Feature Visibility*.
2. Enable *Workflow Management*.
3. Click *Apply*.
4. Go to *System > Settings*.
5. In the *Workflow Management* section, set *Policy change summary* to *Required*. *Policies expire by default* is enabled by default with an *Expire after* value of 30.

[Consolidated Policy Configuration](#)

OK Cancel

4. Select the date and time for the policy to expire from the *Expiration date* fields.
5. Click *OK*. The *Workflow Management - Summarize Changes* pane opens.

6. In the *Change summary* field, enter details about the changes made to the policy. These details can be referred to later for auditing purposes.
7. Click *OK*.

To configure the firewall policy change summary in the CLI:

```
config system settings
    set gui-enforce-change-summary {disable | require | optional}
end
```

To configure the policy expiration default value in the CLI:

```
config system settings
    set default-policy-expiry-days <integer>
end
```

To configure firewall policy expiration in the CLI:

```
config firewall policy
    edit <id>
        set policy-expiry {enable | disable}
        set policy-expiry-date <YYYY-MM-DD HH:MM:SS>
    next
end
```

Policy change summaries are used to track changes made to a firewall policy. The *Audit trail* allow users to review the policy change summaries, including the date and time of the change and which user made the change.

To review the audit trail in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Select the policy you want to review and click *Edit*.

3. In the right-side banner, click *Audit Trail*. The *Audit trail for Firewall Policy* pane opens and displays the policy change summaries for the selected policy.

4. Select an entry to review the details of the change made.
5. When you are done reviewing the *Audit Trail*, click *Close*.
6. Click *Cancel* to exit the *Edit Policy* page.

Configurations in the CLI

Firewall policies can be created in the CLI by configuring the necessary parameters. See [Configurations in the GUI on page 1178](#) for more information on the various parameters.

Parameter	Definition
srcintf	Incoming (ingress) interface.
dstintf	Outgoing (egress) interface.
srcaddr	Source IPv4 address and address group names.
dstaddr	Destination IPv4 address and address group names.
internet-service	Enable/disable use of Internet Services for this policy. If enabled, destination address and service are not used.
schedule	Schedule name.
service	Service and service group names.
anti-replay	Enable/disable checking of TCP flags per policy.
match-vip	Enable/disable matching of VIPs when used in a policy with a deny action.
auto-asic-offload	Enable/disable hardware acceleration. Available on select FortiGate models with Secure Processing Unit (SPU) hardware only.
tcp-mss-sender	Sender TCP maximum segment size (MSS).
tcp-mss-receiver	Receiver TCP maximum segment size (MSS).
session-ttl	Time-to-live (TTL) in seconds for session accepted by this policy.

Firewall anti-replay option per policy

When the global anti-replay option is disabled, the FortiGate does not check TCP flags in packets. The per policy anti-replay option overrides the global setting. This allows you to control whether or not TCP flags are checked per policy.

To enable the anti-replay option so TCP flags are checked using the CLI:

```
config firewall policy
  edit 1
    set name "policyid-1"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set anti-replay enable
    set logtraffic all
    set nat enable
  next
end
```

Deny matching with a policy with a virtual IP applied

Preventing hosts with specific source addresses from accessing a server behind the FortiGate may be required in some cases. For this scenario, you should have previously configured a firewall policy with a virtual IP (VIP) object applied to it

to allow such access. See [Destination NAT on page 1239](#) for details.

When denying traffic destined for a typical firewall policy without a VIP applied, you would simply configure a new firewall policy with an action of `deny` and with specific source addresses above the firewall policy that you want to prevent these hosts from accessing. However, the FortiGate matches firewall policies with VIPs applied differently than typical firewall policies. Policies with VIPs applied have priority over typical firewall policies.

Therefore, to block specific source traffic destined for a firewall policy specified with an action of `accept` and with a VIP applied, you should configure `set match-vip enable` on the firewall policy with a `deny` action that has been configured to match traffic before the firewall policy with the VIP applied. By default, new `deny` action firewall policies have `match-vip` enabled.

If the policy action is set to `accept`, `match-vip` cannot be enabled.

To block VIP traffic in a deny policy:

```
config firewall policy
  edit 1
    set name "deny-policy-1"
    set srcintf "wan1"
    set dstintf "lan1"
    set srcaddr "src-hosts-to-deny-access"
    set dstaddr "all"
    set action "deny"
    set schedule "always"
    set service "all"
    set match-vip enable
  next
  edit 2
    set name "vip-policy-1"
    set srcintf "wan1"
    set dstintf "lan1"
    set srcaddr "all"
    set dstaddr "vip-object-1"
    set action "accept"
    set schedule "always"
    set service "ALL"
  next
end
```

Alternatively, to block access to a firewall policy with a VIP applied, you can configure a new VIP object configured with `set src-filter <range>`. Configure a new firewall policy with a `deny` action and with this new VIP applied, and then configure this policy to match traffic before the firewall policy with the same VIP applied with an action of `accept`. In this case, the firewall policy can simply have `set match-vip disable`.

To specify a VIP with source addresses specified with a deny policy:

```
config firewall vip
  edit "vip-with-srcaddr-to-deny"
    set extip "10.1.100.199"
    set extintf "wan1"
    set mappedip "172.16.200.55"
```

```
        set src-filter "1.1.1.1/24"
    next
end
config firewall policy
    edit 3
        set name "deny-policy-3"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-with-srcaddr-to-deny"
        set action "deny"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
end
```

Hardware acceleration

Hardware acceleration is supported on select FortiGate devices and is enabled by default on all firewall policies to ensure optimal performance when processing network traffic traversing the FortiGate. See the [Hardware Acceleration Reference Manual](#) for details.

Typically, hardware acceleration on a specific firewall policy is disabled for one of two purposes:

- To allow CLI commands such as the packet sniffer and debug flow to display all traffic matching the policy since traffic offloaded by SPU hardware on a FortiGate device is not visible by those CLI tools.
- To troubleshoot any possible issues arising by using hardware acceleration.

To disable hardware acceleration in an IPv4 firewall policy:

```
config firewall policy
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in an IPv6 firewall policy:

```
config firewall policy6
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in a multicast firewall policy:

```
config firewall multicast-policy
  edit 1
    set auto-asic-offload disable
  next
end
```

TCP Maximum Segment Size (MSS)

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy, or directly on an interface. See [Interface MTU packet size on page 176](#) for details on configuring TCP MSS directly on an interface.

To configure TCP MSS in a firewall policy:

```
config firewall policy
  edit <policy ID>
    set srcintf "internal"
    set dstintf "wan1"
    set srcaddr "10.10.10.6"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set tcp-mss-sender 1448
    set tcp-mss-receiver 1448
  next
end
```

Adjusting session time-to-live (TTL)

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

The session time-to-live (TTL) parameter determines how long a session of a particular protocol such as TCP, UDP, or ICMP remains in the session table. To ensure proper operation of some devices or applications, the session TTL parameter may need to be increased or decreased to allow sessions to remain active in the session table for a longer or shorter duration, respectively.

To configure a modified session TTL in a firewall policy:

```
config firewall policy
  edit <policy ID>
    set srcintf "internal"
    set dstintf "wan1"
    set srcaddr "10.10.10.6"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set session-ttl 1800
```

```

    next
end

```

The session TTL can be set to zero or `never` to ensure a session never times out. See [No session timeout on page 1285](#) for details.

Session TTL should only be set to zero or `never` after careful consideration of:

- The connected device's or application's requirements for sessions to always stay alive
- The expectation that a connected device or application will use the same session determined by traffic using a fixed source port, fixed destination port, fixed source IP address, and fixed destination IP address.

When session TTL is set to zero or `never`, then sessions will not be cleared from the session table or expire after a specified time unless the CLI commands `diagnose system session filter <filter>` and `diagnose system session clear` are used.

If this setting is used in the case when traffic through a firewall policy can generate numerous unique sessions, then this may have unintended consequences to the FortiGate's memory usage and performance due to the session table constantly growing and not clearing out idle sessions.

To disable session TTL in a firewall policy:

```

config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl never
    next
end

```

Policy views

In *Policy & Objects* policy list pages, there are two policy views: *Interface Pair View* and *By Sequence* view.

Interface Pair View displays the policies in the order that they are checked for matching traffic, grouped by the pairs of incoming and outgoing interfaces in collapsible sections.

v4	l2t.root	port4	Guest-group	all	always	HTTP HTTPS	ACCEPT		NAT	Standard	SSL no
Implicit Deny	any	any	all	all	always	ALL	DENY				

Policy lookup

Firewall policy lookup is based on the `Source_interfaces/Protocol/Source_Address/Destination_Address` that matches the `source-port` and `dst-port` of the protocol. Use this tool to find out which policy matches specific traffic from a number of policies. After completing the lookup, the matching firewall policy is highlighted on the policy list page.

The *Policy Lookup* tool has the following requirements:

- Transparent mode does not support policy lookup function.
- When executing the policy lookup, you need to confirm whether the relevant route required for the policy work already exists.

Sample configuration

This example uses the TCP protocol to show how policy lookup works:

1. On a *Policy & Objects* policy list page, click *Policy Lookup* and enter the traffic parameters.

Create New

2. Click *Search* to display the policy lookup results.

NGFW policy

Profile-based next-generation firewall (NGFW) mode is the traditional mode where you create a profile (antivirus, web filter, and so on) and then apply the profile to a policy.

In policy-based NGFW mode, you allow applications and URL categories to be used directly in security policies, without requiring web filter or application control profiles. However, it is possible to select and apply web filter URL categories and groups.

In policy-based mode:

- Central NAT is always enabled. If no Central SNAT policy exists, you must create one. See [Central SNAT on page 1228](#) for more information.

- Pre-match rules are defined separately from security policies, and define broader rules, such as SSL inspection and user authentication.
- The IPsec wizard is not supported.

If your FortiGate operates in NAT mode, rather than enabling source NAT in individual NGFW policies, go to *Policy & Objects > Central SNAT* and add source NAT policies that apply to all matching traffic. In many cases, you may only need one SNAT policy for each interface pair.

The NGFW mode is set per VDOM, and it is only available when the VDOM inspection mode is flow-based. You can operate your entire FortiGate or individual VDOMs in NGFW policy mode. The application default port can be set as a service port in the NGFW mode using the `default-app-port-as-service` option.

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic. See [Learn mode in security policies in NGFW mode on page 1204](#) for more information.

Enabling policy-based NGFW mode

To enable policy-based NGFW mode without VDOMs in the GUI:

1. Go to *System > Settings*.
2. In *NGFW Mode*, select *Policy-based*.
3. Click *Apply*.

To enable policy-based NGFW mode with VDOMs in the GUI:

1. Go to *System > VDOM*.
2. Double-click a VDOM to edit the settings.
3. In *NGFW Mode*, select *Policy-based*.
4. Click *OK*.

To enable policy-based NGFW mode without VDOMs in the CLI:

```
config system settings
    set ngfw-mode policy-based
end
```

To enable policy-based NGFW mode with VDOMs in the CLI:

```
config vdom
    edit <vdom>
        config system settings
            set ngfw-mode policy-based
        end
    next
end
```

Security and SSL Inspection & Authentication policies

Security policies work with SSL Inspection & Authentication policies to inspect traffic. To allow traffic from a specific user or user group, both Security and SSL Inspection & Authentication policies must be configured. A default SSL Inspection & Authentication policy with the certificate-inspection SSL Inspection profile is preconfigured. Traffic will match the SSL

Inspection & Authentication policy first. If the traffic is allowed, packets are sent to the IPS engine for application, URL category, user, and user group match, and then, if enabled, UTM inspection (antivirus, IPS, DLP, and email filter) is performed.

SSL Inspection & Authentication policies are used to pre-match traffic before sending the packets to the IPS engine:

- There are no schedule or action options; traffic matching the policy is always redirected to the IPS engine.
- SSL inspection, formerly configured in the VDOM settings, is configured in an SSL Inspection & Authentication policy.
- Users and user groups that require authentication must be configured in an SSL Inspection & Authentication policy.

Security policies work with SSL Inspection & Authentication policies to inspect traffic:

- Applications and URL categories can be configured directly in the policy.
- Users and user groups that require authentication must also be configured in a security policy.
- The available actions are *Accept* or *Deny*.
- The *Service* option can be used to enforce the standard port for the selected applications.
- UTM inspection is configured in a security policy.

To configure policies for Facebook and Gmail access in the CLI:

1. Configure an SSL Inspection & Authentication policy:

```
config firewall policy
  edit 1
    set name "Policy-1"
    set srcintf "port18"
    set dstintf "port17"
    set srcaddr "all"
    set dstaddr "all"
    set service "ALL"
    set ssl-ssh-profile "new-deep-inspection"
    set groups "Dev" "HR" "QA" "SYS"
  next
end
```

2. Configure security policies:

```
config firewall security-policy
  edit 2
    set name "allow-QA-Facebook"
    set srcintf "port18"
    set dstintf "port17"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set application 15832
    set groups "Dev" "QA"
  next
  edit 4
    set name "allow-QA-Email"
    set srcintf "port18"
    set dstintf "port17"
    set srcaddr "all"
    set dstaddr "all"

Other NGFW policy-based mode options

You can combine *Application Control* and *Web Filter* in the same NGFW mode policy.

The following security profiles can be used in NGFW policy-based mode:

- AntiVirus
- Web Filter
- Intrusion Prevention
- File Filter
- Email Filter

Logging can also be enabled in security policies.

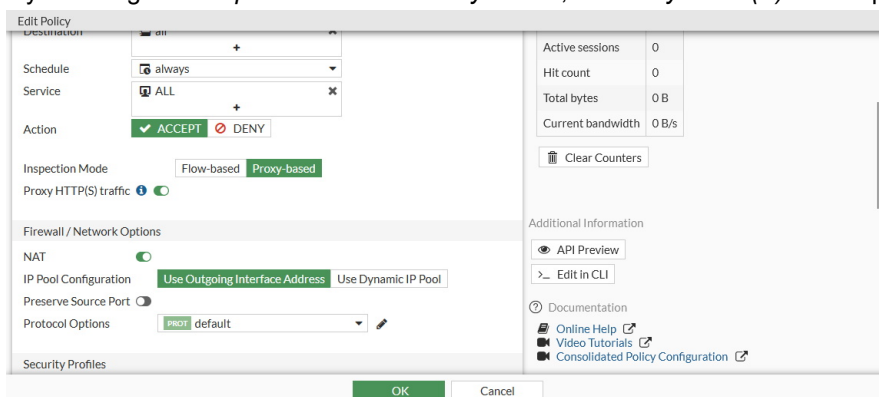

Inspection mode per policy

Inspection mode is configured on a per-policy basis in NGFW mode. This gives you more flexibility when setting up different policies.

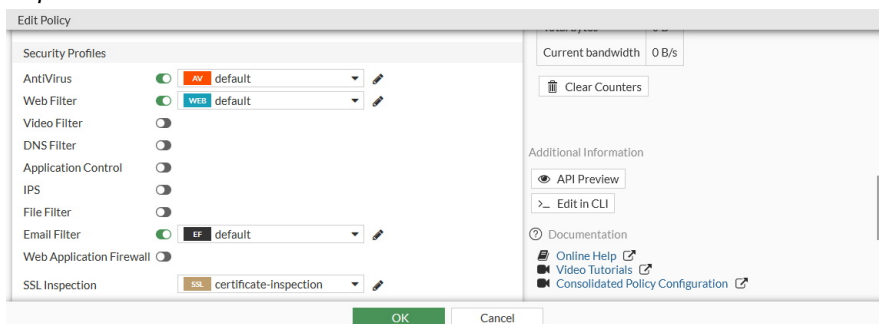

When configuring a firewall policy, you can select a *Flow-based* or *Proxy-based Inspection Mode*. The default setting is *Flow-based*.

To configure inspection mode in a policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a new policy, or edit an existing policy.
3. Configure the policy as needed.
 - a. If you change the *Inspection Mode* to *Proxy-based*, the *Proxy HTTP(S) traffic* option displays.

- b. In the *Security Profiles* section, if no security profiles are enabled, the default *SSL Inspection* is *no-inspection*.
- c. In the *Security Profiles* section, if you enable any security profile, the *SSL Inspection* changes to *certificate-inspection*.

To see the inspection mode changes using the CLI:

```
config firewall policy
  edit 1
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set inspection-mode proxy
    set nat enable
  next
end
```

To see the HTTP and SSH policy redirect settings when inspection mode is set to proxy using the CLI:

```
config firewall policy
  edit 1
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set inspection-mode proxy
    set http-policy-redirect enable
    set ssh-policy-redirect enable
    set nat enable
  next
end
```

To see the default SSL-SSH policy set to no inspection using the CLI:

```
config firewall policy
  edit 1
    show fu | grep ssl-ssh-profile
    set ssl-ssh-profile "no-inspection"
  next
end
```

NGFW policy mode application default service

In NGFW policy-based mode, the application default service enforces applications running only on their default service port. The applications specified in the policy are monitored, and if traffic is detected from a nonstandard port, it is blocked, and a log entry is recorded with a *port-violation* event type.

If you are not using the default ports, and need to pick specific services, select *Specify* to select the required services.

Example

In this example, the standard port is enforced for HTTPS traffic using the HTTP.Audio application.

First, an SSL Inspection & Authentication policy is created do to traffic pre-match, and then a security policy is created to allow the HTTP.Audio application when using the default port. Fetching an MP3 file from an HTTP server using port 443 is allowed, but is blocked when using a nonstandard port, such as 8443.

To enforce the HTTP.Audio application using the default port in the GUI:

1. Create a new SSL Inspection & Authentication policy, or use the default policy.
2. Go to *Policy & Objects > Security Policy*, and click *Create New*.
3. Enter a name for the policy, such as *allow_HTTP.Audio*.
4. Configure the ports as needed.
5. Set *Service* to *App Default*.
6. In the *Application* field, select *HTTP.Audio*.
7. Set the *Action* to *Accept*.

8. Click **OK**.

To enforce the HTTP.Audio application using the default port in the CLI:

1. Create a firewall policy:

```
config firewall policy
  edit 1
    set name "consolidated_all"
    set srcintf "port13"
    set dstintf "port14"
    set srcaddr "all"
    set dstaddr "all"
    set service "ALL"
    set ssl-ssh-profile "new-deep-inspection"
  next
end
```

2. Create a security policy:

```
config firewall security-policy
  edit 1
```

```
        set name "allow_HTTP.Audio"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set enforce-default-app-port enable
        set action accept
        set schedule "always"
        set logtraffic all
        set application 15879
    next
end
```

Logs

The application logs show logs with an event type of `port-violation` for traffic on port 8443 that is blocked, and an event type of `signature` for traffic on port 443 that is allowed.

Blocked:

```
2: date=2019-06-18 time=16:15:40 logid="1060028736" type="utm" subtype="app-ctrl"
eventtype="port-violation" level="warning" vd="vd1" eventtime=1560899740218875746 tz="-0700"
appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=52680 dstport=8443
srcintf="port13" srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6
service="HTTPS" direction="incoming" policyid=1 sessionid=5041 appcat="Video/Audio"
app="HTTP.Audio" action="block" hostname="172.16.200.216" incidentserialno=1906780850
url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Allowed:

```
1: date=2019-06-18 time=16:15:49 logid="1059028704" type="utm" subtype="app-ctrl"
eventtype="signature" level="information" vd="vd1" eventtime=1560899749258579372 tz="-0700"
appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=54527 dstport=443
srcintf="port13" srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6
service="HTTPS" direction="incoming" policyid=1 sessionid=5064 appcat="Video/Audio"
app="HTTP.Audio" action="pass" hostname="172.16.200.216" incidentserialno=1139663486
url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Add option to set application default port as a service port

The `default-app-port-as-service` option can be used in NGFW mode to set the application default port as a service port. This allows applications to match the policy and be blocked immediately the first time that traffic hits the firewall. When this option is enabled, the NGFW policy aggregates the ports used by the applications in the policy and performs a pre-match on the traffic.

```
config system settings
    set default-app-port-as-service {enable | disable}
end
```

This option can be configured on a per-VDOM level.

This setting is enabled by default on new installations. When upgrading, the setting is disabled to retain the previous behavior.

To configure the application default port as service port:**1. Configure the VDOM settings:**

```
config system settings
    set vdom-type traffic
    set opmode nat
    set ngfw-mode policy-based
    set block-land-attack disable
    set default-app-port-as-service enable
    set application-bandwidth-tracking disable
end
```

2. Configure the NGFW policy:

```
config firewall security-policy
    edit 1
        set name "test"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set internet-service-src disable
        set enforce-default-app-port enable
        set action accept
    next
end
```

Sample logs

The following logging behavior occurs in NGFW mode with default-app-port-as-service:

- When default-app-port-as-service and enforce-default-app-port are enabled, traffic that does not match the default port is blocked immediately. Only a traffic log is generated.

Log with SSH and FTP traffic:

```
1: date=2022-02-24 time=11:16:36 eventtime=1645730197145603994 tz="-0800"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="vd1"
srcip=10.1.100.12 srcport=40402 srcintf="port2" srcintfrole="undefined"

```

Application logging in NGFW policy mode

In NGFW policy mode, if an application, application category, or application group is selected on a security policy, and traffic logging is set to *UTM* or *All*, then application control logs will be generated. In addition, when a signature is set to the *ACCEPT* action under a security policy, all corresponding child signatures will be assessed and logged as well.

Under NGFW, with `default-app-port-as-service` enabled, enable APP Default. The traffic which doesn't match the default port will be blocked immediately, and there is only traffic log generated.

Under NGFW, with `default-app-port-as-service` disabled, enable APP Default. The traffic which doesn't match the default port will not be blocked immediately, and there is app and traffic logs generated.

To verify application logging:

1. Go to *Policy & Objects > Security Policy* and configure a new policy for YouTube.
2. Set *Action* to *ACCEPT* and *Log Allowed Traffic* to *Security Events*.

3. Configure the remaining settings as required, then click *OK*.
4. On a client system, play some YouTube videos.
5. On FortiOS, go to *Log & Report > Security Events* and view the *Application Control* logs.

There are logs not only for *YouTube*, but also for *YouTube_Video.Play*, *YouTube_Video.Access*, and so on, as verified from the *Application Name* column.

Date/Time	Source	Destination	Application Name	Action	Application User

Learn mode in security policies in NGFW mode

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic that passes through the source and destination interfaces. The learn mode uses a special prefix in the `polycymode` and `profile` fields in traffic and UTM logs for use by FortiAnalyzer and the Policy Analyzer Management Extension Application (MEA) that is available with FortiManager.

When enabled on FortiManager, Policy Analyzer MEA works with security policies in learning mode to analyze logs sent from a managed FortiGate to FortiAnalyzer. Based on the analyzed traffic, FortiManager administrators can choose to automatically create a policy in FortiManager for the managed FortiGate. For more information about Policy Analyzer MEA, see the [Policy Analyzer Administration Guide](#).

The following limitations apply when learn mode is enabled in a security policy:

- Only interfaces with `device-identification enable` can be used as source interfaces in a security policy with learning mode enabled.
- Incoming and outgoing interfaces do not support `any`.
- Internet service is not supported.
- NAT46 and NAT64 are not supported.
- Users and groups are not supported.
- Some negate options are not supported.

To enable learn mode in the GUI:

1. Enable policy-based NGFW mode:
 - a. Go to *System > Settings*.
 - b. Set the *NGFW Mode* to *Policy-based* and click *Apply*.
2. Go to *Policy & Objects > Security Policy*, and open a security policy for editing.
3. Set the *Policy Mode* to *Learn Mode*.

4. Select an *Incoming Interface*.
5. Select an *Outgoing Interface*.
6. (Optional) Type a comment in the *Comments* box.
7. Toggle on *Enable this policy*.
8. Click *OK* to save the security policy.

To enable learn mode in the CLI:

1. Enable policy-based NGFW mode:

```
config system settings
    set ngfw-mode policy-based
end
```

2. Enable learn mode in a security policy:

```
config firewall security-policy
    edit <id>
        set learning-mode enable
    next
end
```

To view learn mode fields in logs in the CLI:

1. Filter and view fields in traffic logs:

```
# execute log filter category 0
```

```
# execute log display
```

```
1 logs found.
```

```
1 logs returned.
```

```

Local-in policy

While security profiles control traffic flowing through the FortiGate, local-in policies control inbound traffic that is going to a FortiGate interface.

Administrative access traffic (HTTPS, PING, SSH, and others) can be controlled by allowing or denying the service in the interface settings. Trusted hosts can be configured under an administrator to restrict the hosts that can access the administrative service.

Local-in policies allow administrators to granularly define the source and destination addresses, interface, and services. Traffic destined for the FortiGate interface specified in the policy that meets the other criteria is subject to the policies action.

Local-in policies can be used to restrict administrative access or other services, such as VPN, that can be specified as services. You can define source addresses or address groups to restrict access from. For example, by using a geographic type address you can restrict a certain geographic set of IP addresses from accessing the FortiGate. An IP Address threat feed can also be used as either a source or destination address; see [Applying an IP address threat feed in a local-in policy on page 3114](#) for more information.

Local-in policies can only be created or edited in the CLI. You can view the existing local-in policies in the GUI by enabling it in *System > Feature Visibility* under the *Additional Features* section. This page does not list the custom local-in policies.

To configure a local-in policy using the CLI:

```
config firewall {local-in-policy | local-in-policy6}
  edit <policy_number>
    set intf <interface>
    set srcaddr <source_address> [source_address] ...
    set dstaddr <destination_address> [destination_address] ...
    set action {accept | deny}
    set service <service_name> [service_name] ...
    set schedule <schedule_name>
    set comments <string>
  next
end
```

For example, to prevent the source subnet 10.10.10.0/24 from pinging port1, but allow administrative access for PING on port1:

```
config firewall address
  edit "10.10.10.0"
    set subnet 10.10.10.0 255.255.255.0
  next
```

```
end
config firewall local-in-policy
  edit 1
    set intf "port1"
    set srcaddr "10.10.10.0"
    set dstaddr "all"
    set service "PING"
    set schedule "always"
  next
end
```

To test the configuration:

1. From the PC at 10.10.10.12, start a continuous ping to port1:

```
ping 192.168.2.5 -t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter addr 10.10.10.12
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

```
# id=20085 trace_id=1 func=print_pkt_detail line=5746 msg="vd-root:0 received a packet
(proto=1, 10.10.10.12:1->192.168.2.5:2048) from port1. type=8, code=0, id=1, seq=128."
id=20085 trace_id=1 func=init_ip_session_common line=5918 msg="allocate a new session-
0017c5ad"
id=20085 trace_id=1 func=vf_ip_route_input_common line=2615 msg="find a route:
flag=80000000 gw=192.168.2.5 via root"
id=20085 trace_id=1 func=fw_local_in_handler line=474 msg="iprope_in_check() check
failed on policy 1, drop"
```

Implicit deny rule

If a local-in-policy is not functioning correctly and traffic that should be blocked is being allowed through, the issue may be that the implicit deny local-in-policy has not been created. Unlike IPv4 policies, there is no default implicit deny policy. The implicit deny policy should be placed at the bottom of the list of local-in-policies. Local-in-policies are created for each interface, but if you want to create a general implicit deny rule for all interfaces for a specific service, source, address, or destination address, use the `any` interface.

By default, no local-in policies are defined, so there are no restrictions on local-in traffic. When you define a local-in policy, if no action is set manually, then the action will default to `deny`.

For example, to allow only the source subnet 172.16.200.0/24 to ping port1:

```
config firewall address
  edit "172.16.200.0"
    set subnet 172.16.200.0 255.255.255.0
  next
end
config firewall local-in-policy
```

```
edit 2
    set intf "port1"
    set srcaddr "172.16.200.0"
    set dstaddr "all"
    set action accept
    set service "PING"
    set schedule "always"
next
edit 3
    set intf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set service "PING"
    set schedule "always"
next
end
```

To test the configuration:

1. From the PC at 172.16.200.2, start a continuous ping to port1:

```
ping 172.16.200.1 -t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that ping traffic coming from the 172.16.200.0 subnet is allowed:

```
# id=65308 trace_id=25 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.16.200.2:5->172.16.200.1:2048) tun_id=0.0.0.0 from port1. type=8, code=0,

id=5, seq=1."
```

4. From the PC at 172.20.120.13, start a continuous ping to port1:

```
ping 172.16.200.1 -t
```

5. The output of the debug flow shows that ping traffic coming from subnets other than 172.16.200.0 is dropped by local-in policy 3:

```
# id=65308 trace_id=21 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.20.120.13:1->172.16.200.1:2048) tun_id=0.0.0.0 from port2. type=8, code=0,
id=1, seq=8."
id=65308 trace_id=21 func=init_ip_session_common line=6121 msg="allocate a new session-
0002929d, tun_id=0.0.0.0"
id=65308 trace_id=21 func=__vf_ip_route_input_rcu line=2012 msg="find a route:
flag=80000000 gw=0.0.0.0 via root"
id=65308 trace_id=21 func=__iprope_tree_check line=520 msg="gnum=100004, use int hash,
slot=51, len=2"
id=65308 trace_id=21 func=fw_local_in_handler line=545 msg="iprope_in_check() check
failed on policy 3, drop"
```

Additional options

To disable or re-enable the local-in policy, use the `set status {enable | disable}` command.

To dedicate the interface as an HA management interface, use the `set ha-mgmt-intf-only enable` command.

Example:

```
config firewall local-in-policy
edit 1
    set ha-mgmt-intf-only enable
    set intf port4
    set srcaddr all
    set dstaddr all
    set service ALL
    set schedule always
    set action accept
    set status enable
next
end
```

If a user tries to set the HA reserved management interface during the local-in policy an error is generated. Use the `set ha-mgmt-intf-only enable` command to avoid the error.

TTL policies

You can configure a time-to-live (TTL) policy to block attack traffic with high TTLs. This feature only applies to local-in traffic and does not apply to traffic passing through the FortiGate. You can use `srcintf` to set the interface that the local-in traffic hits. See [config firewall ttl-policy](#).

To configure a TTL policy using the CLI:

```
config firewall ttl-policy
edit <id>
    set status {enable | disable}
    set action {accept | deny}
    set srcintf <interface>
    set srcaddr <source_address> [source_address] ...
```

```

        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set ttl <value/range>
    next
end

```

DoS policy

A Denial of Service (DoS) policy examines network traffic arriving at a FortiGate interface for anomalous patterns, which usually indicates an attack.

A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, preventing legitimate users from using it.

DoS policies are checked before security policies, preventing attacks from triggering more resource intensive security protection and slowing down the FortiGate.

DoS anomalies

Predefined sensors are setup for specific anomalous traffic patterns. New DoS anomalies cannot be added by the user.

The predefined anomalies that can be used in DoS policies are:

Anomaly	Description	Recommended Threshold
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_scan	If the UDP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	2000 sessions per second.
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.

Anomaly	Description	Recommended Threshold
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	250 packets per second.
icmp_sweep	If the ICMP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	100 sessions per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.	300 concurrent sessions
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.	1000 concurrent sessions
ip_src_session	If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
ip_dst_session	If the number of concurrent IP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
sctp_flood	If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second
sctp_scan	If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second
sctp_src_session	If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions
sctp_dst_session	If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions

For thresholds based on the number of concurrent sessions, blocking the anomaly will not allow more than the number of concurrent sessions to be set as the threshold.

For example, if the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired the number of allowed sessions that match the anomaly criteria is reset to zero. This means that, if you allow 10 sessions through before blocking, after the 60 seconds has elapsed, another 10 sessions will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

For rate based thresholds, where the threshold is measured in packets per second, the *Block* action prevents anomalous traffic from overwhelming the firewall in two ways:

- continuous: Block packets once an anomaly is detected, and continue to block packets while the rate is above the threshold. This is the default setting.
- periodical: After an anomaly is detected, allow the configured number of packets per second.

For example, if a DoS policy is configured to block icmp_flood with a threshold of 10pps, and a continuous ping is started at a rate of 20pps for 1000 packets:

- In continuous mode, the first 10 packets are passed before the DoS sensor is triggered, and then the remaining 990 packets are blocked.
- In periodical mode, 10 packets are allowed to pass per second, so 500 packets are blocked in the 50 seconds during which the ping is occurring.

The actual numbers of passed and blocked packets may not be exact, as fluctuations in the rates can occur, but the numbers should be close to the defined threshold.

To configure the block action for rate based anomaly sensors:

```
config ips global
    set anomaly-mode {continuous | periodical}
end
```

DoS policies

A DoS policy can be configured to use one or more anomalies.

To configure a DoS policy in the GUI:

1. Go to *Policy & Objects > IPv4 DoS Policy* or *Policy & Objects > IPv6 DoS Policy* and click *Create New*.
If the option is not visible, enable *DoS Policy* in *Feature Visibility*. See [Feature visibility on page 2702](#) for details.

2. Configure the following:

Name	Enter a name for the policy.
Incoming Interface	Enter the interface that the policy applies to.
Source Address	Enter the source address.
Destination Address	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
Service	Select the services or service groups. The ALL service can be used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
L3 Anomalies L4 Anomalies	Configure the anomalies: <ul style="list-style-type: none"> • Logging: Enable/disable logging for specific anomalies or all of them. Anomalous traffic will be logged when the action is <i>Block</i> or <i>Monitor</i>. • Action: Select the action to take when the threshold is reached: <ul style="list-style-type: none"> • <i>Disable:</i> Do not scan for the anomaly. • <i>Block:</i> Block the anomalous traffic. • <i>Monitor:</i> Allow the anomalous traffic, but record a log message if logging is enabled. • Threshold: The number of detected instances that triggers the anomaly action.
Comments	Optionally, enter a comment.

3. Enable the policy, then click **OK**.

The quarantine option is only available in the CLI. See [Quarantine on page 1216](#) for information.

To configure a DoS policy in the GUI:

```
config firewall DoS-policy
edit 1
    set name "Flood"
    set interface "port1"
    set srcaddr "all"
    set dstaddr "all"
    set service "ALL"
    config anomaly
        edit "icmp_flood"
            set status enable
            set log enable
            set action block
            set quarantine attacker
            set quarantine-expiry 1d1h1m
```

```

        set quarantine-log enable
        set threshold 100
    next
end
next
end

```

name <string>	Enter a name for the policy.
interface <string>	Enter the interface that the policy applies to.
srcaddr <string>	Enter the source address.
dstaddr <string>	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
service <string>	Enter the services or service groups. The ALL service can be used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
status {enable disable}	Enable/disable this anomaly.
log {enable disable}	Enable/disable anomaly logging. When enabled, a log is generated whenever the anomaly action is triggered, regardless of which action is configured.
action {pass block}	Set the action to take when the threshold is reached: <ul style="list-style-type: none"> pass: Allow traffic, but record a log message if logging is enabled. block: Block traffic if this anomaly is found.
quarantine {none attacker}	Set the quarantine method (see Quarantine on page 1216): <ul style="list-style-type: none"> none: Disable quarantine. attacker: Block all traffic from the attacker's IP address, and add the attacker's IP address to the banned user list.
quarantine-expiry <###d##h##m>	Set the duration of the quarantine, in days, hours, and minutes (###d##h##m) (1m - 364d23h59m, default = 5m). This option is available if quarantine is set attacker.
quarantine-log {enable disable}	Enable/disable quarantine logging (default = disable). This option is available if quarantine is set attacker.
threshold <integer>	The number of detected instances - packets per second or concurrent session number - that triggers the anomaly action.

Quarantine

Quarantine is used to block any further traffic from a source IP address that is considered a malicious actor or a source of traffic that is dangerous to the network. Traffic from the source IP address is blocked for the duration of the quarantine, and the source IP address is added to the banned user list.

The banned user list is kept in the kernel, and used by Antivirus, Data Leak Prevention (DLP), DoS, and Intrusion Prevention System (IPS). Any policies that use any of these features will block traffic from the attacker's IP address.

To view the quarantined user list:

```
# diagnose user banned-ip list
src-ip-addr      created              expires              cause
192.168.2.205    Wed Nov 25 12:47:54 2020 Wed Nov 25 12:57:54 2020 DOS
```

Troubleshooting DoS attacks

The best way to troubleshoot DoS attacks is with Anomaly logs and IPS anomaly debug messages.

**To test an icmp_flood attack:**

1. From the Attacker, launch an icmp_flood with 50pps lasting for 3000 packets.
2. On the FortiGate, configure continuous mode and create a DoS policy with an icmp_flood threshold of 30pps:

```
config firewall DoS-policy
  edit 1
    set name icmpFlood
    set interface "port1"
    set srcaddr "all"
    set dstaddr "all"
    set service "ALL"
    config anomaly
      edit "icmp_flood"
        set status enable
        set log enable
        set action block
        set threshold 30
      next
    end
  next
end
```

3. Configure the debugging filter:

```
# diagnose ips anomaly config
DoS sensors in kernel vd 0:
DoS id 1 proxy 0
  0 tcp_syn_flood status 0 log 0 nac 0 action 0 threshold 2000
  ...
  7 udp_dst_session status 0 log 0 nac 0 action 0 threshold 5000
  8 icmp_flood status 1 log 1 nac 0 action 7 threshold 30
  9 icmp_sweep status 0 log 0 nac 0 action 0 threshold 100
  ...
total # DoS sensors: 1.
```

```
# diagnose ips anomaly filter id 8
```

4. Launch the `icmp_flood` from a Linux machine. This example uses Nmap:

```
$ sudo nping --icmp --rate 50 -c 3000 192.168.2.50
SENT (0.0522s) ICMP [192.168.2.205 > 192.168.2.50 Echo request (type=8/code=0) id=8597
seq=1] IP [ttl=64 id=47459 iplen=28 ]
...
Max rtt: 11.096ms | Min rtt: 0.028ms | Avg rtt: 1.665ms
Raw packets sent: 3000 (84.000KB) | Rcvd: 30 (840B) | Lost: 2970 (99.00%)
Nping done: 1 IP address pinged in 60.35 seconds
```

5. During the attack, check the anomaly list on the FortiGate:

```
# diagnose ips anomaly list
list nids meter:
id=icmp_flood      ip=192.168.2.50 dos_id=1 exp=998 pps=46 freq=50
```

```
total # of nids meters: 1.
```

id=icmp_flood	The anomaly name.
ip=192.168.2.50	The IP address of the host that triggered the anomaly. It can be either the client or the server. For <code>icmp_flood</code> , the IP address is the destination IP address. For <code>icmp_sweep</code> , it would be the source IP address.
dos_id=1	The DoS policy ID.
exp=998	The time to be expired, in jiffies (one jiffy = 0.01 seconds).
pps=46	The number of packets that had been received when the diagnose command was executed.
freq=50	For session based anomalies, <code>freq</code> is the number of sessions. For packet rate based anomalies (flood, scan): <ul style="list-style-type: none"> In continuous mode: <code>freq</code> is the greater of <code>pps</code>, or the number of packets received in the last second. In periodic mode: <code>freq</code> is the <code>pps</code>.

6. Go to *Log & Report > Security Events* and download the *Anomaly* logs:

```
date=2020-11-20 time=14:38:39 eventtime=1605911919824184594 tz="-0800"
logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
vd="root" severity="critical" srcip=192.168.2.205 srccountry="Reserved"
dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_session"
proto=1 service="PING" count=1307 attack="icmp_flood" icmpid="0x2195"
icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 31 > threshold 30, repeats 28 times"
crscore=50 craction=4096 crlevel="critical"

date=2020-11-20 time=14:39:09 eventtime=1605911949826224056 tz="-0800"
logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
vd="root" severity="critical" srcip=192.168.2.205 srccountry="Reserved"
dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_session"
proto=1 service="PING" count=1497 attack="icmp_flood" icmpid="0x2195"
icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
```

```
ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 50 > threshold 30, repeats 1497 times" crscore=50 craction=4096 crlevel="critical"
```

Analysis

In the first log message:

msg="anomaly: icmp_flood, 31 > threshold 30	At the beginning of the attack, a log is recorded when the threshold of 30pps is broken.
repeats 28 times	The number of packets that has exceeded the threshold since the last time a log was recorded.
srcip=192.168.2.205 dstip=192.168.2.50	The source and destination IP addresses of the attack.
action="clear_session"	Equivalent to block. If action was set to monitor and logging was enabled, this would be action="detected".

In the second log message:

- Because it is an ongoing attack, the FortiGate generates one log message for multiple packets every 30 seconds..
- It will not generate a log message if:
 - The same attack ID happened more than once in a five second period, or
 - The same attack ID happened more than once in a 30 second period and the actions are the same and have the same source and destination IP addresses.

msg="anomaly: icmp_flood, 50 > threshold 30	In the second before the log was recorded, 50 packets were detected, exceeding the configured threshold.
repeats 1497 times	The number of packets that has exceeded the threshold since the last time a log was recorded

Access control lists

An access control list (ACL) is a granular, targeted blocklist that is used to block IPv4 and IPv6 packets on a specified interface based on the criteria configured in the ACL policy.

On FortiGate models with ports that are connected through an internal switch fabric with TCAM capabilities, ACL processing is offloaded to the switch fabric and does not use CPU resources. VLAN interfaces that are based on physical switch fabric interfaces are also supported. Interfaces that are connected through an internal switch fabric usually have names prefixed with *port* or *lan*, such as *port1* or *lan2*; other interfaces are not supported.

The packets will be processed by the CPU when offloading is disabled or not possible, such as when a port on a supported model does not connect to the internal fabric switch.

ACL is supported on the following FortiGate models:

- 100D, 100E, 100EF, 101E
- 140D, 140D-POE, 140E, 140E-POE
- 1500D, 1500DT

- 3000D, 3100D, 3200D, 3700D, 3800D
- All 300E and larger E-series models
- All 100F and larger F-series models

Example

To block all IPv4 and IPv6 telnet traffic from port2 to Company_Servers:

```
config firewall acl
  edit 1
    set interface "port2"
    set srcaddr "all"
    set dstaddr "Company_Servers"
    set service "TELNET"
  next
end
config firewall acl6
  edit 1
    set interface "port2"
    set srcaddr "all"
    set dstaddr "Company_Servers_v6"
    set service "TELNET"
  next
end
```

Diagnose commands

To check the number of packets dropped by an ACL:

```
# diagnose firewall acl counter
ACL id 1 dropped 0 packets

# diagnose firewall acl counter6
ACL id 2 dropped 0 packets
```

To clear the packet drop counters:

```
# diagnose firewall acl clearcounter
# diagnose firewall acl clearcounter6
```

Interface policies

Interface policies are implemented before the security policies and are only flow-based. They are configured in the CLI.

This feature allows you to attach a set of IPS policies with the interface instead of the forwarding path, so packets can be delivered to IPS before entering the firewall. This feature is used for following IPS deployments:

- One-Arm: By defining interface policies with IPS and DoS anomaly checks and enabling sniff-mode on the interface, the interface can be used for one-arm IDS.
- IPv6 IPS: IPS inspection can be enabled through interface IPv6 policy.

- Scan traffic that is destined to the FortiGate.
- Scan and log traffic that are silently dropped or flooded by Firewall or Multicast traffic.

IPS sensors can be assigned to an interface policy. Both incoming and outgoing packets are inspected by IPS sensor (signature).

To configure an interface policy:

```
config firewall interface-policy
    edit 1
        set status enable
        set comments 'test interface policy #1'
        set logtraffic utm
        set interface "port2"
        set srcaddr all
        set dstaddr all
        set service "ALL"
        set application-list-status disable
        set ips-sensor-status disable
        set dsri disable
        set av-profile-status enable
        set av-profile default
        set webfilter-profile-status disable
    next
end
```

Source NAT

The following topics provide instructions on configuring policies with source NAT:

- [Static SNAT on page 1221](#)
- [Dynamic SNAT on page 1222](#)
- [Central SNAT on page 1228](#)
- [Configuring an IPv6 SNAT policy on page 1235](#)
- [SNAT policies with virtual wire pairs on page 1237](#)
- [Configuring PCP port mapping with SNAT and DNAT on page 1297](#)

Static SNAT

Network Address Translation (NAT) is the process that enables a single device such as a router or firewall to act as an agent between the Internet or Public Network and a local or private network. This agent acts in real time to translate the source or destination IP address of a client or server on the network interface. For the source IP translation, this enables a single public address to represent a significantly larger number of private addresses. For the destination IP translation, the firewall can translate a public destination address to a private address. So we don't have to configure a real public IP address for the server deployed in a private network.

We can subdivide NAT into two types: source NAT (SNAT) and destination NAT (DNAT). This topic is about SNAT, We support three NAT working modes: static SNAT, dynamic SNAT, and central SNAT.

In static SNAT all internal IP addresses are always mapped to the same public IP address. This is a port address translation, Since we have 60416 available port numbers, this one public IP address can handle the conversion of

60,416 internal IP addresses to the same service, where a service is defined by a specified protocol, destination IP address, and destination port.

Internal Source IP	Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.1	11111	172.16.200.1	5118
10.1.100.2	11112	172.16.200.1	5119
*****	*****	172.16.200.1	*****
*****	*****	172.16.200.1	65533

FortiGate firewall configurations commonly use the Outgoing Interface address.

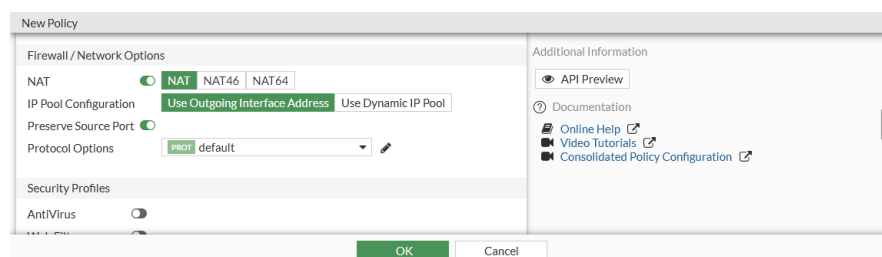

Sample configuration

The following example of static SNAT uses an internal network with subnet 10.1.100.0/24 (vlan20) and an external/ISP network with subnet 172.16.200.0/24 (vlan30).

When the clients in internal network need to access the servers in external network, We need to translate IP addresses from 10.1.100.0/24 to an IP address 172.16.200.0/24, In this example, we implement static SNAT by creating a firewall policy.

To configure static NAT:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the required policy parameters.
3. Enable *NAT* and select *Use Outgoing Interface Address*. For packets that match this policy, its source IP address is translated to the IP address of the outgoing interface.
4. If needed, enable *Preserve Source Port* to keep the same source port for services that expect traffic to come from a specific source port. Disable *Preserve Source Port* to allow more than one connection through the firewall for that service.

5. Click *OK*.

Dynamic SNAT

Dynamic SNAT maps the private IP addresses to the first available public address from a pool of addresses. In the FortiGate firewall, this can be done by using IP pools. IP pools is a mechanism that allows sessions leaving the FortiGate firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses are used instead of the IP address assigned to that FortiGate interface.

IP pool types

FortiGate uses four types of IPv4 IP pools. This topic focuses on some of the differences between them.

Overload

This type of IP pool is similar to static SNAT mode. We need to define an external IP range that contains one or more IP addresses. When there is only one IP address it is almost the same as static SNAT, the outgoing interface address is used. When it contains multiple IP addresses, it is equivalent to an extended mode of static SNAT.

For instance, if we define an overload type IP pool with two external IP addresses (172.16.200.1—172.16.200.2), since there are 60,416 available port numbers per IP, this IP pool can handle 60,416*2 internal IP addresses to the same service, where a service is defined by a specific protocol, destination IP address, and destination port.

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.2	11111	172.16.200.1	5118
*****	*****	172.16.200.1	*****
*****	*****	172.16.200.1	65533
*****	*****	172.16.200.2	5117
*****	*****	*****	*****
*****	*****	172.16.200.2	65533

The mapped IP address can be calculated from the source IP address. The index number of the address in the pool is the remainder of the source IP address, in decimal, divided by the number addresses in the pool.

To calculate the decimal value of the source IP address, either use an online calculator, or use the following equation:

$$a.b.c.d = a * (256)^3 + b * (256)^2 + c * (256) + d$$

For example:

$$192.168.0.1 = 192 * (256)^3 + 168 * (256)^2 + 0 * (256) + 1 = 3232235521$$

If there is one IP pool, where:

- P_1 = the first address in the IP pool
- R_1 = the number of IP addresses in the IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equation to determine the mapped address is:

$$Y = P_1 + X \bmod R_1$$

For example:

IP pool	Source IP address
172.26.73.20 to 172.26.73.90	192.168.1.200

1. Convert the source IP address to a decimal number:

$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$

- Determine the number of IP addresses in the pool:

$$172.26.73.90 - 172.26.73.20 = 71$$

- Find the remainder of the source IP address divided by the number of addresses in the pool:

$$3232235976 \bmod 71 = 26$$

- Add the remainder to the first IP address in the pool:

$$172.26.73.20 + 26 = 172.26.73.46$$

So, the mapped IP address is **172.26.73.46**.

If there are multiple IP pools, the calculation is similar to when there is only one pool.

If there are two IP pools, where:

- P_1 = the first address in the first IP pool
- P_2 = the first address in the second IP pool
- R_1 = the number of IP addresses in the first IP pool
- R_2 = the number of IP addresses in the second IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equations to determine the mapped address are:

$$\text{If } X \bmod (R_1 + R_2) \geq R_1, \text{ then } Y = P_2 + X \bmod R_2$$

$$\text{If } X \bmod (R_1 + R_2) < R_1, \text{ then } Y = P_1 + X \bmod R_1$$

For example:

IP pools	Source IP address
pool01: 172.26.73.20 to 172.26.73.90	192.168.1.200
pool02: 172.26.75.50 to 172.26.75.150	

- Convert the source IP address to a decimal number:

$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$

- Determine the total number of IP addresses in the pools:

$$(172.26.73.90 - 172.26.73.20) + (172.26.75.150 - 172.26.75.50) = 71 + 101 = 172$$

- Find the remainder of the source IP address divided by the number of addresses in the pools:

$$3232235976 \bmod 172 = 108$$

- The remainder is greater than the number of addresses in pool01, so the address is selected from pool02 and the remainder is recalculated based only on pool02:

$$3232235976 \bmod 101 = 40$$

- Add the new remainder to the first IP address in pool02:

$$172.26.75.50 + 40 = 172.26.75.90$$

So, the mapped IP address is **172.26.75.90**.

One-to-one

This type of IP pool means that the internal IP address and the external (translated) IP address match one-to-one. The port address translation (PAT) is disabled when using this type of IP pool. For example, if we define a one-to-one type IP pool with two external IP addresses (172.16.200.1 - 172.16.200.2), this IP pool only can handle two internal IP addresses.

Fixed port range

For the overload and one-to-one IP pool types, we do not need to define the internal IP range. For the fixed port range type of IP pool, we can define both internal IP range and external IP range. Since each external IP address and the number of available port numbers is a specific number, if the number of internal IP addresses is also determined, we can calculate the port range for each address translation combination. So we call this type fixed port range. This type of IP pool is a type of port address translation (PAT).

For instance, if we define one external IP address (172.16.200.1) and ten internal IP addresses (10.1.100.1-10.1.100.10), we have translation IP+Port combination like following table:

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port Range
10.1.100.1	*****	172.16.200.1	5117~11157
10.1.100.2	*****	172.16.200.1	11158~17198
10.1.100.3	*****	172.16.200.1	*****
10.1.100.4	*****	172.16.200.1	*****
10.1.100.5	*****	172.16.200.1	*****
10.1.100.6	*****	172.16.200.1	*****
10.1.100.7	*****	172.16.200.1	*****
10.1.100.8	*****	172.16.200.1	*****
10.1.100.9	*****	172.16.200.1	53445~59485
10.1.100.10	*****	172.16.200.1	59486~65526

Port block allocation

This type of IP pool is also a type of port address translation (PAT). It gives users a more flexible way to control the way external IPs and ports are allocated. Users need to define *Block Size/Block Per User* and external IP range. *Block Size* means how many ports each Block contains. *Block per User* means how many blocks each user (internal IP) can use.

The following is a simple example:

- **External IP Range:** 172.16.200.1—172.16.200.1
- **Block Size:** 128
- **Block Per User:** 8

Result:

- **Total-PBAs:** 472 (60416/128)
- **Maximum ports can be used per User (Internal IP Address):** 1024 (128*8)
- **How many Internal IP can be handled:** 59 (60416/1024 or 472/8)

Sample configuration

When an IP pool object is created with *ARP Reply* enabled, the object does not need to be referenced in any policies before a FortiGate interface starts responding to ARP requests for the addresses in the IP pool.

To configure overload IP pool in the GUI:

1. In *Policy & Objects > IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *Overload*.

3. Enter the external IP range separated by a hyphen (172.16.200.1-172.16.200.1).

New Dynamic IP Pool

IP Pool Type: **IPv4 Pool** | IPv6 Pool

Name: Overload-ippool

Comments: Write a comment... 0/255

Type: **Overload** | One-to-One | Fixed Port Range | Port Block Allocation

External IP address/range: 172.16.200.1-172.16.200.1

Online Help Video Tutorials

4. Click OK.

To configure overload IP pool in the CLI:

```
config firewall ippool
    edit "Overload-ippool"
        set startip 172.16.200.1
        set endip 172.16.200.1
    next
end
```

To configure one-to-one IP pool using the GUI:

1. In *Policy & Objects > IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *One-to-One*.
3. Enter the external IP range separated by a hyphen (172.16.200.1-172.16.200.2).

New Dynamic IP Pool

IP Pool Type: **IPv4 Pool** | IPv6 Pool

Name: One-to-One-ippool

Comments: Write a comment... 0/255

Type: Overload | **One-to-One** | Fixed Port Range | Port Block Allocation

External IP address/range: 172.16.200.1-172.16.200.2

Online Help Video Tutorials

4. Click OK.

To configure one-to-one IP pool in the CLI:

```
config firewall ippool
    edit "One-to-One-ippool"
        set type one-to-one
```

```

        set startip 172.16.200.1
        set endip 172.16.200.2
    next
end

```

To configure fixed port range IP pool in the GUI:

1. In *Policy & Objects > IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *Fixed Port Range*.
3. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*.
4. Enter the internal IP range separated by a hyphen *10.1.100.1-10.1.100.10*.

New Dynamic IP Pool

IP Pool Type: **IPv4 Pool** | IPv6 Pool

Name: FPR-ippool

Comments: Write a comment... 0/255

Type: Overload | One-to-One | **Fixed Port Range** | Port Block Allocation

External IP address/range: 172.16.200.1-172.16.200.1

Internal IP Range: 10.1.100.1-10.1.100.10

Ports Per User: ☐

5. Click **OK**.

To configure fixed port range IP pool in the CLI:

```

config firewall ippool
    edit "FPR-ippool"
        set type fixed-port-range
        set startip 172.16.200.1
        set endip 172.16.200.1
        set source-startip 10.1.100.1
        set source-endip 10.1.100.10
    next
end

```

To configure port block allocation IP pool in the GUI:

1. In *Policy & Objects > IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *Port Block Allocation*.

3. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).

The screenshot shows the 'New Dynamic IP Pool' configuration window. The 'IPv4 Pool' tab is active. The 'Name' field contains 'PBA-ippool'. The 'Comments' field is empty. The 'Type' is set to 'Port Block Allocation'. The 'External IP address/range' is '172.16.200.1-172.16.200.1'. The 'Block Size' is '128'. The 'Blocks Per User' is '8'. The 'ARP Reply' checkbox is checked. The 'OK' button is highlighted in green.

4. Click **OK**.

To configure port block allocation IP pool in the CLI:

```
config firewall ippool
    edit PBA-ippool
        set type port-block-allocation
        set startip 172.16.200.1
        set endip 172.16.200.1
        set block-size 128
        set num-blocks-per-user 8
    next
end
```

Central SNAT

The central SNAT table enables you to define and control (with more granularity) the address translation performed by FortiGate. With the NAT table, you can define the rules for the source address or address group, and which IP pool the destination address uses.

FortiGate reads the NAT rules from the top down until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on source address, destination address, and source port. NAT policies can be rearranged within the policy list. NAT policies are applied to network traffic after a security policy.

The central SNAT table allows you to create, edit, delete, and clone central SNAT entries.

Central SNAT notes

- The central NAT feature is not enabled by default.
- If central NAT is enabled, the NAT option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`. The firewall policy list and dialog boxes have messages and redirection links to show this information.
- If NGFW mode is policy-based, then it is assumed that central NAT (specifically SNAT) is enabled implicitly.

Sample configuration

To enable central SNAT from the GUI:

1. In *System > Settings*, under *System Operations Settings*, enable *Central SNAT*.
2. Click *Apply*.

To enable or disable central SNAT using the CLI:

```
config system settings
    set central-nat {enable | disable}
end
```

When central NAT is enabled, *Policy & Objects* displays the Central SNAT section.

The Central SNAT policy has many options:

Field	Description
Type	Specify whether you are performing SNAT on IPv4 or IPv6. This option only appears when IPv6 is enabled under Feature Visibility.
Incoming Interface	Specify one or more interfaces for the ingress traffic.
Outgoing Interface	Specify one or more interfaces for the egress traffic.
Source Address	Specify the address or address group of the source.
Destination Address	Specify the address or address group of the destination.
NAT	Enable or disable to perform NAT. When disabled, no source address translation will occur.
IP Pool Configuration	Use outgoing interface address: <ul style="list-style-type: none"> • Use the address of the outgoing interfaces as source address. Use Dynamic IP Pool: <ul style="list-style-type: none"> • Choose an IP Pool to perform source NAT.
Protocol	Choose from any, TCP, UDP, SCTP, or specify the protocol number to match. For example, for ICMP, click <i>specify</i> with the protocol number 1.
Explicit port mapping	Enable in order to match this NAT policy only when the following ports are a match: <ul style="list-style-type: none"> • Choose an original source port from one to 65535. NAT'd port will be chosen by the FortiGate based on the IP Pool configuration. Explicit port mapping cannot apply to some protocols which do not use ports, such as ICMP. When enabling a NAT policy which uses Explicit port mapping, always consider that ICMP traffic will not match this policy. When using IP Pools, only the Overload type IP Pool allows Explicit port mapping. When Explicit port mapping is applied, you must define an original source port range and a translated sort port range. The source port will map one to one with the translated port. Refer to Dynamic SNAT to understand how each IP Pool type works.

Field	Description
Comments	Enter comments for this NAT policy.
Enable this policy	Enable or disable this policy.

To configure central SNAT using the CLI:

```
config firewall central-snat-map
  edit <policyID number>
    set status {enable | disable}
    set orig-addr <valid address object preconfigured on the FortiGate>
    set srcintf <name of interface on the FortiGate>
    set dst-addr <valid address object preconfigured on the FortiGate>
    set dstintf <name of interface on the FortiGate>
    set protocol <integer for protocol number>
    set dst-port <integer for destination port or port range>
    set orig-port <integer for original port number>
    set nat-port <integer for translated port number>
    set comments <string>
  next
end
```

Setting the destination port for traffic matching is available when the protocols are TCP, UDP, or SCTP.

Example one

Apply SNAT to all traffic from port2 to port3.

To configure from the CLI:

```
config firewall central-snat-map
  edit 1
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
  next
end
```

Example two

Apply an IP Pool to all traffic from port3 to port2 that are TCP. NAT all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall ippool
  edit "Overload-IPPOOL"
    set startip 192.168.2.201
    set endip 192.168.2.202
```

```

    next
end
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "Overload-IPPOOL"
    next
    edit 2
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end

```

To collect session table output from the CLI:

```
diagnose sys session list
```

The TCP session (protocol 6) is NAT'd with Overload-IPPOOL to 192.168.2.201:

```

session info: proto=6 proto_state=05 duration=14 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=860/7/1 reply=555/8/1 tuples=2
tx speed(Bps/kbps): 60/0 rx speed(Bps/kbps): 38/0
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49531->23.57.57.114:443(192.168.2.201:61776)
hook=pre dir=reply act=dnat 23.57.57.114:443->192.168.2.201:61776(192.168.0.10:49531)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011065 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpd_b_link_id=00000000 rpd_b_svc_id=0 ngfwid=n/a
npu_state=0x040000

```

A UDP session (protocol 17) is NAT'd to the outgoing interface IP address 192.168.2.86:

```

session info: proto=17 proto_state=01 duration=16 expire=163 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=59/1/1 reply=187/1/1 tuples=2
tx speed(Bps/kbps): 3/0 rx speed(Bps/kbps): 11/0
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52177->4.2.2.1:53(192.168.2.86:61770)

```

```
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.86:61770(192.168.0.10:52177)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011061 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpd_b_link_id=000000000 rpd_b_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example three

Apply an IP Pool to all traffic from port3 to port2 that have a specific original port range, mapping the ports to the same NAT'd port range. Nat all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall central-snat-map
  edit 1
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
    set orig-port 50000-65535
    set nat-ippool "Overload-IPPOOL"
    set nat-port 50000-65535
  next
  edit 2
    set srcintf "port3"
    set dstintf "port2"
    set orig-addr "all"
    set dst-addr "all"
  next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

Traffic with original port in the range between 50000-65535 will be NAT'd with the Overload type IP Pool. The mapped port is in the same port range:

```
session info: proto=17 proto_state=01 duration=3 expire=176 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=71/1/1 reply=123/1/1 tuples=2
tx speed(Bps/kbps): 23/0 rx speed(Bps/kbps): 40/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52540->4.2.2.1:53(192.168.2.201:52540)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.201:52540(192.168.0.10:52540)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011399 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
```

```
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Traffic with original port outside the range of 50000-65535 will be NAT'd to the outgoing interface IP:

```
session info: proto=6 proto_state=01 duration=3 expire=3597 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=2262/10/1 reply=2526/11/1 tuples=2
tx speed(Bps/kbps): 741/5 rx speed(Bps/kbps): 828/6
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49805->142.250.68.66:443(192.168.2.86:62214)
hook=pre dir=reply act=dnat 142.250.68.66:443->192.168.2.86:62214(192.168.0.10:49805)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001139a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Protocols which do not use ports, such as ICMP, will be NAT'd to the outgoing interface IP:

```
session info: proto=1 proto_state=00 duration=7 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=480/8/1 reply=480/8/1 tuples=2
tx speed(Bps/kbps): 66/0 rx speed(Bps/kbps): 66/0
origin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:1->4.2.2.1:8(192.168.2.86:62209)
hook=pre dir=reply act=dnat 4.2.2.1:62209->192.168.2.86:0(192.168.0.10:1)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001138b tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example four

In the following example, two central SNAT rules will be created:

- Rule 3 will have a destination port set and IP pool test-ippool4-3 applied.
- Rule 5 will have IP pool test-ippool4-1 applied but will not set the destination port.

Example traffic will then be passed to see how the rule is matched.

To test central SNAT rule destination port support:**1. Configure central SNAT rule 3 with the destination port range specified:**

```
config firewall ippool
    edit "test-ippool4-3"
        set startip 172.16.200.150
        set endip 172.16.200.150
    next
end
config firewall central-snat-map
    edit 3
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "test-ippool4-3"
        set dst-port 80-443
    next
end
```

2. Configure central SNAT rule 5:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.200.151
        set endip 172.16.200.151
    next
end
config firewall central-snat-map
    edit 5
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "test-ippool4-1"
    next
end
```

3. Send HTTP traffic to pass through the FortiGate that is expected to match central SNAT rule 3. IP pool test-ippool4-3 will perform source NAT.**4. Check the session to review for expected behavior:**

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=2 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1800/31/1 reply=77304/60/1 tuples=2
tx speed(Bps/kbps): 602/4 rx speed(Bps/kbps): 25854/206
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24
gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:46731->172.16.200.55:80 (172.16.200.150:46731)
```

```
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.150:46731(10.1.100.42:46731)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=99 pol_uid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003c37 tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason: disabled-by-policy
total session 1
```

5. Send PING traffic to pass through the FortiGate that is expected to match central SNAT rule 5. IP pool test-ippool4-1 will perform source NAT.
6. Check the session to review for expected behavior:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 99/0 rx speed(Bps/kbps): 99/0
origin->sink: org pre->post, reply pre->post dev=24->17/17->24
gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:36732->172.16.200.55:8(172.16.200.151:36732)
hook=pre dir=reply act=dnat 172.16.200.55:36732->172.16.200.151:0(10.1.100.42:36732)
misc=0 policy_id=99 pol_uid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003f62 tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason: disabled-by-policy
total session 1
```

Configuring an IPv6 SNAT policy

IPv4 and IPv6 central SNAT maps are displayed in the same table.

To configure an IPv6 policy with central SNAT in the GUI:

1. Enable central SNAT:
 - a. In the Global VDOM, go to *System > VDOM*.
 - b. Select a VDOM and click *Edit*. The *Edit Virtual Domain Settings* pane opens.
 - c. Enable *Central SNAT*.

- d. Click OK.
2. In the VDOM with central SNAT enabled (FG-traffic in this example), go to *Policy & Objects > Central SNAT* and click *Create New*.
3. Configure the policy settings:
 - a. For *Type*, select *IPv6*.
 - b. Enter the interface, address, and IP pool information.
 - c. Configure the remaining settings as needed.

- d. Click OK.
- The matching SNAT traffic will be handled by the IPv6 central SNAT map.

To configure an IPv6 policy with central SNAT in the CLI:

1. Enable central SNAT:

```
config vdom
  edit FG-traffic
    config system settings
      set central-nat enable
    end
  next
end
```

2. Create an IPv6 central SNAT policy:

```
config vdom
  edit FG-traffic
    config firewall central-snat-map
```

```

        edit 2
            set type ipv6
            set srcintf "wan2"
            set dstintf "wan1"
            set orig-addr6 "all"
            set dst-addr6 "all"
            set nat-ippool6 "test-ippool6-1"
        next
    end
next
end

```

3. Verify the SNAT traffic:

```

(FG-traffic) # diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.602891 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.602942 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 0

SNAT policies with virtual wire pairs

Source NAT (SNAT) can be configured in IPv4 and IPv6 policies with virtual wire pair (VWP) interfaces, and between VWP interfaces when central NAT is enabled.

To configure a policy using SNAT and a VWP interface when central NAT is disabled:

1. Create the VWP interface:

```

config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end

```

2. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```

config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end

```

3. Configure the firewall policy:

```

config firewall policy
    edit 88

```

```
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set ippool enable
        set poolname "vwp-pool-1"
    next
end
```

4. Verify the IP pool functions as expected and traffic passes through:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
23.438095 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
23.438126 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
23.438492 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
23.438501 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply
24.439305 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
24.439319 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
24.439684 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439692 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply

8 packets received by filter
0 packets dropped by kernel
```

To configure a SNAT between VWP interfaces when central NAT is enabled:

1. Enable central NAT:

```
config system settings
    set central-nat enable
end
```

2. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

3. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

4. Configure the SNAT policy:

```
config firewall central-snat-map
  edit 2
    set srcintf "port4"
    set dstintf "port1"
    set orig-addr "all"
    set dst-addr "all"
    set nat-ippool "vwp-pool-1"
  next
end
```

5. Configure the firewall policy:

```
config firewall policy
  edit 90
    set srcintf "port4"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
  next
end
```

Destination NAT

The following topics provide instructions on configuring policies with destination NAT:

- [Configuring PCP port mapping with SNAT and DNAT on page 1297](#)

Static virtual IPs

Static Virtual IPs (VIP) are used to map external IP addresses to internal IP addresses. This is also called destination NAT, where a packet's destination is being NAT'd, or mapped, to a different address.

Static VIPs are commonly used to map public IP addresses to resources behind the FortiGate that use private IP addresses. A static one-to-one VIP is when the entire port range is mapped. A port forwarding VIP is when the mapping is configured on a specific port or port range.

Some of the VIP configuration options are:

Setting	Description
VIP Type	<ul style="list-style-type: none"> IPv4 (<code>config firewall vip</code>) - The source and destination are both IPv4. IPv6 (<code>config firewall vip6</code>) - The source and destination are both IPv6. <p>Note: <i>IPv6</i> is only available when <i>IPv6</i> is enabled in the <i>Feature Visibility</i>.</p>
Interface (<code>extintf</code>)	<p>The external interface that the firewall policy source interface must match.</p> <p>For example, if the external interface is <code>port1</code>, then the VIP can be used in a policy from <code>port1</code> to <code>port3</code>, but not in a policy from <code>port2</code> to <code>port3</code>.</p> <p>If the external interface is <i>any</i>, then the VIP can be used in any firewall policy.</p>
Type (<code>type</code>)	<ul style="list-style-type: none"> Static NAT - Use an external IP address or address range. FQDN - Use an external IP or FQDN address. load-balance (CLI only) - Load balance traffic. server-load-balance - Load balance traffic across multiple servers. SSL processing can be offloaded to the FortiGate. This type of VIP is configure from <i>Policy & Objects > Virtual Servers</i>. dns-translation (CLI only) - DNS translation. access-proxy - Used for ZTNA. See ZTNA HTTPS access proxy example on page 1102 for details.
External IP address/range (<code>extip</code>)	<p>In a static NAT VIP, the external IP address is the IP address that the FortiGate listens for traffic on.</p> <p>When the external interface is not <i>any</i>, <code>0.0.0.0</code> can be used to make the external IP address equivalent to the external interface's IP address.</p> <p>The external IP address is also used to perform SNAT for the mapped server when the server outbound traffic with a destination interface that matches the external interface. The firewall policy must also have NAT enabled.</p>
IPv4 address/range (<code>mappedip</code>)	The IPv4 address or range that the internal resource is being mapped to.
IPv6 address/range (<code>ipv6-mappedip</code>)	The IPv6 address or range that the internal resource is being mapped to.
<code>srcintf-filter</code> (CLI only)	<p>Listen for traffic to the external IP address only on the specified interface.</p> <p>While the external interface restricts the policies where the VIP can be used, it does not restrict listening to only the external interface. To restrict listening to only a specific interface, <code>srcintf-filter</code> must be configured.</p>
<code>nat-source-vip</code> (CLI only)	<p>Force all of the traffic from the mapped server to perform SNAT with the external IP address, regardless of the destination interface.</p> <p>If <code>srcintf-filter</code> is defined, then <code>nat-source-vip</code> only forces SNAT to be performed when the destination matches the <code>srcintf-filter</code> interface.</p> <p>In both cases, the firewall policy must have NAT enabled.</p>
<code>arp-reply</code> (CLI only)	Enable/disable responding to ARP requests on the external IP address (default = enable).

Setting	Description
	When a VIP object is created with <code>arp-reply</code> enabled, the object does not need to be referenced in any policies before a FortiGate interface starts responding to ARP requests for the addresses in the VIP.
Source address (<code>src-filter</code>)	Restrict the source IP address, address range, or subnet that is allowed to access the VIP.
Services (<code>service</code>)	Set the services that are allowed to be mapped.
Port Forwarding (<code>portforward</code>)	Enable port forwarding to specify the port (<code>mappedport</code>) to map to. If no services are configured, you can configure the protocol (<code>protocol</code>) to use when forwarding packets, the external service port range (<code>extport</code>) to be mapped to a port range on the destination network, and the mapped port range (<code>mappedport</code> and <code>ipv6-mappedport</code>) on the destination network.
Port Mapping Type	<ul style="list-style-type: none"> One to one - Each external service port is mapped to one port. A range is allowed, but the number of ports should be the same. Many to Many - The port mapping can be one to one, one to many, or many to one. There are no restrictions on how many external ports must map to internal ports.

Sample configuration

To create a virtual IP in the GUI:

1. In *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. Select a *VIP Type* based on the IP versions used.
3. Enter a unique name for the virtual IP.
4. Enter values for the external IP address/range and map to IPv4/IPv6 address/range fields.

5. Click OK.

To create a virtual IP in the CLI:

```
config firewall vip
    edit "Internal_WebServer"
        set extip 10.1.100.199
        set extintf "any"
        set mappedip "172.16.200.55"
    next
end
```

To apply a virtual IP to policy in the CLI:

```
config firewall policy
    edit 8
        set name "Example_Virtual_IP_in_Policy"
        set srcintf "wan2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Virtual IP with services

Virtual IP with services is a more flexible virtual IP mode. This mode allows users to define services to a single port number mapping.

This topic shows how to use virtual IP with services enabled. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to an internal WebServer TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

To create a virtual IP with services in the GUI:

1. In *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. Set *VIP Type* to *IPv4*.
3. Enter a unique name for the virtual IP and fill in the other fields.
4. Configure the fields in the *Network* section. For example:
 - Set *Interface* to *any*.
 - Set *External IP Address/Range* to *10.1.100.199*.
 - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Enable *Optional Filters* and then enable *Services*.
6. In the *Services* field click + to display the *Services* pane.
7. In the *Services* pane select *TCP_8080*, *TCP_8081*, and *TCP_8082*.
8. Enable *Port Forwarding* and set *Map to IPv4 port* to *80*.

New Virtual IP

VIP type: **IPv4** IPv6

Name: WebServer_VIP_Services

Comments: Write a comment... 0/255

Color: Change

Network

Interface: any

Type: **Static NAT** FQDN

External IP address/range: 10.1.100.199-10.1.100.199

Map to

IPv4 address/range: 172.16.200.55 - 172.16.200.55

IPv6 address/range: Starting IPv6 address

☒ Optional Filters

Source address: ☒

Services: ☒

☒ Port Forwarding

Protocol: **TCP** UDP SCTP ICMP

Port Mapping Type: **One to one** Many to many

External service port: 1 to 65535

Map to IPv4 port: 1 to 65535

Map to IPv6 port: 1 to 65535

OK Cancel

9. Click **OK**.

To see the results:

1. Apply the above virtual IP to the firewall policy.
2. The results are:
 - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
 - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
 - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.55:80 in internal network.

To create a virtual IP with services in the CLI:

```
config firewall vip
  edit "WebServer_VIP_Services"
    set service "TCP_8080" "TCP_8081" "TCP_8082"
    set extip 10.1.100.199
    set extintf "any"
    set portforward enable
    set mappedip "172.16.200.55"
    set mappedport 80
  next
end
```

Virtual IPs with port forwarding

If you need to hide the internal server port number or need to map several internal servers to the same public IP address, enable port-forwarding for Virtual IP.

This topic shows how to use virtual IPs to configure port forwarding on a FortiGate unit. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to different internal WebServers' TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

To create a virtual IP with port forwarding in the GUI:

1. In *Policy & Objects > Virtual IPs*.
2. Click *Create New* and select *Virtual IP*.
3. For *VIP Type*, select *IPv4*.
4. Enter a unique name for the virtual IP and fill in the other fields.
5. Configure the fields in the *Network* section. For example:
 - Set *Interface* to *any*.
 - Set *External IP Address/Range* to *10.1.100.199*.
 - Set *Mapped IP Address/Range* to *172.16.200.55*.
6. Leave *Optional Filters* disabled.
7. Enable *Port Forwarding*.
8. Configure the fields in the *Port Forwarding* section. For example:
 - Set *Protocol* to *TCP*.
 - Set *External Service Port* to *8080*.
 - Set *Map to IPv4 port* to *80*.

9. Click **OK**.
10. Follow the above steps to create two additional virtual IPs.
 - a. For one virtual IP:
 - Use a different *Mapped IP Address/Range*, for example, *172.16.200.56*.
 - Set *External Service Port* to *8081*.
 - Use the same *Map to IPv4 port* number: *80*.
 - b. For the other virtual IP:
 - Use a different *Mapped IP Address/Range*, for example, *172.16.200.57*.
 - Set *External Service Port* to *8082*.
 - Use the same *Map to IPv4 port* number: *80*.
11. Create a *Virtual IP Group* and put the above three virtual IPs into that group.

To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
 - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
 - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.56:80 in internal network.
 - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.57:80 in internal network

Virtual server load balance

This topic shows a special virtual IP type: virtual server. Use this type of VIP to implement server load balancing.

The FortiOS server load balancing contains all the features of a server load balancing solution. You can balance traffic across multiple backend servers based on multiple load balancing schedules including:

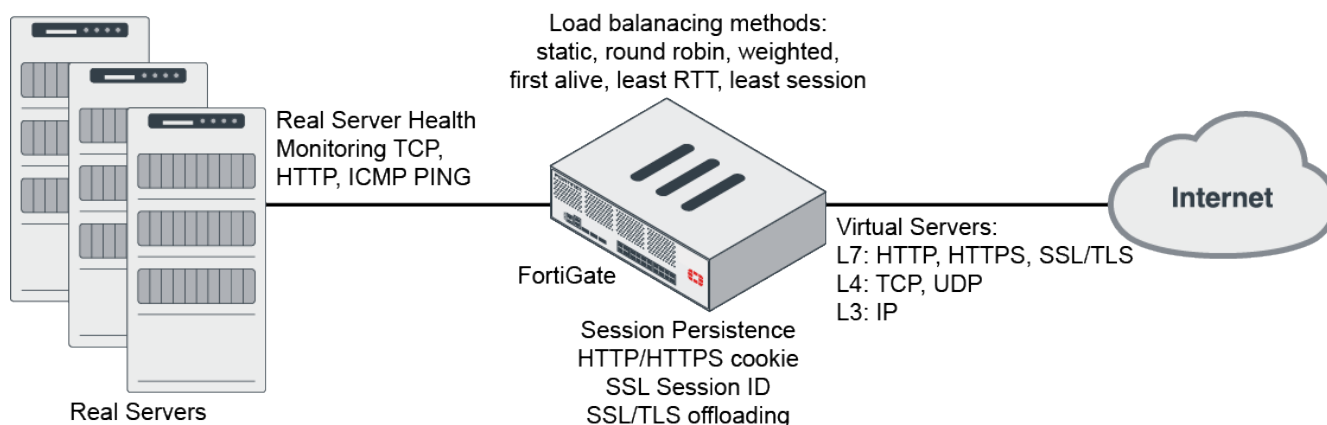

- Static (failover)
- Round robin
- Weighted (to account for different sized servers or based on the health and performance of the server including round trip time and number of connections)

The load balancer supports HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL/TLS, and generic TCP/UDP and IP protocols. Session persistence is supported based on the SSL session ID based on an injected HTTP cookie, or based on the HTTP or HTTPS host. SSL/TLS load balancing includes protection from protocol downgrade attacks. Server load balancing is supported on most FortiGate devices and includes up to 10,000 virtual servers on high end systems.

FortiOS HTTP and HTTPS server load balancing does not support load balancing based on URL routing. You can use FortiWeb server pools or FortiADC server load balancing to load balance sessions to two or more URL based routes.

Sample topology

SSL/TLS offloading

FortiGate SSL/TLS offloading is designed for the proliferation of SSL/TLS applications. The key exchange and encryption/decryption tasks are offloaded to the FortiGate unit where they are accelerated using FortiASIC technology which provides significantly more performance than a standard server or load balancer. This frees up valuable resources on the server farm to give better response to business operations. Server load balancing offloads most SSL/TLS versions including SSL 3.0, TLS 1.0, and TLS 1.2, and supports full mode or half mode SSL offloading with DH key sizes up to 4096 bits.

FortiGate SSL offloading allows the application payload to be inspected before it reaches your servers. This prevents intrusion attempts, blocks viruses, stops unwanted applications, and prevents data leakage. SSL/TLS content inspection supports TLS versions 1.0, 1.1, and 1.2 and SSL versions 1.0, 1.1, 1.2, and 3.0.

Virtual server requirements

When creating a new virtual server, you must configure the following options:

- Virtual Server Type.
- Load Balancing Methods.
- Health check monitoring (optional).
- Session persistence (optional).
- Virtual Server IP (External IP Address).
- Virtual Server Port (External Port).
- Real Servers (Mapped IP Address & Port).

Virtual server types

Select the protocol to be load balanced by the virtual server. If you select a general protocol such as IP, TCP, or UDP, the virtual server load balances all IP, TCP, or UDP sessions. If you select specific protocols such as HTTP, HTTPS, or SSL, you can apply additional server load balancing features such as *Persistence* and *HTTP Multiplexing*.

HTTP	Select <i>HTTP</i> to load balance only HTTP sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced (usually port 80 for HTTP sessions). You can enable <i>HTTP Multiplexing</i> . You can also set <i>Persistence</i> to <i>HTTP Cookie</i> to enable cookie-based persistence.
HTTPS	Select <i>HTTPS</i> to load balance only HTTPS sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced (usually port 443 for HTTPS sessions). You can enable <i>HTTP Multiplexing</i> . You can also set <i>Persistence</i> to <i>HTTP Cookie</i> to enable cookie-based persistence, or you can set <i>Persistence</i> to <i>SSL Session ID</i> .
IMAPS	Select <i>IMAPS</i> to load balance only IMAPS sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced (usually port 993 for IMAPS sessions). You can also set <i>Persistence</i> to <i>SSL Session ID</i> .
POP3S	Select <i>POP3S</i> to load balance only POP3S sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced (usually port 995 for POP3S sessions). You can also set <i>Persistence</i> to <i>SSL Session ID</i> .
SMTPS	Select <i>SMTPS</i> to load balance only SMTPS sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced (usually port 465 for SMTPS sessions). You can also set <i>Persistence</i> to <i>SSL Session ID</i> .
SSL	Select <i>SSL</i> to load balance only SSL sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced. You can also set <i>Persistence</i> to <i>SSL Session ID</i> .
TCP	Select <i>TCP</i> to load balance only TCP sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced.

UDP	Select <i>UDP</i> to load balance only UDP sessions with the destination port number that matches the <i>Virtual Server Port</i> setting. Change <i>Virtual Server Port</i> to match the destination port of the sessions to be load balanced.
IP	Select <i>IP</i> to load balance all sessions accepted by the security policy that contains this virtual server.

Load balancing methods

The load balancing method defines how sessions are load balanced to real servers.

All load balancing methods do not send traffic to real servers that are down or not responding. FortiGate can only determine if a real server is not responding by using a health check monitor. You should always add at least one health check monitor to a virtual server or to real servers; otherwise load balancing might try to distribute sessions to real servers that are not functioning.

Static	The traffic load is statically spread evenly across all real servers. Sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. Because the distribution is stateless, so if a real server is added, removed, or goes up or down, the distribution is changed and persistence might be lost.
Round Robin	Directs new requests to the next real server. This method treats all real servers as equals regardless of response time or the number of connections. This method does not direct requests to real servers that down or non responsive.
Weighted	Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.
Least Session	Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.
Least RTT	Directs sessions to the real server with the lowest round trip time. The round trip time is determined by a ping health check monitor. The default is 0 if no ping health check monitors are added to the virtual server.
First Alive	Directs sessions to the first live real server. This load balancing schedule provides real server failover protection by sending all sessions to the first live real server. If a real server fails, all sessions are sent to the next live real server. Sessions are not distributed to all real servers so all sessions are processed by the first real server only.
HTTP Host	Load balances HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server.

Health check monitoring

In the FortiGate GUI, you can configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts, the load balancer continues to send sessions to it. If a real server stops responding to connection attempts, the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the

load balancer tests real servers. You can use a single health check monitor for multiple load balancing configurations. You can configure TCP, HTTP, DNS, and ping health check monitors. You usually set the health check monitor to use the same protocol as the traffic being load balanced to it. For example, for an HTTP load balancing configuration, you would normally use an HTTP health check monitor.

Session persistence

Use persistence to ensure a user is connected to the same real server every time the user makes an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when users make a purchase, they will be starting multiple sessions as they navigate the eCommerce site. In most cases, all the sessions started by this user during one eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using cookies. HTTP cookie persistence ensure all sessions that are part of the same user session are processed by the same real server.

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

Real servers

Add real servers to a load balancing virtual server to provide information the virtual server requires to send sessions to the server. A real server configuration includes the IP address of the real server and port number the real server receives sessions on. The FortiGate unit sends sessions to the real server's IP address using the destination port number in the real server configuration.

When configuring a real server, you can also specify the weight (if the load balance method is set to *Weighted*) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit automatically switches all further connection requests to other real servers until the connection number drops below the limit. Setting *Maximum Connections* to 0 means that the FortiGate unit does not limit the number of connections to the real server.

Sample of HTTP load balancing to three real web servers

This example describes the steps to configure the load balancing configuration below. In this configuration, a FortiGate unit is load balancing HTTP traffic from the Internet to three HTTP servers on the internal network. HTTP sessions are accepted at the wan1 interface with destination IP address 172.20.120.121 on TCP port 8080, and forwarded from the internal interface to the web servers. When forwarded, the destination address of the session is translated to the IP address of one of the web servers.

This load balancing configuration also includes session persistence using HTTP cookies, round-robin load balancing, and TCP health monitoring for the real servers. Ping health monitoring consists of the FortiGate unit using ICMP ping to ensure the web servers can respond to network traffic.

General steps:

1. Create a health check monitor.
A ping health check monitor causes the FortiGate to ping the real servers every 10 seconds. If one of the servers does not respond within 2 seconds, the FortiGate unit will retry the ping 3 times before assuming that the HTTP server is not responding.
2. Create a load balance virtual server with three real servers.
3. Add the load balancing virtual server to a policy as the destination address.

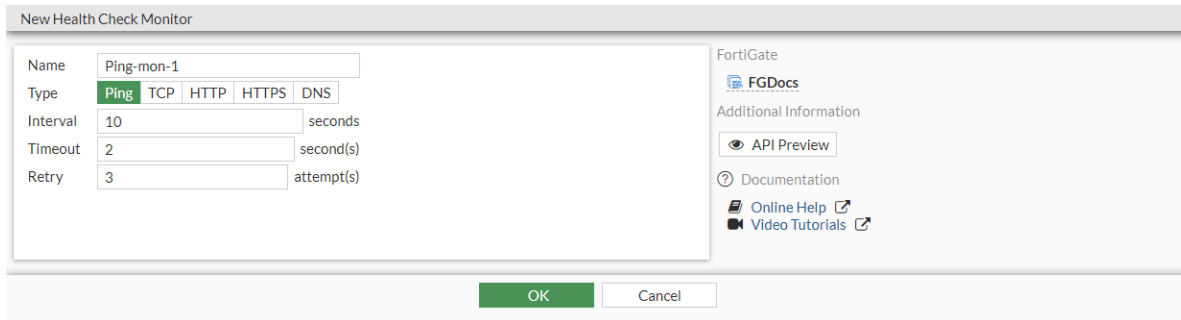

To see the virtual servers and health check monitors options in the GUI, *Load Balance* must be selected in *Feature Visibility > Additional Features*. See [Feature visibility on page 2702](#) on page 1 for details.

Configure a load balancing virtual server in the GUI

To create a health check monitor:

1. Go to *Policy & Objects > Health Check*.
2. Click *Create New*.
3. Set the following:
 - *Name* to *Ping-mon-1*
 - *Type* to *Ping*
 - *Interval* to *10 seconds*
 - *Timeout* to *2 seconds*
 - *Retry* to *3 attempt(s)*

New Health Check Monitor

Name:

Type: **Ping** TCP HTTP HTTPS DNS

Interval: seconds

Timeout: second(s)

Retry: attempt(s)

Real Servers

Address	Port	Max Connections	Mode
No results			

OK Cancel

4. In the *Real Servers* table, click *Create New*.
5. Set the following for the first real server:
 - *Type* to *IP*
 - *IP Address* to *10.31.101.30*
 - *Port* to *80*
 - *Max Connections* to *0*
 - *Mode* to *Active*

6. Click *OK*. Configure two more real servers with IP addresses 10.31.101.40 and 10.31.101.50, and the same settings as the first real server.
7. Click *OK*.

To create a security policy that includes the load balance virtual server as the destination address:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*. The new virtual server will not be available if the inspection mode is *Flow-based*.
4. Set the following:
 - *Name* to *LB-policy*
 - *Incoming Interface* to *wan1*
 - *Outgoing Interface* to *internal*
 - *Source* to *all*
 - *Destination* to *Vserver-HTTP-1*
 - *Schedule* to *always*
 - *Service* to *ALL*
 - *Action* to *ACCEPT*
5. Enable *NAT* and set *IP Pool Configuration* to *Use Outgoing Interface Address*.

6. Enable *AntiVirus* and select an antivirus profile.

7. Click OK.

Configure a load balancing virtual server in the CLI

To configure HTTP load balancing to three real web servers in the CLI:

1. Create a health check monitor:

```
config firewall ldb-monitor
    edit "Ping-mon-1"
        set type ping
        set interval 10
        set timeout 2
        set retry 3
    next
end
```

2. Create a virtual server:

```
config firewall vip
    edit "Vserver-HTTP-1"
        set type server-load-balance
        set extip 172.20.120.121
        set extintf "any"
        set server-type http
        set monitor "Ping-mon-1"
        set ldb-method round-robin
        set persistence http-cookie
```

```
set extport 8080
config realservers
  edit 1
    set type ip
    set ip 10.31.101.30
    set port 80
  next
  edit 2
    set type ip
    set ip 10.31.101.40
    set port 80
  next
  edit 3
    set type ip
    set ip 10.31.101.50
    set port 80
  next
end
next
end
```

3. Add the load balancing virtual server to a policy as the destination address:

```
config firewall policy
  edit 2
    set name "LB-policy"
    set inspection-mode proxy
    set srcintf "wan1"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "Vserver-HTTP-1"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set av-profile "default"
    set fsso disable
    set nat enable
  next
end
```

Results

Traffic accessing 172.20.120.121:8080 is forwarded in turn to the three real servers.

If the access request has an http-cookie, FortiGate forwards the access to the corresponding real server according to the cookie.

Central DNAT

Central NAT allows for the central configuration of SNAT (source NAT) and DNAT (destination NAT).

To enable central NAT in the GUI:

1. Go to *System > Settings*.
2. In the *System Operation Settings*, enable *Central SNAT*.
3. Click *Apply*.

To enable central NAT in the CLI:

```
config system settings
    set central-nat {enable | disable}
end
```

When central NAT is enabled, virtual IPs (VIPs) are not configured in the firewall policy. The VIPs are configured as separate objects where their status must be enabled.

This option is only available for IPv4 VIP and VIP46 objects.

Configuring a DNAT and VIP object in central NAT mode is similar to configuring a VIP when central NAT is disabled. See [Static virtual IPs on page 1239](#) for more information on each setting.

VIP objects can carry over when switching from non-central NAT mode to central NAT mode or vice-versa. However, if a VIP is assigned to a firewall policy in non-central NAT mode, it must be unassigned before switching to central NAT mode.

In this example, a DNAT and VIP are configured to forward traffic from 10.1.100.130 to 172.16.200.44. This example assumes that the firewall address, Addr_172.16.200.44/32, has already been configured.

To configure DNAT and a VIP in the GUI:

1. Configure the VIP:
 - a. Go to *Policy & Objects > DNAT & Virtual IPs* and click *Create New > DNAT & Virtual IP*.
 - b. Enter a name (*test-vip44-1*).
 - c. Set the *External IP address/range* to *10.1.100.130*.
 - d. Set the *Map to IPv4 address/range* to *172.16.200.44*.

OK Cancel

e. Click OK.

2. Configure a firewall policy that allows traffic in the direction of the VIP:

a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.

b. Configure the following settings:

Name	<i>VIP-port2toport3</i>
Source	<i>all</i>
Destination	<i>Addr_172.16.200.40</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>

c. Configure the other settings as needed. There is no SNAT configuration section, so central SNAT policies will be applied.

New Policy

Name: VIP-port2toport3

Incoming Interface: port2

Outgoing Interface: port3

Source: all

IP/MAC Based Access Control: +

Destination: Addr_172.16.200.40

Negate Destination: ☐

Schedule: always

Service: ALL

Action: ☒ ACCEPT ☐ DENY

Documentation

- [Relevant Documentation](#)
- [Video Tutorials](#)
- [Consolidated Policy Configuration](#)

OK Cancel

d. Click OK.

To configure DNAT and a VIP in the CLI:

1. Configure the VIP:

```
config firewall vip
  edit "test-vip44-1"
    set extip 10.1.100.130
    set mappedip "172.16.200.44"
    set extintf "any"
    set status enable
  next
end
```

2. Configure a firewall policy that allows traffic in the direction of the VIP:

```
config firewall policy
  edit 3
    set name "VIP-port2toport3"
    set srcintf "port2"
    set dstintf "port3"
    set action accept
    set srcaddr "all"
    set dstaddr "Addr_172.16.200.40"
    set schedule "always"
    set service "ALL"
  next
end
```

To verify the DNAT and VIP:

If the VIP status is enabled, it will appear in the VIP table:

```
# diagnose firewall iprope list 100000
policy index=7 uuid_idx=625 action=accept
flag (8000104): f_p nat pol_stats
cos_fwd=0 cos_rev=0
group=00100000 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 10.1.100.130-10.1.100.130, uuid_idx=625,
service(1):
    [0:0x0:0/(0,0)->(0,0)] helper:auto
nat(1): flag=0 base=10.1.100.130:0 172.16.200.44-172.16.200.44(0:0)
```

If the VIP status is disabled, it will not appear in the VIP table.

In this example, a one-to-one static NAT is enabled. Send a ping to 10.1.100.130, and the traffic will be forwarded to the destination 172.16.200.44.

Configure FQDN-based VIPs

In public cloud environments, sometimes it is necessary to map a VIP to an FQDN address.

To configure an FQDN-based VIP in the GUI:

1. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
2. Enter a name for the VIP.
3. Select an interface.
4. For *Type*, select *FQDN*.
5. For *External*, select *IP* and enter the external IP address.
6. For *Mapped address*, select an FQDN address.

The screenshot shows the 'New Virtual IP' configuration window in the FortiGate GUI. The configuration is as follows:

- VIP type:** IPv4 (selected), IPv6
- Name:** FQDN-vip-1
- Comments:** Write a comment... (0/255)
- Color:** Change
- Network:**
 - Interface:** any
 - Type:** Static NAT, FQDN (selected)
 - External:** IP, FQDN (selected), 10.2.2.199
 - Mapped address:** destination
- Optional Filters:** Disabled
- Port Forwarding:** Disabled

At the bottom, there are 'OK' and 'Cancel' buttons. The 'OK' button is highlighted in green.

7. Click **OK**.
In the virtual IP list, hover over the address to view more information.

<div> <div>Create New</div> <div>Edit</div> <div>Clone</div> <div>Delete</div> <div>Search</div> </div>				
Name	Details	Interfaces	Services	Ref.
IPv4 Virtual IP 1				
FQDN-vip-1	10.2.2.199 → destination	any		0
<div> <div>Address</div> <div>Type</div> <div>FQDN</div> <div>Interface</div> <div>Resolved To</div> <div>References</div> <div>Edit</div> </div> <div> <div>destination</div> <div>FQDN</div> <div>pc4.qa.fortinet.com</div> <div>any</div> <div>172.16.200.44</div> <div>1</div> </div>				

To configure an FQDN-based VIP in the CLI:

```
config firewall vip
  edit "FQDN-vip-1"
    set type fqdn
    set extip 10.2.2.199
    set extintf "any"
    set mapped-addr "destination"
  next
end
```

Remove overlap check for VIPs

There is no overlap check for VIPs, so there are no constraints when configuring multiple VIPs with the same external interface and IP. A new security rating report alerts users of any VIP overlaps.

To configure two VIPs with the same external interface and IP:

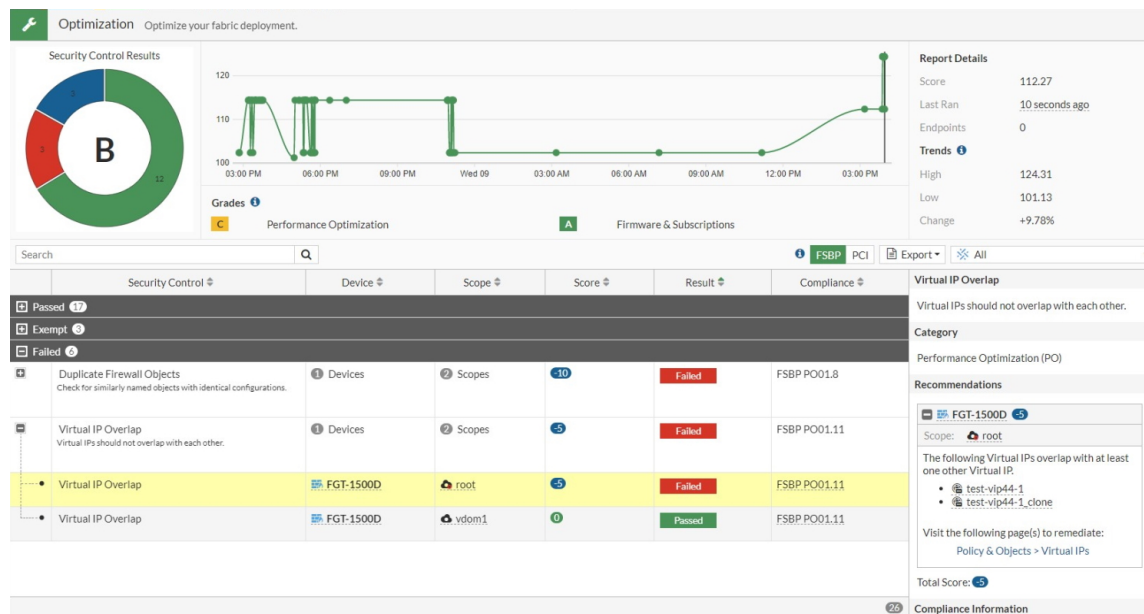

```
config firewall vip
  edit "test-vip44-1"
    set extip 10.1.100.154
    set mappedip "172.16.200.156"
    set extintf "port24"
  next
  edit "test-vip44-1_clone"
    set extip 10.1.100.154
    set mappedip "172.16.200.156"
    set extintf "port24"
    set src-filter 10.1.100.11
  next
end
```

No error message appears regarding the overlapping VIPs.

To view the security rating report:

1. Go to *Security Fabric > Security Rating* and click the *Optimization* scorecard.
2. Expand the *Failed* section. The *Virtual IP Overlap* results show an overlap (*test-vip44-1* and *test-vip44-1_clone*) on the root FortiGate.

VIP groups

Virtual IP addresses (VIPs) can be organized into groups. This is useful in scenarios where there are multiple VIPs that are used together in firewall policies. If the VIP group members change, or a group member's settings change (such as the IP address, port, or port mapping type), then those changes are automatically updated in the corresponding firewall policies.

The following table summarizes which VIP types are allowed and not allowed to be members of a VIP group:

Group type	VIP types allowed as members	VIP types not allowed as members
IPv4	<ul style="list-style-type: none"> Static NAT Load balance DNS translation FQDN 	<ul style="list-style-type: none"> Access proxy Server load balance
IPv6	<ul style="list-style-type: none"> Static NAT 	<ul style="list-style-type: none"> Access proxy Server load balance

Different VIP types can be added to the same group.

To configure a VIP group in the GUI:

1. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP Group*.
2. Set the *Type* to *IPv4* or *IPv6*.
3. Enter a name.

4. Optionally, enter additional information in the *Comments* field.
5. For IPv4 groups, select the *Interface*. Select a specific interface if all of the VIPs are on the same interface; otherwise, select *any*.
6. Click the + in the *Members* field and select the members to add to the group.
7. Click *OK*.

To configure an IPv4 VIP group in the CLI:

```
config firewall vipgrp
  edit <name>
    set interface <name>
    set member <vip1> <vip2> ...
  next
end
```

To configure an IPv6 VIP group in the CLI:

```
config firewall vipgrp6
  edit <name>
    set member <vip1> <vip2> ...
  next
end
```

HTTP2 connection coalescing and concurrent multiplexing for virtual server load balancing

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same.

To configure the load balanced virtual server:

```
config firewall vip
  edit <name>
    set type server-load-balance
    set server-type {http | https}
    set http-multiplex {enable | disable}
    set http-multiplex-ttl <integer>
    set http-multiplex-max-request <integer>
    set http-supported-max-version {http1 | http2}
  next
end
```

http-multiplex {enable disable}	Enable/disable HTTP multiplexing.
http-multiplex-ttl <integer>	Set the time-to-live for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
http-multiplex-max-request <integer>	Set the maximum number of requests that the multiplex server can handle before disconnecting (0 - 2147483647, default = 0).

```
http-supported-max-
  version {http1 |
    http2}
```

Set the maximum supported HTTP version:

- http1: support HTTP 1.1 and HTTP1.
- http2: support HTTP2, HTTP 1.1, and HTTP1 (default).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this session as the multiple streams share the same TLS session to connect to the same destination server.

To configure connection coalescing and concurrent multiplexing with virtual server load balancing:

1. Configure the virtual server:

```
config firewall vip
  edit "vip-test"
    set type server-load-balance
    set extip 10.1.100.222
    set extintf "port2"
    set server-type https
    set extport 443
    config realservers
      edit 1
        set ip 172.16.200.99
        set port 443
      next
    end
    set http-multiplex enable
    set ssl-mode full
    set ssl-certificate "Fortinet_SSL"
  next
end
```

2. Configure the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port3"
```

```

        set action accept
        set srcaddr "all"
        set dstaddr "vip-test"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
        set logtraffic all
        set nat enable
    next
end

```

- Get the clients to access the VIP address (10.1.100.222). The FortiGate shares the first TLS connection with second TLS connection.
- Verify the sniffer packet capture on the FortiGate server side. There is one client hello.

No.	Time	Source	Destination	Protocol	Length	Info

23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

- Disable HTTP multiplexing:

```

config firewall vip
    edit "vip-test"
        config realservers
            edit 1
                set type ip
                set ip 172.16.200.99
                set port 443
            next
        end
    set http-multiplex disable
next
end

```

- Verify the sniffer packet capture. This time, the FortiGate does reuse the TLS connection, so there are two client hellos sent to the real server.

No.	Time	Source	Destination	Protocol	Length	Info
28	2.569066	172.16.200.99	172.16.200.6	TLSv1.3	339	Application Data

- [Configuring PCP port mapping with SNAT and DNAT on page 1297](#)

NAT46 and NAT64 policy and routing configurations

Multiple NAT46 and NAT64 related objects are consolidated into regular objects. A per-VDOM virtual interface, `nafe.vdom`, is automatically added to process NAT46/NAT64 traffic. The features include:

- `vip46` and `vip64` settings are consolidated in `vip` and `vip6` configurations.
- `policy46` and `policy64` settings are consolidated in `firewall policy` settings.
- `nat46/nat64` are included in `firewall policy` settings.
- `ippool` and `ippool6` support NAT46 and NAT64 (when enabled, the IP pool should match a subnet).
- Central SNAT supports NAT46 and NAT64.
- `add-nat46-route` in `ippool6` and `add-nat64-route` in `ippool` are enabled by default. The FortiGate generates a static route that matches the IP range in `ippool6` or `ippool` for the `nafe` tunnel interface.

Automatic processing of the `nafe` tunnel interface is not supported in security policies.

To configure NAT46/NAT64 translation, use the standard `vip/vip6` setting, apply it in a firewall policy, enable NAT46/NAT64, and enter the IP pool to complete the configuration.

The external IP address cannot be the same as the external interface IP address.

Examples

IPv6 must be enabled to configure these examples. In the GUI, so go to *System > Feature Visibility* and enable *IPv6*. In the CLI, enter the following:

```
config system global
    set gui-ipv6 enable
end
```

NAT46 policy

In this example, a client PC is using IPv4 and an IPv4 VIP to access a server that is using IPv6. The FortiGate uses NAT46 to translate the request from IPv4 to IPv6 using the virtual interface `nafe.root`. An `ippool6` is applied so that the request is SNATed to the `ippool6` address (2000:172:16:101::1 - 2000:172:16:101::1).

To create a NAT46 policy in the GUI:

1. Configure the VIP:
 - a. Go to *Policy & Objects > Virtual IPs* and click *Create New > VIP*.
 - b. Enter the following:

VIP type	IPv4
Name	test-vip46-1
Interface	To_vlan20
Type	Static NAT
External IP address/range	10.1.100.150
Map to IPv6 address/range	2000:172:16:200::156

- c. Click **OK**.

2. Configure the IPv6 pool:
 - a. Go to *Policy & Objects > IP Pools* and click *Create New*.
 - b. Enter the following:

IP Pool Type	IPv6 Pool
Name	test-ippool6-1
External IP address/range	2000:172:16:101::1-2000:172:16:101::1
NAT46	Enable

d. Click OK.

To create a NAT46 policy in the CLI:

1. Configure the VIP:

```
config firewall vip
  edit "test-vip46-1"
    set extip 10.1.100.150
    set nat44 disable
    set nat46 enable
    set extintf "port24"
    set arp-reply enable
    set ipv6-mappedip 2000:172:16:200::156
  next
end
```

2. Configure the IPv6 pool:

```
config firewall ippool6
  edit "test-ippool6-1"
    set startip 2000:172:16:101::1
    set endip 2000:172:16:101::1
    set nat46 enable
    set add-nat46-route enable
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 2
    set name "policy46-1"
    set srcintf "port24"
```

```

        set dstintf "port17"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "test-vip46-1"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname6 "test-ippool6-1"
    next
end

```

To verify the traffic and session tables:

1. Verify the traffic by the sniffer packets:

```

(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
2.593302 port24 in 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593344 naf.root out 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593347 naf.root in 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq
1
2.593383 port17 out 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq
1
2.593772 port17 in 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq 1
2.593788 naf.root out 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq
1
2.593790 naf.root in 10.1.100.150 -> 10.1.100.41: icmp: echo reply
2.593804 port24 out 10.1.100.150 -> 10.1.100.41: icmp: echo reply
11 packets received by filter
0 packets dropped by kernel

```

2. Verify the session tables for IPv4 and IPv6:

```

(root) # diagnose sys session list

```

The IPv4 session is between the incoming physical interface port24 and naf.root. The IPv6 session is between the naf.root and the outgoing physical interface port17.

NAT64 policy

In this example, a client PC is using IPv6 and an IPv6 VIP to access a server that is using IPv4. The FortiGate uses NAT64 to translate the request from IPv6 to IPv4 using the virtual interface naf.root. An `ippool` is applied so that the request is SNATed to the `ippool` address (172.16.101.2 - 172.16.101.3).

An embedded VIP64 object is used in this configuration so a specific IPv4 mapped IP does not need to be set. The lower 32 bits of the external IPv6 address are used to map to the IPv4 address. Only an IPv6 prefix is defined. In this example, the IPv6 prefix is 2001:10:1:100::, so the IPv6 address 2001:10:1:100::ac10:c89c will be translated to 172.16.200.156.

To create a NAT64 policy in the GUI:

1. Configure the VIP:
 - a. Go to *Policy & Objects > Virtual IPs* and click *Create New > VIP*.
 - b. Enter the following:

VIP type	IPv6
Name	test-vip64-1
External IP address/range	2000:10:1:100::150
Map to IPv4 address/range	Specify: 172.16.200.156

- c. Click **OK**.
2. Configure the VIP with the embedded IPv4 address enabled:
 - a. Go to *Policy & Objects > Virtual IPs* and click *Create New > VIP*.
 - b. Enter the following:

VIP type	IPv6
Name	test-vip64-2
External IP address/range	2001:10:1:100::-2001:10:1:100::ffff:ffff
Map to IPv4 address/range	Use Embedded

c. Click OK.

3. Configure the IP pool:

- a. Go to *Policy & Objects > IP Pools* and click *Create New*.
- b. Enter the following:

IP Pool Type	IPv4 Pool
Name	test-ippool4-1
Type	Overload
External IP address/range	172.16.101.2-172.16.101.3
NAT64	Enable

c. Click OK.

4. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New* or edit an existing policy.
- b. Enter the following:

c.

Name	policy64-1
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip64-1 test-vip64-2

Schedule	always
Service	ALL
Action	ACCEPT
NAT	NAT64
IP Pool Configuration	test-ippool4-1

- d. Configure the other settings as needed.

Bar chart showing traffic over the last 7 days (Jun 07 to Jun 14). The chart shows a peak in traffic on Jun 09, reaching approximately 4.5 MB. The legend indicates traffic is categorized by nTurbo, SPU, and Software.

Additional Information

- e. Click OK.

To create a NAT64 policy in the CLI:

1. Configure the VIP:

```
config firewall vip6
edit "test-vip64-1"
set extip 2000:10:1:100::150
set nat66 disable
set nat64 enable
set ipv4-mappedip 172.16.200.156
next
end
```

2. Configure the VIP with the embedded IPv4 address enabled:

```
config firewall vip6
edit "test-vip64-2"
set extip 2001:10:1:100::-2001:10:1:100::ffff:ffff
set nat66 disable
set nat64 enable
set embedded-ipv4-address enable
```

```
    next
end
```

3. Configure the IP pool:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.101.2
        set endip 172.16.101.3
        set nat64 enable
        set add-nat64-route enable
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "test-vip64-1" "test-vip64-2"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "test-ippool4-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
20.578417 port24 in 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578495 naf.root out 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578497 naf.root in 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.578854 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.579083 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579093 naf.root out 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579095 naf.root in 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
20.579377 port24 out 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv6 and IPv4:

```
(root) # diagnose sys session6 list

rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason: disabled-by-policy
total session 1
```

The IPv6 session is between the incoming physical interface port24 and naf.root. The IPv4 session is between the naf.root and the outgoing physical interface port17.

3. Verify the embedded VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
```

```

7.696010 port24 in 2000:10:1:100::41 -> 2001:10:1:100::ac10:c89c: icmp6: echo request

11 packets received by filter
0 packets dropped by kernel

```

Mirroring SSL traffic in policies

SSL mirroring allows the FortiGate to decrypt and mirror traffic to a designated port. A new decrypted traffic mirror profile can be applied to IPv4, IPv6, and explicit proxy firewall policies in both flow and proxy mode. Full SSL inspection must be used in the policy for the traffic mirroring to occur.

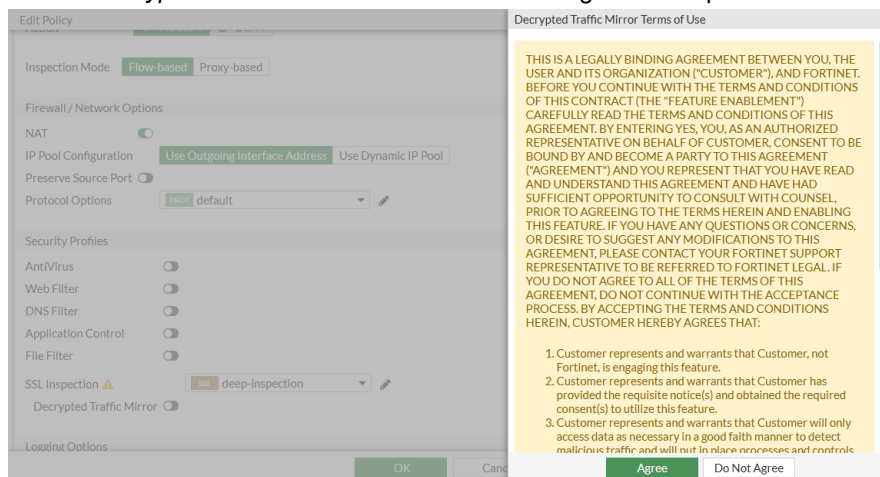

SSL inspection is automatically enabled when you enable a security profile on the policy configuration page.

To configure SSL mirroring in a policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a new policy, or edit an existing one.
3. Configure the interfaces, sources, and other required information.
4. In the *Security Profiles* section, for *SSL Inspection*, select *deep-inspection*, or another profile that uses *Full SSL Inspection*.

5. Enable *Decrypted Traffic Mirror*. The terms of use agreement opens.

6. Click *Agree* to accept the terms.

7. In the drop-down list, select a decrypted traffic mirror, or click *Create* to create a new one. In this example, a new decrypted traffic mirror is created using the port3 interface.

8. Click *OK* to save the policy.

To configure SSL mirroring in proxy mode in the CLI:

1. Create the decrypted traffic mirror profile:

```
config firewall decrypted-traffic-mirror
  edit SSL-to-port3
    set dstmac ff:ff:ff:ff:ff:ff
    set traffic-type ssl
    set traffic-source client
    set interface port3
  next
end
```

2. Configure the policy to enable SSL traffic mirroring:

```
config firewall policy
  edit 1
    set name "mirror-policy"
    set srcintf "port1"
    set dstintf "port2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
```

```
set ssl-ssh-profile "deep-inspection"  
set decrypted-traffic-mirror "SSL-to-port3"
```

THIS IS A LEGALLY BINDING AGREEMENT BETWEEN YOU, THE USER AND ITS ORGANIZATION ("CUSTOMER"), AND FORTINET. BEFORE YOU CONTINUE WITH THE TERMS AND CONDITIONS OF THIS CONTRACT (THE "FEATURE ENABLEMENT") CAREFULLY READ THE TERMS AND CONDITIONS OF THIS AGREEMENT. BY ENTERING YES, YOU, AS AN AUTHORIZED REPRESENTATIVE ON BEHALF OF CUSTOMER, CONSENT TO BE BOUND BY AND BECOME A PARTY TO THIS AGREEMENT ("AGREEMENT") AND YOU REPRESENT THAT YOU HAVE READ AND UNDERSTAND THIS AGREEMENT AND HAVE HAD SUFFICIENT OPPORTUNITY TO CONSULT WITH COUNSEL, PRIOR TO AGREEING TO THE TERMS HEREIN AND ENABLING THIS FEATURE. IF YOU HAVE ANY QUESTIONS OR CONCERNS, OR DESIRE TO SUGGEST ANY MODIFICATIONS TO THIS AGREEMENT, PLEASE CONTACT YOUR FORTINET SUPPORT REPRESENTATIVE TO BE REFERRED TO FORTINET LEGAL. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, DO NOT CONTINUE WITH THE ACCEPTANCE PROCESS. BY ACCEPTING THE TERMS AND CONDITIONS HEREIN, CUSTOMER HEREBY AGREES THAT:

1. Customer represents and warrants that Customer, not Fortinet, is engaging this feature.
2. Customer represents and warrants that Customer has provided the requisite notice(s) and obtained the required consent(s) to utilize this feature.
3. Customer represents and warrants that Customer will only access data as necessary in a good faith manner to detect malicious traffic and will put in place processes and controls to ensure this occurs.
4. Customer represents and warrants that Customer has the right to enable and utilize this feature, and Customer is fully in compliance with all applicable laws in so doing.
5. Customer shall indemnify Fortinet in full for any of the above certifications being untrue.
6. Customer shall promptly notify Fortinet Legal in writing of any breach of these Terms and Conditions and shall indemnify Fortinet in full for any failure by Customer or any of its employees or representatives to abide in full by the Terms and Conditions above.
7. Customer agrees that these Terms and Conditions shall be governed by the laws of the State of California, without regards to the choice of laws provisions thereof and Customer hereby agrees that any dispute related to these Terms and Conditions shall be resolved in Santa Clara County, California, USA, and Customer hereby consents to personal jurisdiction in Santa Clara County, California, USA.

Recognize anycast addresses in geo-IP blocking

An anycast IP can be advertised from multiple locations and the router selects a path based on latency, distance, cost, number of hops, and so on. This technique is widely used by providers to route users to the closest server. Since the IP is hosted in multiple geographic locations, there is no way to specify one single location to that IP.

Anycast IP address ranges can be bypassed in geo-IP blocking. The ISDB contains a list of confirmed anycast IP ranges that can be used for this purpose.

When the source or destination is set to `geoip`, you can enable the `geoip-anycast` option. Once enabled, IPs where the `anycast` option is set to 1 in `geoip_db` are bypassed in country matching and blocking.

You can only use the CLI to configure this feature.

To enable the `geoip-anycast` option using the CLI:

```
config firewall policy
  edit 1
    set name "policyid-1"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "test-geoip-CA_1"
    set action accept
    set schedule "always"
    set service "ALL"
    set geoip-anycast enable
    set logtraffic all
    set nat enable
  next
end
```

To check the `geoip-anycast` option for an IP address using the CLI:

```
diagnose geoip ip2country 1.0.0.1
1.0.0.1 - Australia, is anycast ip
```

The anycast IP is 1.0.0.1.

Matching GeoIP by registered and physical location

IP addresses have both a physical and registered location in the geography IP database. Sometimes these two locations are different. The `geoip-match` command allows users to match an IPv4 address in an firewall policy to its physical or registered location when a GeoIP is used as a source or destination address. IPv6 policies currently support geography address objects but do not support `geoip-match`.

In the following example, the physical location of 220.243.219.10 is CA (Canada), the registered location is CN (China), and it is not an anycast IP.

To configure GeoIP matching based on registered location:

1. Create a firewall policy to match the IP:

```
config firewall policy
  edit 1
    set name "policy_id_1"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
```

```

        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match registered-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end

```

Since CA is applied as a destination address and registered location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will be blocked because the registered location is CN.

2. Verify that the policy is blocking traffic from the IP address:

```

# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.383798 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.381982 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.382608 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
^C
3 packets received by filter
0 packets dropped by kernel

```

To configure GeoIP matching based on physical location:

1. Create a firewall policy to match the IP:

```

config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match physical-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end

```

Since CA is applied as a destination address and physical location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will pass through.

2. Verify that the policy is allowing traffic from the IP address:

```

# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.273985 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
5.274176 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
6.274426 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.274438 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request

```

```
7.273978 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.273987 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
^C
6 packets received by filter
0 packets dropped by kernel
```

HTTP to HTTPS redirect for load balancing

You can configure a virtual server with HTTP to HTTPS redirect enabled. When enabled, a virtual server can convert a client's HTTP requests to HTTPS requests. Through this mandatory conversion, HTTP traffic is converted to HTTPS traffic. This conversion improves the security of the user network.

You can only enable this feature by using the CLI. After you enable this feature, traffic flows as follows:

- When FortiGate receives an HTTP request for an external IP, such as 10.1.100.201 in the following example, FortiGate sends an HTTP 303 response back to the original client and redirects HTTP to HTTPS, instead of forwarding the HTTP request to the real backend servers.
- The client browser restarts the TCP session to HTTPS.
- The HTTPS session comes to the FortiGate where a matching firewall policy allows the HTTPS traffic and establishes a secure SSL connection, and then forwards the request to the real backend servers.

To configure virtual server with HTTPS redirect enabled:

1. Create a virtual server with `server-type` set to `http`:

```
config firewall vip
    edit "virtual-server-http"
        set type server-load-balance
        set extip 10.1.100.201
        set extintf "wan2"
        set server-type http
        set ldb-method round-robin
        set extport 80
        config realservers
            edit 1
                set ip 172.16.200.44
                set port 80
            next
            edit 2
                set ip 172.16.200.55
                set port 80
            next
        end
    end
next
end
```

2. Create a virtual server with `server-type` set to `https` and with the same external IP address:

```
config firewall vip
    edit "virtual-server-https"
        set type server-load-balance
        set extip 10.1.100.201
        set extintf "wan2"
        set server-type https
        set ldb-method round-robin
        set extport 443
        config realservers
            edit 1 set ip 172.16.200.44
```

```
        set port 443
    next
    edit 2
        set ip 172.16.200.55
        set port 443
    next
end
set ssl-certificate "Fortinet_CA_SSL"
next
end
```

3. Enable the `http-redirect` option for the virtual server with `server-type` set to `http`:

```
config firewall vip
    edit "virtual-server-http"
        set http-redirect enable
    next
end
```

4. Add the two virtual servers to a policy:

```
config firewall policy
    edit 9
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "virtual-server-http" "virtual-server-https"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Use Active Directory objects directly in policies

Active Directory (AD) groups can be used directly in identity-based firewall policies. You do not need to add remote AD groups to local FSSO groups before using them in policies.

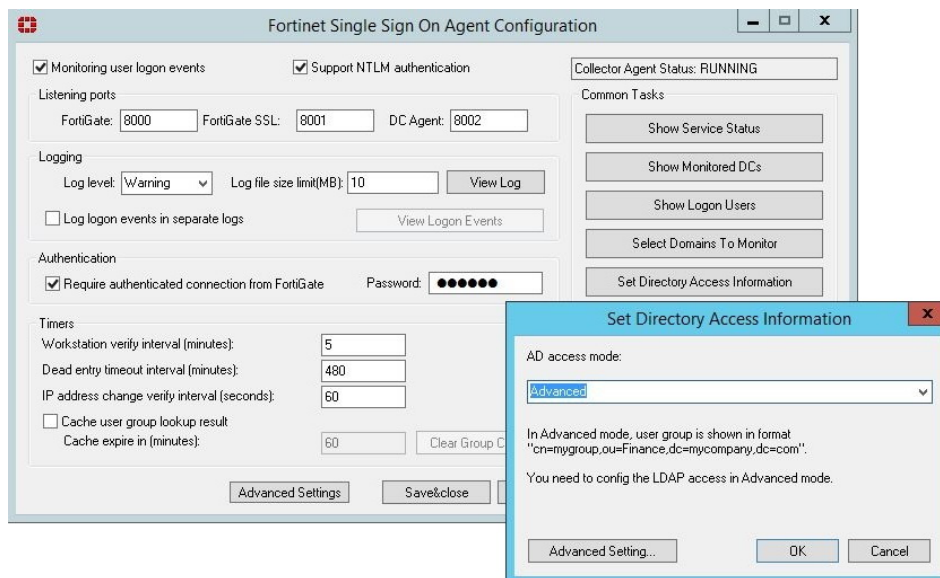

FortiGate administrators can define how often group information is updated from AD LDAP servers.

To retrieve and use AD user groups in policies:

1. [Set the FSSO Collector Agent AD access mode on page 1281](#)
2. [Add an LDAP server on page 1282](#)
3. [Create the FSSO collector that updates the AD user groups list on page 1283](#)
4. [Use the AD user groups in a policy on page 1284](#)

Set the FSSO Collector Agent AD access mode

To use this feature, you must set FSSO Collector Agent to *Advanced* AD access mode. If the FSSO Collector Agent is running in the default mode, FortiGate cannot correctly match user group memberships.

Add an LDAP server

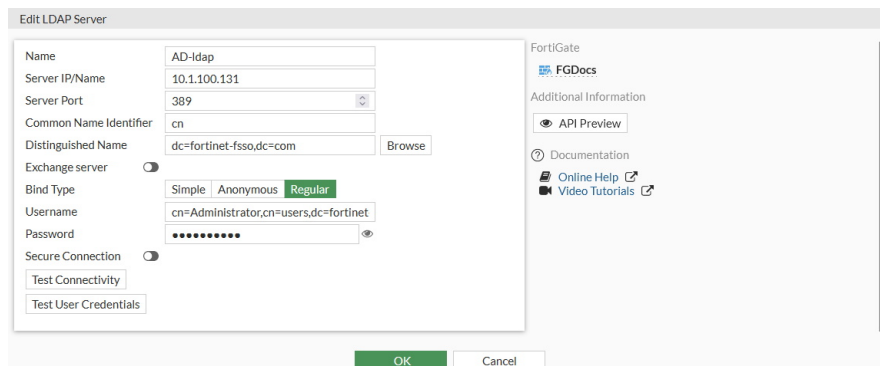

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 2242](#) and [Configuring client certificate authentication on the LDAP server on page 2256](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

To add an LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the settings as needed.

4. If secure communication over TLS is supported by the remote AD LDAP server:

- a. Enable *Secure Connection*.
- b. Select the protocol.
- c. Select the certificate from the CA that issued the AD LDAP server certificate.

If the protocol is LDAPS, the port will automatically change to 636.

5. Click *OK*.

To add an LDAP server in the CLI:

```
config user ldap
  edit "AD-ldap"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password XXXXXXXXXXXXXXXXXXXXXXXXXX
  next
end
```

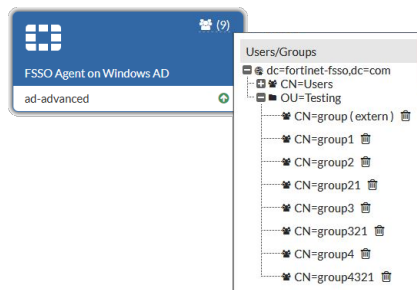

Create the FSSO collector that updates the AD user groups list

To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.
4. Fill in the *Name*
5. Set the *Primary FSSO Agent* to the IP address of the FSSO Collector Agent, and enter its password.
6. Set the *User Group Source* to *Local*.
7. Set the *LDAP Server* to the just created *AD-ldap* server.
8. Enable *Proactively Retrieve from LDAP Server*.
9. Set the *Search Filter* to *(&(objectClass=group)(cn=group*))*.
The default search filter retrieves all groups, including Microsoft system groups. In this example, the filter is configured to retrieve *group1*, *group2*, etc, and not groups like *grp199*.
The filter syntax is not automatically checked; if it is incorrect, the FortiGate might not retrieve any groups.
10. Set the *Interval (minutes)* to configure how often the FortiGate contacts the remote AD LDAP server to update the group information.

11. Click OK.

12. To view the AD user groups that are retrieved by the FSSO agent, hover the cursor over the group icon on the fabric connector listing.

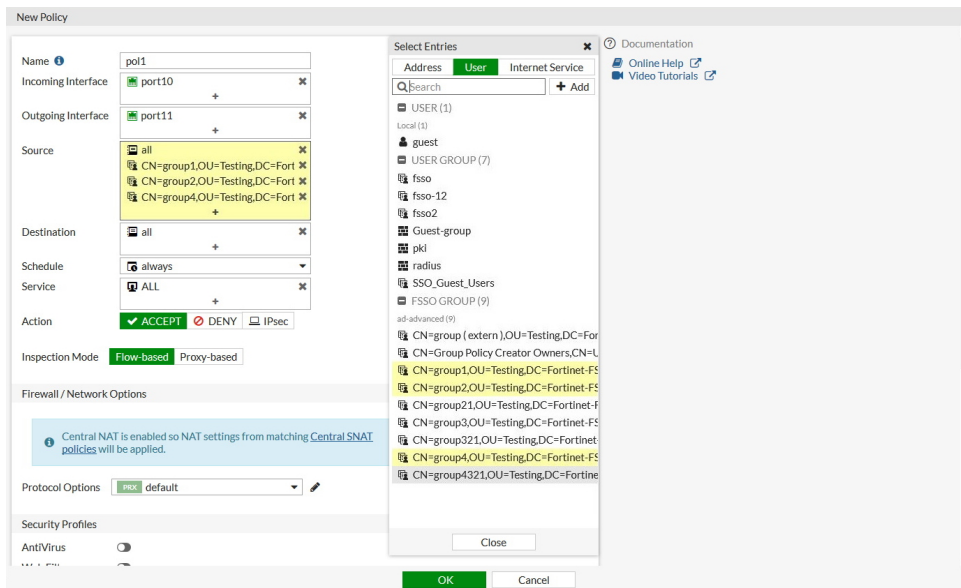

To create an FSSO agent connector in the CLI:

```
config user fsso
  edit "ad-advanced"
    set server "10.1.100.131"
    set password XXXXXXXXXXXXXXXX
    set ldap-server "AD-ldap"
    set ldap-poll enable
    set ldap-poll-interval 2
    set ldap-poll-filter "(&(objectClass=group)(cn=group*))"
  next
end
```

You can view the retrieved AD user groups with the `show user adgrp` command.

Use the AD user groups in a policy

The AD user groups retrieved by the FortiGate can be used directly in firewall policies.

No session timeout

To allow clients to permanently connect with legacy medical applications and systems that do not have keepalive or auto-reconnect features, the session timeout can be set to never for firewall services, policies, and VDOMs.

The options to disable session timeout are hidden in the CLI.

To set the session TTL value of a custom service to never:

```
config firewall service custom
  edit "tcp_23"
    set tcp-portrange 23
    set session-ttl never
  next
end
```

To set the session TTL value of a policy to never:

```
config firewall policy
  edit 201
    set srcintf "wan1"
    set dstintf "wan2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "TCP_8080"
    set logtraffic disable
    set session-ttl never
    set nat enable
  next
end
```

To set the session TTL value of a VDOM to never:

```

config system session-ttl
    set default never
    config port
        edit 1
            set protocol 6
            set timeout never
            set start-port 8080
            set end-port 8080
        next
    end
end

```

To view a session list with the timeout set to never:

```

# diagnose sys session list

session info: proto=6 proto_state=01 duration=9 expire=never timeout=never flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=3

```

MAP-E support

On a customer edge (CE) FortiGate, an IPv4-over-IPv6 (MAP-E) tunnel can be created between the FortiGate and the border relay (BR) operating in an IPv6 network. A tunnel interface is created between the FortiGate and BR, which can be applied to firewall policies and IPsec VPN.

To configure a MAP-E tunnel between the FortiGate and the BR:

1. Configure fixed IP mode.
 - a. Configure IPv6 on the interface:

```
config system interface
  edit "wan1"
    config ipv6
      set autoconf enable
      set unique-autoconf-addr enable
      set interface-identifier ::6f:6clf:3400:0
    end
  next
end
```

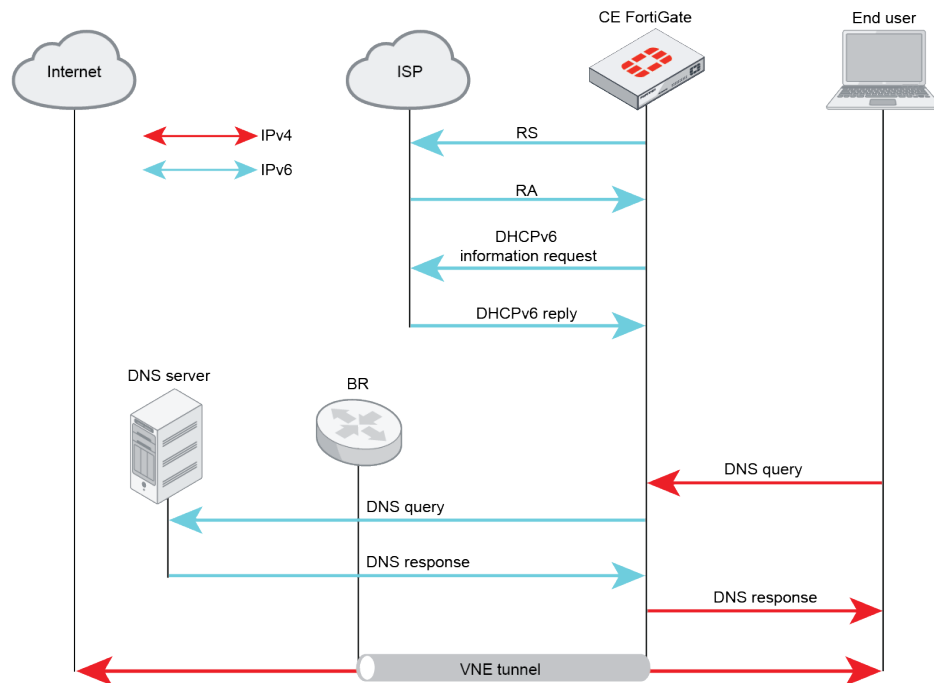

The `interface-identifier` is an IPv6 address. Its last 64-bit will be kept and the rest will be cleared automatically. It will combine with the IPv6 prefix it gets from the IPv6 router to generate the IPv6 address of the interface.

By default, `unique-autoconf-addr` is disabled. It must be enabled so it can handle IPv6 prefix changing.

- b. Configure the VNE tunnel:

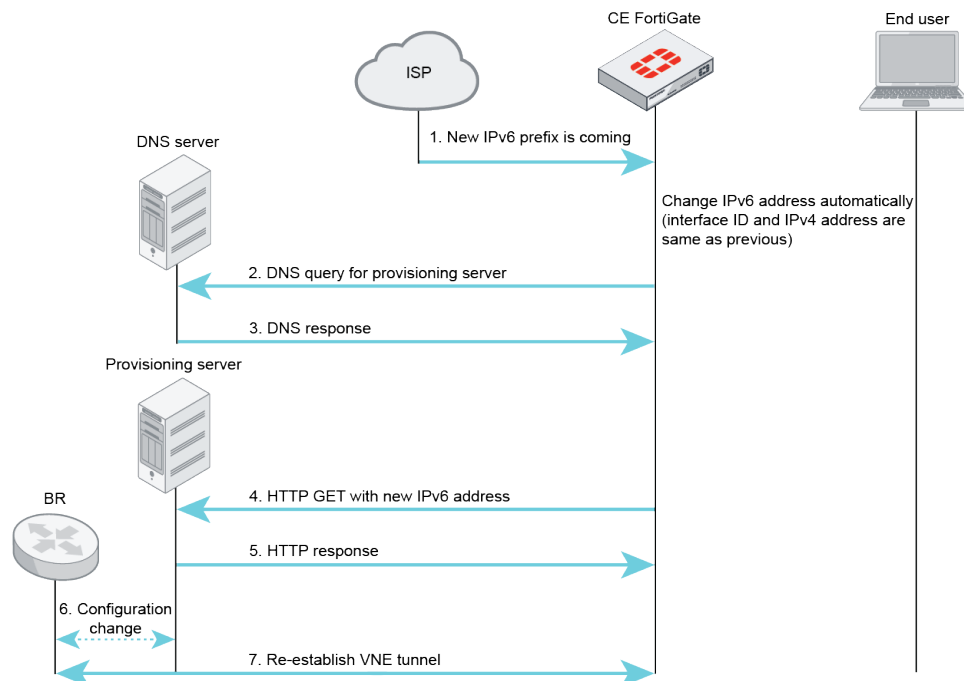

```
config system vne-tunnel
  set status enable
  set interface "wan1"
  set mode fixed-ip
  set ipv4-address 10.10.81.81 255.255.255.0
  set br 2001:160::82
  set update-url "http://qa.forosqa.com/update?user=xxxx&pass=yyyy"
end
```

Initial sequence overview of VNE tunnel under fixed IP mode:

Once the IPv6 address of the FortiGate changes, the tunnel will be down because the BR does not know the FortiGate's new IPv6 address. The FortiGate uses `update-url` to update the new IPv6 address to the provisioning server. The provisioning server updates the FortiGate's IPv6 address to the BR so the VNE tunnel can be re-established.

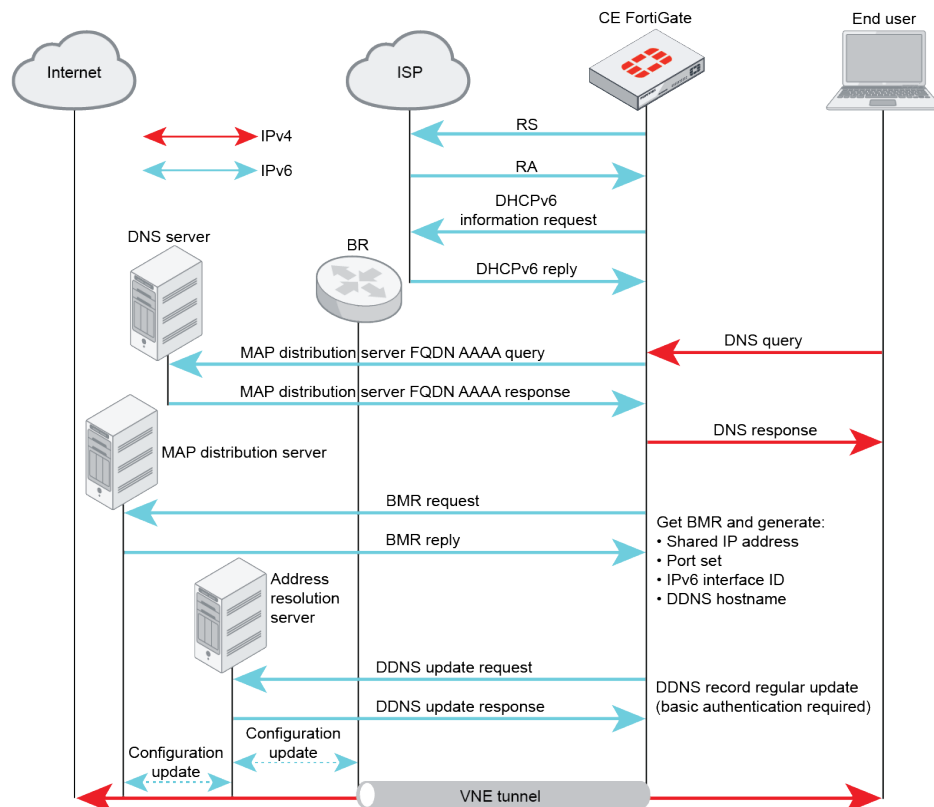

Communication sequence overview of re-establishing VNE tunnel:

2. Configure the VNE tunnel to use MAP-E mode:

```
config system vne-tunnel
    set status enable
    set interface 'wan1'
    set ssl-certificate "Fortinet_Factory"
    set bmr-hostname *****
    set auto-asic-offload enable
    set mode map-e
end
```

Initial sequence overview of VNE tunnel under MAP-E mode:

The FortiGate sends a MAP rule request to the MAP distribution server once the IPv6 address is configured on the FortiGate by RS/RA. Next, the FortiGate will send an AAAA query to get the IPv6 address of the MAP distribution server. After sending the BMR request to the MAP distribution server, the FortiGate will get the IPv4 address, port set, BR IPv6 address, and hostname of the address resolution server from the BMR reply. The VNE tunnel between the FortiGate and BR is now established.

The address resolution server is actually a dynamic DNS. The hostname is used for the FortiGate to maintain an IPv6 address when it changes.

The FortiGate updates the DDNS server with its IPv6 address whenever it updates, which in turn provides the update to the MAP distribution server and BR so they know how to resolve the FortiGate by hostname.

Once the VNE tunnel is established, a tunnel interface is created (`vne.root`), and an IPv4-over-IPv6 tunnel is set up between the FortiGate and BR. The route, firewall policy, and DNS server can now be configured to let the traffic go through the VNE tunnel and protect the end-user. The VNE tunnel can also be used in IPsec phase 1.

3. Configure the route:

```
config router static
  edit 1
    set device "vne.root"
  next
end
```

4. Configure the firewall policy:

```
config firewall policy
  edit 111
    set name "ff"
    set srcintf "port2"
    set dstintf "vne.root"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set av-profile "default"
    set nat enable
  next
end
```

5. Configure the DNS server:

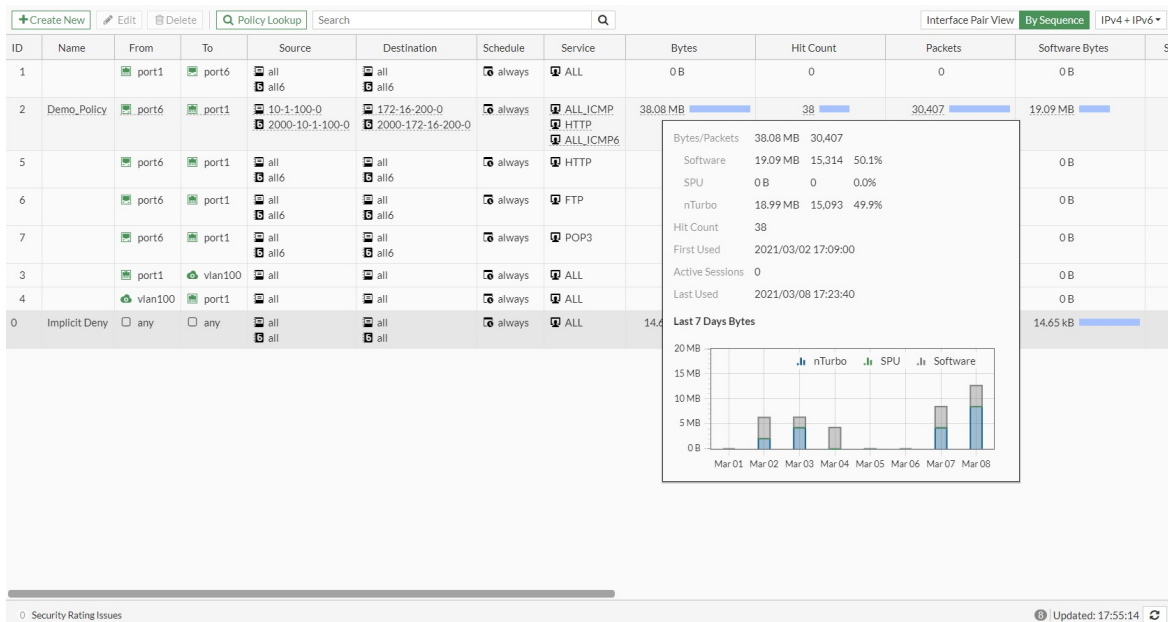

```
config system dns-server
  edit "port2"
  next
end
```

Seven-day rolling counter for policy hit counters

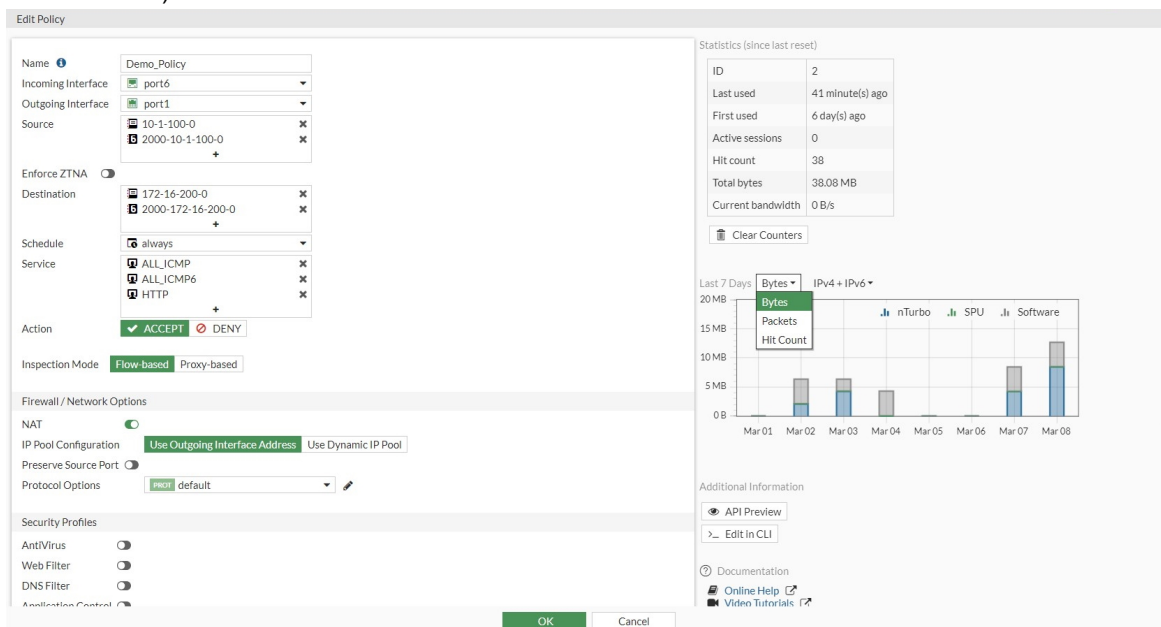

Instead of storing a single number for the hit count and byte count collected since the inception of each policy, seven numbers for the last seven days and an active counter for the current day are stored. The past seven-day hit count is displayed in the policy list and policy pages. A seven-day bar chart shows statistics on each policy page. This feature is currently supported in firewall and multicast policies, but not security policies.

To view the rolling counter information in the GUI:

1. Go to *Policy & Objects > Firewall Policy* or *Policy & Objects > Multicast Policy*.
2. Select a policy and hover over the *Bytes*, *Packets*, or *Hit Count* values to view the tooltip with the corresponding traffic statistics and bar graph (this example uses firewall policies).

- Click **Edit**. The policy traffic statistics appear in the right-hand side of the page.
- Use the dropdowns to filter the bar graph data by counter (*Bytes*, *Packets*, or *Hit Count*) and policy type (*IPv4*, *IPv6*, or *IPv4 + IPv6*).

- Optionally, click **Clear Counters** to delete the traffic statistics for the policy.
- Click **OK**.

To view the rolling counter information in the CLI:

```
# diagnose firewall iprope show 100004 2
idx=2 pkts/bytes=14709/18777329 asic_pkts/asic_bytes=8087/10413737 nturbo_pkts/nturbo_

```

Cisco Security Group Tag as policy matching criteria

The FortiGate can read the Cisco Security Group Tag (SGT) in Ethernet frames, and use them as matching criteria in firewall policies. A policy can match based on the presence of an SGT, or the detection of a specific ID or IDs.

When a packet with a SGT passes through and a session is established, the `ext_header_type=0xc5:0xc5` flag is included in the session table.

This feature is available in flow mode policies for virtual wire pair policies or policies in transparent mode VDOMs.

To configure a firewall policy to detect SGTs in Ethernet frames:

```

config firewall policy
  edit 1
    set sgt-check {enable | disable}
    set sgt <ID numbers>
  next
end

```

Examples

In these examples, wan1 and wan2 are in a virtual wire pair. Firewall policies are created that pass traffic with SGTs with a specific ID number, any ID number, or either of two specific ID numbers.

To configure the virtual wire pair:

```

config system virtual-wire-pair
  edit "test-vwp-1"
    set member "wan1" "wan2"
    set wildcard-vlan enable
  next
end

```

To configure a firewall policy to match frames that have an SGT with ID 20 and allow them through:

```
config firewall policy
  edit 1
    set srcintf "wan1"
    set dstintf "wan2"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set sgt-check enable
    set sgt 20
  next
end
```

To configure a firewall policy to match frames that have an SGT with any ID:

```
config firewall policy
  edit 1
    set srcintf "wan1"
    set dstintf "wan2"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set sgt-check enable
  next
end
```

To configure a firewall policy to match frames that have the SGT with IDs 20 or 21:

```
config firewall policy
  edit 1
    set srcintf "wan1"
    set dstintf "wan2"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set sgt-check enable
    set sgt 20 21
  next
end
```

Processing only Ethernet frames with a Cisco Security Group Tag

In this example, an Ethernet frame is sent from PC01 with an SGT tag (ID 20), which can pass through to PC05 based on any of the firewall policies in the previous examples.

To verify the configuration:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=10 expire=3593 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty br dst-vis f00
statistic(bytes/packets/allow_err): org=112/2/1 reply=60/1/1 tuples=2
tx speed(Bps/kbps): 10/0 rx speed(Bps/kbps): 5/0
origin->sink: org pre->post, reply pre->post dev=13->10/10->13 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=00:b0:e1:22:cf:e4
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=1
serial=0000183c tos=ff/ff app_list=0 app=0 url_cat=0

np_u_state=0x000001 no_offload
no_ofld_reason: disabled-by-policy
ext_header_type=0xc5:0xc5
total session 1
```

Processing Ethernet frames with a Cisco Security Group Tag and VLAN tag

The FortiGate has the ability to process Ethernet frames with both the Cisco Security Group Tag and VLAN tag.

In this example, PC02 is connected to a switch port configured for VLAN 2. An Ethernet frame is sent from PC02 with an SGT tag (ID 20) and VLAN ID (2), which can pass through to PC05 based on any of the firewall policies in the previous examples.

To verify the configuration:**1. Check the session list:**

```
# diagnose sys session list

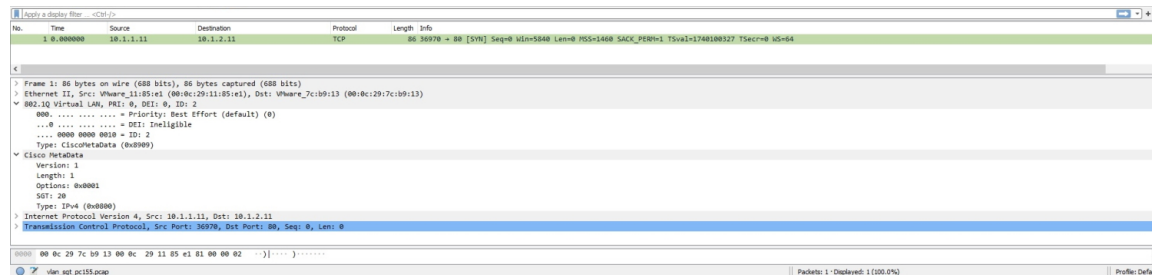

session info: proto=6 proto_state=01 duration=2007 expire=3482 timeout=3600
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=may_dirty br
statistic(bytes/packets/allow_err): org=164/3/1 reply=120/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
origin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 pol_uuid_idx=572 auth_info=0 chk_client_info=0 vd=0
serial=0432fb8f tos=ff/ff app_list=0 app=0 url_cat=0
```

```

npdb_link_id=00000000 ngfwid=n/a
vlanid=2
npu_state=0x4000001 no_offload
no_ofld_reason: disabled-by-policy
ext_header_type=0xc5:0xc5

```

2. Perform a packet capture on PC05 (Wireshark is used in this example) and check that the packet includes the VLAN ID and Cisco SGT fields.

Virtual patching on the local-in management interface

Virtual patching is a method of mitigating vulnerability exploits by using the FortiGate's IPS engine to block known vulnerabilities. Virtual patching can be applied to traffic destined to the FortiGate by applying IPS signatures to the local-in interface using local-in policies. Attacks geared towards GUI and SSH management access, for example, can be mitigated using IPS signatures pushed from FortiGuard, thereby virtually patching these vulnerabilities.

When the `virtual-patch` option is enabled in a local-in policy, the IPS engine queries the FortiGuard API server using the WAD process to obtain a list of vulnerabilities targeting the FortiGate on a particular version. IPS enables vulnerability rules to scan local-in traffic on the specified interface. All matched local-in traffic is dropped accordingly.

To configure virtual patching:

```

config firewall local-in-policy
    edit <id>
        set virtual-patch {enable | disable}
    next
end

```

The FortiGate must have a valid IPS license, and the extended IPS database must be enabled for more vulnerabilities to be covered in order to use the `virtual-patch` option.

To enable the extended database:

```

config ips global
    set database extended
end

```

Once `virtual-patch` is enabled, the WAD process will periodically query vulnerability items from the FortiGuard API server and forward it to IPS.

Sample vulnerability item found on the FortiGuard API server

```

{"vendor":"fortinet","min_version":"6.0.0","severity":"high","vuln_
type":"Permission/Privilege/Access Control","refs":["CVE-2018-
13382"],"ID":108824,"product":"fortios","patch_sig_id":0,"description":"An Improper

```

Authorization vulnerability in Fortinet FortiOS 6.0.0 to 6.0.4, 5.6.0 to 5.6.8 and 5.4.1 to 5.4.10 and FortiProxy 2.0.0, 1.2.0 to 1.2.8, 1.1.0 to 1.1.6, 1.0.0 to 1.0.7 under SSL VPN web portal allows an unauthenticated attacker to modify the password of an SSL VPN web portal user via specially crafted HTTP requests", "max_version": "6.0.4", "date_added": "2022-09-20 18:33:50.517577", "date_updated": "2022-09-20 18:33:50.517594"}

FortiGuard can be queried from the FortiOS CLI for a list of vulnerability rules while specifying parameters for the vendor, version, product, and model by running the `diagnose wad dev-vuln query` command. For example, to query Fortinet's FortiOS 7.0.3:

```
# diagnose wad dev-vuln query vendor=fortinet&version=7.0.3&product=fortios
FortiGate-201E # Dev-Vuln fetching is in process...
Dev-Vuln Lookup result: success, cache: miss, fgd: found, item: 0x7fbd2f09e138
Vulnerability details:
info entry (1):
    'vendor' = fortinet
    'product' = fortios
    'model' = N/A
    'version.min' = 7.0.0
    'version.max' = 7.0.3
    'firmware' = N/A
    'build' = N/A
    'date_added' = 2022-10-06 17:45:18.208424
    'date_updated' = 2022-10-06 17:45:18.208440
    'sig_id' = 0
    'vuln_id' = 146868
    'severity' = 2
...
```

After receiving the vulnerability rules from the WAD process, the IPS engine marks them as virtual patch rules mapped to each CVE vulnerability signature. For example:

FortiOS.NodeJS.Proxy.Authentication.Bypass(CVE-2022-40684)

FortiOS.SSL.VPN.Web.Portal.Password.Improper.Authentication(CVE-2018-13382)

FortiOS.SSL.VPN.Web.Protoal.Pathname.Information.Disclosure(CVE-2018-13379)

Example

In this example, the FortiGate's port2 is configured with virtual patching enabled. In the test scenario, the FortiGate is set to debug mode in order to block a harmless attack. IPS will scan local-in traffic and all matched local-in traffic will be dropped accordingly. Intrusion prevention logs will be recorded.

To configure virtual patching on the local-in management interface:**1. Configure the local-in policy:**

```
config firewall local-in-policy
  edit 1
    set intf "port2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set service "ALL"
    set schedule "always"
    set virtual-patch enable
  next
end
```

2. For testing purpose only, enable all signatures for the virtual patch feature:

```
# diagnose ips vpatch enable-all
```

3. From the Linux client, start a cURL download:

```
root@PC02:~# curl -vk -F "file=@eicar" https://10.1.100.175 -m 10
```

The attack is blocked, and a security event log (intrusion prevention) is recorded.

4. Reset the virtual patch enabled signatures back to the default:

```
# diagnose ips vpatch reset
```

Configuring PCP port mapping with SNAT and DNAT

FortiOS supports the Port Control Protocol (PCP) by allowing the FortiGate to act as a PCP server, and dynamically manage network addresses and port translations for PCP clients. The PCP server must be enabled with a pool (config system pcp-server). In the firewall policy, enable either pcp-outbound or pcp-inbound mode and assign the pool.

```
config system pcp-server
  set status {enable | disable}
  config pools
    edit <name>
      set client-subnet <ip_address/subnet>
      set ext-intf <string>
      set extip ip>[-<ip>]
      set extport <port>[-<port>]
      set minimal-lifetime <integer>
      set maximal-lifetime <integer>
      set client-mapping-limit <integer>
      set mapping-filter-limit <integer>
      set allow-opcode {map peer announce}
      set third-party {allow | disallow}
      set multicast-announcement {enable | disable}
      set announcement-count <integer>
      set intl-intf <string>
      set recycle-delay <integer>
    next
  end
end
```

<code>client-subnet <ip_address/subnet></code>	Enter the IP address with subnet from which PCP requests are accepted.
<code>ext-intf <string></code>	Enter the external interface name.
<code>extip <ip>[-<ip>]</code>	Enter the IP address or address range on the external interface to map to an address on the internal network.
<code>extport <port>[-<port>]</code>	Enter the incoming port number or port range to map to a port number on the internal network.
<code>minimal-lifetime <integer></code>	Set the minimal lifetime of a PCP mapping, in seconds (60 - 300, default = 120).
<code>maximal-lifetime <integer></code>	Set the maximal lifetime of a PCP mapping, in seconds (3600 - 604800, default = 86400).
<code>client-mapping-limit <integer></code>	Mapping limit per client (0 - 65535, default = 0, 0 = unlimited).
<code>mapping-filter-limit <integer></code>	Filter limit per mapping (0 - 5, default = 1).
<code>allow-opcode {map peer announce}</code>	Set the allowed PCP OpCode: <ul style="list-style-type: none"> map: allow MAP OpCode peer: allow PEER OpCode announce: allow ANNOUNCE OpCode
<code>third-party {allow disallow}</code>	Allow/disallow the third-party option.
<code>multicast-announcement {enable disable}</code>	Enable/disable multicast announcements.
<code>announcement-count <integer></code>	Set the number of multicast announcements (3 - 10, default = 3).
<code>intl-intf <string></code>	Enter the internal interface name.
<code>recycle-delay <integer></code>	Set the minimum delay the PCP server will wait before recycling mappings that have expired, in seconds (0 - 3600, default = 0).

The following topology is used to demonstrate two use cases of PCP mapping: with SNAT and DNAT.

Example 1: PCP mapping with SNAT

This example demonstrates how PCP mapping works with SNAT. In the FortiGate PCP server settings, the `pcp-pool1` pool is applied in the firewall policy with `pcp-outbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP outbound mapping. When traffic is sent from Client-1 to Client-2, SNAT is performed by the PCP outbound mapping.

To configure the FortiGate as a PCP server:**1. Configure the PCP server settings:**

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 999
        set name "Outbound-pcp-policy999"
        set srcintf "wan2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-outbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

```
root@pc41:~# pcp -i 10.1.100.41:41111 -p 172.16.200.55:80 -s 10.1.100.8
```

3. On the FortiGate, verify the PCP outbound mappings list:

```
# diagnose firewall pcp-mapping list outbound
PCP outbound mappings (vdom=root):
pool:1 nonce:04307eb4037e0448317dc8b7 protocol:6 duration:8 lifetime:900 expiry:893
intl:10.1.100.41:41111 ext:172.16.200.231:50000 remote:172.16.200.55:80
```

4. Send HTTP traffic that passes through the FortiGate and access Client-2 (172.16.200.55:80) from Client-1.
5. On the FortiGate, verify the session list. The source IP address of Client-1 is translated to 172.16.200.231:50000, which follows the PCP outbound mapping:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=8 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00 pcp_outbound
statistic(bytes/packets/allow_err): org=1812/33/1 reply=124168/92/1 tuples=2
tx speed(Bps/kbps): 204/1 rx speed(Bps/kbps): 13998/111
origin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.55/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.55:80 (172.16.200.231:50000)
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.231:50000 (10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b4f8 tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason: disabled-by-policy
total session 1
```

6. Send HTTP traffic that passes through the FortiGate and access another server from Client-1.
7. On the FortiGate, verify the session list. This time, the source IP address of Client-1 is not translated to 172.16.200.231:50000, since the traffic does not match the existing PCP outbound mapping:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=6 expire=3596 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1449/26/1 reply=98808/72/1 tuples=2
tx speed(Bps/kbps): 215/1 rx speed(Bps/kbps): 14703/117
origin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.155/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.155:80 (172.16.200.8:41111)
hook=pre dir=reply act=dnat 172.16.200.155:80->172.16.200.8:41111 (10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b596 tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason: disabled-by-policy
total session 1
```

Example 2: PCP mapping with DNAT

This example demonstrates how PCP mapping works with DNAT. In the FortiGate PCP server settings, the `pcp-pool1` pool is applied in the firewall policy with `pcp-inbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP inbound mapping. When traffic is sent from Client-2 to access the external IP of Client-1 (172.16.200.231:50000), traffic passes by due to the PCP inbound mapping.

To configure the FortiGate as a PCP server:**1. Configure the PCP server settings:**

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 998
        set name "Inbound-pcp-policy998"
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-inbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

```
root@pc41:~# pcp -i 10.1.100.41:80 -s 10.1.100.8
```

3. On the FortiGate, verify the PCP inbound mappings list:

```
# diagnose firewall pcp-mapping list inbound
PCP inbound mappings (vdom=root):
pool:1 nonce:35e2ff035b959f7a4e669791 protocol:6 duration:3 lifetime:900 expiry:900
intl:10.1.100.41:80 ext:172.16.200.231:50000
```

4. From Client-2 (172.16.200.55:80), send traffic that passes through the FortiGate and access the external IP of Client-1 (172.16.200.231:50000).
5. On the FortiGate, run a sniffer trace. The traffic is allowed through policy 998, and the destination IP:port is translated from 172.16.200.231:50000 to 10.1.100.41:80, which follows the PCP inbound mapping:

```
# diagnose sniffer packet any 'tcp and port 50000 or port 80' 4
interfaces=[any]
filters=[tcp and port 50000 or port 80]
2.959915 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: syn 3480016601
2.960051 wan2 out 10.1.100.8.43284 -> 10.1.100.41.80: syn 3480016601

```

Only traffic matching the PCP inbound mapping will be forwarded by policy 998. Any other traffic is dropped.

Address objects

Addresses define sources and destinations of network traffic and can be used in many functions such as firewall policies, ZTNA, etc.

To view the possible uses list of address object usage:

1. Go to *Policy & Objects > Addresses*.
2. Click the number under *Ref*. The *Usage of Address:<Predefined address>* pane opens, where *<Predefined address>* is one of the predefined addresses, such as *SSLVPN_TUNNEL_ADDR1*.
3. In the *Usage of Address:<Predefined address>* pane, click *Possible Uses* to view the list.

When properly set up, these address objects can be used with great flexibility to make the configuration of different functions simpler and more intuitive. When used in a firewall policy, the FortiGate compares the IP addresses contained in packet headers with a policy's source and destination addresses to determine if the policy matches the traffic. The matching of IP addresses in packet headers is also performed for other FortiGate functions configured with address objects.

Address Types

When creating an IPv4 address, there are several different types of addresses that can be specified. Which one is chosen will depend on which method most easily yet accurately describes the addresses that you are trying to include with as few entries as possible based on the information that you have. For instance, if you are trying to describe the addresses of a specific company's web server but do not know how extensive their web server farm is, you would be more likely to use a Fully Qualified Domain Name (FQDN) rather than a specific IP address. On the other hand, some computers do not have FQDNs and a specific IP address must be used.

The following table provides a short description of the different types of addresses:

Address type	Description
Subnet	<p>The subnet type of address is expressed using a host address and a subnet mask. This is the most flexible of the address types because the address can refer to as little as one individual address (x.x.x.x/32) or as many as all of the available addresses (0.0.0.0/0).</p> <p>See Subnet on page 1305 and Dynamic policy — Fabric devices on page 1306 for more information.</p>
IP range	<p>The IP range type can be used to define a continuous set of IP addresses between one specific IP address and another (inclusive). It is a flexible way to describe a continuous set of addresses while being specific and granular, without needing to fall within the boundaries of standard subnets.</p> <p>See IP range on page 1308 for more information.</p>
FQDN	<p>The Fully Qualified Domain Name (FQDN) address type accepts an address string and resolves it to one or more IP addresses. It relies on DNS to keep up with address changes without having to manually change the IP addresses on the FortiGate.</p> <p>See FQDN addresses on page 1308 for more information.</p> <p>FQDN can also be specified as wildcard addresses such as *.example.com. See Using wildcard FQDN addresses in firewall policies on page 1309 for more information.</p>
Geography	<p>Geography addresses are those determined by the country/region of origin. The IPs for the country/region is automatically determined from the Geography IP database.</p> <p>See Geography based addresses on page 1311 and IPv6 geography-based addresses on page 1314 for more information.</p>
Dynamic	<p>Dynamic address objects are collections of addresses that are integrated from different external sources or other modules within the FortiGate. They can be used in policies that support the dynamic address type and come in different subtypes.</p> <ul style="list-style-type: none"> • ClearPass: IP addresses gathered from the ClearPass Policy Manager. See ClearPass integration for dynamic address objects on page 1326 for more information. • Device & OS Identification: MAC addresses gathered from device detection that can be filtered by hardware vendor, model, OS, and OS version. See MAC addressed-based policies on page 1333 for more information.

Address type	Description
	<ul style="list-style-type: none"> Fabric Connector Address: IP addresses retrieved from SDN connectors, such as public and private cloud connectors. See Getting started with public and private SDN connectors on page 3017 for more information. FortiNAC Tag: IP addresses collected from FortiNAC. See FortiNAC tag dynamic address on page 1329 for more information. FortiVoice Tag: IP and MAC addresses collected from FortiVoice. See FortiVoice tag dynamic address NEW on page 1332 for more information. FortiPolicy Tag: IP addresses pushed from FortiPolicy. See Configuring FortiPolicy on page 2832 for more information. FortiVoice Tag: IP addresses collected from FortiVoice. Fortinet Single Sign-On (FSSO): IP addresses of authenticated users from a FSSO collector agent, CPPM by FortiManager, or FortiNAC. See FSSO dynamic address subtype on page 1322 for more information. Switch Controller NAC Policy Tag: MAC addresses collected from NAC policies.
Device (Mac address)	<p>A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. See MAC addressed-based policies on page 1333, Adding MAC-based addresses to devices on page 125, ISDB well-known MAC address list on page 1335, and IPv6 MAC addresses and usage in firewall policies on page 1337 for more information.</p>
Wildcard (CLI only)	<p>Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network.</p> <p>See Wildcard addressing on page 1316 for more information.</p>
Interface subnet (CLI only)	<p>For all interfaces set to a LAN or DMZ role, an option is available and enabled by default to automatically create an address object for the connected network. If the interface's subnet changes, the address object subnet changes too.</p> <p>See Interface subnet on page 1317 for more information.</p>

Address Group

Address groups are designed for ease of use in the administration of the device. If you have several addresses or address ranges that will commonly be treated the same or require the same security policies, you can put them into address groups, rather than entering multiple individual addresses in each policy that refers to them.

There are two different types of address groups and the following table provides a short description of each type:

Address group type	Description
Group	<p>Members of an address group type group can belong to multiple address groups. See Address group on page 1319, Allow empty address groups on page 1321, and Address group exclusions on page 1321 for more information.</p>

Address group type	Description
Folder	Members of an address group type folder can only belong to a single address folder. See Address folders on page 1319 for more information.

Subnet

A subnet address object is usually used to refer internal networks or addresses which are defined by the network administrator.

A subnet address usually consists of a network address and a netmask, for example, 192.168.1.0 255.255.255.0. In this example, the network address is 192.168.1.0 and the netmask is 255.255.255.0. The network address defines the network to match and the netmask specifies the IP address to match on the network.

In the above example, the subnet address 192.168.1.0 255.255.255.0 would match the following IP addresses:

```
192.168.1.1
192.168.1.2
192.168.1.3
...
192.168.1.255
```

For defining a subnet address object the valid format of IP address and netmask could be either:

`x.x.x.x/x.x.x.x`, such as 192.168.1.0/255.255.255.0

or

`x.x.x.x/x`, such as 192.168.1.0/24

To define a single address using subnet, use the netmask 255.255.255.255 or /32. A warning message will be shown if any other netmask is used and will not let the user save the address object.

To create a subnet address:

1. Go to *Policy & Objects > Addresses*.
2. Select *Create New > Address*.
3. In the *Category* field, select *Address*.
4. Enter a *Name* for the address object.
5. In the *Type* field, select *Subnet* from the dropdown menu.
6. In the *IP/Netmask* field, enter the address and subnet mask according to the format `x.x.x.x/x.x.x.x` or the short hand format of `x.x.x.x/x`
7. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
8. Enable/disable *Static route configuration*.
9. Enter any additional information in the *Comments* field.
10. Click *OK*.

Dynamic policy — Fabric devices

The dynamic address group represents the configured IP addresses of all Fortinet devices connected to the Security Fabric. It currently includes FortiManager, FortiAnalyzer, FortiClient EMS, FortiMail, FortiAP(s), and FortiSwitch(es). Like other dynamic address groups for fabric connectors, it can be used as an IPv4 address in firewall policies and objects.

The list of firewall addresses includes a default address object called `FABRIC_DEVICE`. You can apply the `FABRIC_DEVICE` object to the following types of policies:

- Firewall policy, including virtual wire pairs, NAT 46, and NAT 64 (IPv4 only)
- IPv4 shaping policy
- IPv4 ACL policy

You cannot apply the `FABRIC_DEVICE` object to the following types of policies:

- IPv4 explicit proxy policy

You also cannot use the `FABRIC_DEVICE` object with the following settings:

- Custom extension on `internet-service`
- Exclusion of `addrgrp`

Initially the `FABRIC_DEVICE` object does not have an address value. The address value is populated dynamically as things change. As a result, you cannot edit the `FABRIC_DEVICE` object, add any addresses to the object, or remove any addresses from the object. The *Edit Address* pane in the GUI only has a *Return* button because the object is read-only:

The screenshot shows the 'Edit Address' configuration page in the FortiGate GUI. The main configuration area on the left includes the following fields:

- Name:** FABRIC_DEVICE
- Color:** Change (button)
- Type:** Subnet (dropdown)
- IP/Netmask:** 0.0.0.0/0.0.0.0
- Interface:** any (dropdown)
- Static route configuration:** Disabled (toggle)
- Comments:** IPv4 addresses of Fabric Devices. (33/255 characters)

The right sidebar contains the following sections:

- FortiGate** logo and **FGDocs** link.
- Additional Information:**
 - API Preview (eye icon)
 - References (link icon)
 - Edit in CLI (button)
- Dynamic Address** section with a list of guides:
 - Configuring an AWS Dynamic Address
 - Configuring an Azure Dynamic Address
 - Configuring a Google Cloud Platform Dynamic Address
 - Configuring an Oracle Cloud Infrastructure Dynamic Address
 - Configuring an OpenStack Dynamic Address
- Documentation** section with links to Online Help and Video Tutorials.

A **Return** button is located at the bottom center of the page.

The `FABRIC_DEVICE` object address values are populated based on:

- FortiAnalyzer IP (from the *Fabric Settings* pane)
- FortiManager IP (from the *Fabric Settings* pane)
- FortiMail IP (from the *Fabric Settings* pane)
- FortiClient EMS IP (from the *Fabric Settings* pane)
- FortiAP IPs (from the *FortiAP Setup* pane or DHCP)
- FortiSwitch IPs (from the *FortiSwitch Setup* page or DHCP)

To apply the FABRIC_DEVICE object to a firewall policy using the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a new policy or edit an existing policy.
3. For the *Destination* field, select *FABRIC_DEVICE* from the list of address entries.
4. Configure the rest of the policy as needed.
5. Click *OK*.

To apply the FABRIC_DEVICE object to a firewall policy using the CLI:

```
config firewall address
  edit "FABRIC_DEVICE"
    set type ipmask
    set comment "IPv4 addresses of Fabric Devices."
    set visibility enable
    set associated-interface ''
    set color 0
    set allow-routing disable
    set subnet 0.0.0.0 0.0.0.0
  next
end

config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "FABRIC_DEVICE"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set fsso disable
    set nat enable
  next
end
```

Diagnose command

You can use the diagnose command to list IP addresses of Fortinet devices that are configured in the Security Fabric.

To run the diagnose command using the CLI:

```
(root) # diagnose firewall sf-addresses list
```

```
FabricDevices: 172.18.64.48
FortiAnalyzer: 172.18.60.25
FortiSandbox: 172.18.52.154
FortiManager: 172.18.28.31
FortiClientEMS: 172.18.62.6
FortiAP:
FortiSwitch:
FortiAP/SW-DHCP:
```

IP range

The IP range type of address can describe a group of addresses while being specific and granular. It does this by specifying a continuous set of IP addresses between one specific IP address and another.

The format would be:

x.x.x.x-x.x.x.x, such as 192.168.110.100-192.168.110.120

To create an IP range address:

1. Go to *Policy & Objects > Addresses*.
2. Select *Create New > Address*.
3. In the *Category* field, select *Address*.
4. Enter a *Name* for the address object.
5. In the *Type* field, select *IP Range* from the dropdown menu.
6. In the *IP Range* field, enter the range of addresses in the following format: x.x.x.x-x.x.x.x (no spaces)
7. In the *Interface* field, leave as the default any or select a specific interface from the drop down menu.
8. Enable/disable *Static route configuration*.
9. Enter any additional information in the *Comments* field.
10. Click *OK*.

FQDN addresses

By using Fully Qualified Domain Name (FQDN) addressing you can take advantage of the dynamic ability of DNS to keep up with address changes without having to manually change the addresses on the FortiGate. FQDN addresses are most often used with external web sites but they can be used for internal web sites as well if there is a trusted DNS server that can be accessed. FQDN addressing also comes in handy for large web sites that may use multiple addresses and load balancers for their web sites. The FortiGate firewall automatically maintains a cached record of all the addresses resolved by the DNS for the FQDN addresses used.

For example, if you were doing this manually and you wanted to have a security policy that involved Google, you could track down all of the IP addresses that they use across multiple countries. Using the FQDN address is simpler and more convenient.

When representing hosts by an FQDN, the domain name can also be a subdomain, such as mail.example.com.

Valid FQDN formats include:

- <host_name>.<top_level_domain_name>, such as example.com
- <host_name>.<second_level_domain_name>.<top_level_domain_name>, such as mail.example.com.

The FortiGate firewall keeps track of the DNS TTLs so as the entries change on the DNS servers the IP address will effectively be updated for the FortiGate. As long as the FQDN address is used in a security policy, it stores the address in the DNS cache.

There is a possible security downside to using FQDN addresses. Using a fully qualified domain name in a security policy means that your policies are relying on the DNS server to be accurate and correct. Should the DNS server be compromised, security policies requiring domain name resolution may no longer function properly.

To create a Fully Qualified Domain Name address:

1. Go to *Policy & Objects > Addresses*.
2. Select *Create New > Address*.
3. In the *Category* field, choose *Address*.
4. Enter a *Name* for the address object.
5. In the *Type* field, select *FQDN* from the dropdown menu.
6. Enter the domain name in the *FQDN* field.
7. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
8. Enable/disable *Static route configuration*.
9. Enter any additional information in the *Comments* field.
10. Click *OK*.

Using wildcard FQDN addresses in firewall policies

You can use wildcard FQDN addresses in firewall policies. IPv4, IPv6, ACL, local, shaping, NAT64, NAT46, and NGFW policy types support wildcard FQDN addresses.

For wildcard FQDN addresses to work, the FortiGate should allow DNS traffic to pass through.

Initially, the wildcard FQDN object is empty and contains no addresses. When the client tries to resolve a FQDN address, the FortiGate will analyze the DNS response. The IP address(es) contained in the answer section of the DNS response will be added to the corresponding wildcard FQDN object. It is therefore necessary to have the DNS session-helpers defined in the `config system session-helper` setting.

Since FortiGate must analyze the DNS response, it does not work with DNS over HTTPS.

In FortiOS 7.0 and later, FortiGate supports DNS over TLS. It is possible to analyze DNS responses sent over DoT, as long as there is a firewall policy that allows the DNS traffic from the client and is configured with a DNS filter that supports DoT. For information on configuring this, see [DNS inspection with DoT and DoH on page 1552](#).

When the wildcard FQDN gets the resolved IP addresses, FortiOS loads the addresses into the firewall policy for traffic matching.

The FortiGate will keep the IP addresses in the FQDN object table as long as the DNS entry itself has not expired. Once it expires, the IP address is removed from the wildcard FQDN object until another query is made. At any given time, a single wildcard FQDN object may have up to 1000 IP addresses.

The DNS expiry TTL value is set by the authoritative name server for that DNS record. If the TTL for a specific DNS record is very short and you would like to cache the IP address longer, then you can extend it with the CLI. See [To extend the TTL for a DNS record in the CLI: on page 1311](#)

Wildcard FQDN IPs are synchronized to other autoscale members whenever a peer learns of a wildcard FQDN address.

To create a wildcard FQDN using the GUI:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Specify a *Name*.
3. For *Type*, select *FQDN*.
4. For *FQDN*, enter a wildcard FQDN address, for example, `*.fortinet.com`.

5. Click **OK**.

To use a wildcard FQDN in a firewall policy using the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. For *Destination*, select the wildcard FQDN.
3. Configure the rest of the policy as needed.
4. Click **OK**.

To create a wildcard FQDN using the CLI:

```
config firewall address
  edit "test-wildcardfqdn-1"
    set type fqdn
    set fqdn "*.fortinet.com"
  next
end
```

To use wildcard FQDN in a firewall policy using the CLI:

```
config firewall policy
  edit 2
    set srcintf "port3"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "test-wildcardfqdn-1"
    set action accept
    set schedule "always"
    set service "ALL"
    set auto-asic-offload disable
    set nat enable
```

```
    next
end
```

To use the diagnose command to list resolved IP addresses of wildcard FQDN objects:

```
# diagnose firewall fqdn list

List all FQDN:

*.fortinet.com: ID(48) ADDR(96.45.36.159) ADDR(192.168.100.161) ADDR(65.39.139.161)
```

Alternatively:

```
# diagnose test application dnsproxy 6

worker idx: 0

vfid=0 name=*.fortinet.com ver=IPv4 min_ttl=3266:0, cache_ttl=0 , slot=-1, num=3,
wildcard=1

    96.45.36.159 (ttl=68862:68311:68311) 192.168.100.161 (ttl=3600:3146:3146)
65.39.139.161
(ttl=3600:3481:3481)
```

To use the diagnose command for firewall policies which use wildcard FQDN:

```
# diagnose firewall iprule list 100004
...
destination fqdn or dynamic address (1):*.fortinet.com ID(48) uuid_idx=57 ADDR
(208.91.114.104) ADDR(208.91.114.142) ADDR(173.243.137.143) ADDR(65.104.9.196) ADDR
(96.45.36.210)
...
```

To extend the TTL for a DNS record in the CLI:

The TTL for DNS records can be configured globally, or for a specific FQDN address. If it is configured for an FQDN address, that setting will supersede the global setting for that address. See [Important DNS CLI commands on page 269](#) for information about configuring a global TTL.

In this the example the `set cache-ttl` value has been extended to 3600 seconds.

```
config firewall address
    edit "fortinet.com"
        set type fqdn
        set fqdn "www.fortinet.com"
        set cache-ttl 3600
    next
end
```

Geography based addresses

Geography addresses are those determined by country of origin. The IP for the country or region is automatically determined from the Geography IP database.

To view IP Geography database:

```
#diagnose autoupdate versions | grep -A 6 "IP Geography DB"
IP Geography DB
-----
Version: 3.00152
Contract Expiry Date: n/a
Last Updated using manual update on Thu Nov 17 17:52:00 2022
Last Update Attempt: Wed Nov 23 10:56:46 2022
Result: No Updates
```

Without a valid license, local IP geography database will continue to work. However the FortiGate will stop receiving geography IP updates from the FortiGuard servers and the geography IP database will no longer be updated. IP geolocation service is part of base services included with all FortiCare support contracts. See [FortiGuard Security Services](#) for more information.

To create a geography address:

1. Go to *Policy & Objects > Addresses*.
2. Select *Create New > Address*.
3. In the *Category* field, choose *Address*.
4. Enter a *Name* for the address object.
5. In the *Type* field, select *Geography* from the dropdown menu.
6. In the *Country/Region* field, select a single country from the dropdown menu.
7. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Overrides

It is possible to assign a specific IP address range to a customized country ID. Generally, geographic addressing is done at the VDOM level; it could be considered global if you are using the root VDOM, but the `geoip-override` setting is a global setting.

To configure a geography IP override:

1. Assign a specific IP address range to a customized country ID:

```
config system geoip-override
  edit "MyCustomCountry"
    config ip-range
      edit 1
        set start-ip 1.1.1.1
        set end-ip 1.1.1.2
      next
    end
  next
end
```

2. Use `get sys geoip-country XX` to determine the name corresponding to the custom 2-digit country code A0:

```
# get sys geoip-country A0
id                : A0
name              : MyCustomCountry
```

3. Show the full configuration of the geography IP override just created to show that it corresponds to country code A0:

```
# show full sys geoip-override
config system geoip-override
  edit "MyCustomCountry"
    set description ''
    set country-id "A0"
    config ip-range
      edit 1
        set start-ip 1.1.1.1
        set end-ip 1.1.1.2
      next
    end
  next
end
```

To configure a geography address:

1. Enable debug to display the CLI commands running on the backend in response to certain GUI configuration:

```
# diagnose debug enable
# diagnose debug cli 7
Debug messages will be on for 30 minutes.
```

2. Go to **Policy & Objects > Addresses** and create a geography address using the previously created custom country code:

3. Observe the corresponding CLI commands run on the backend:

```
FGT # 0: config firewall address
0: edit "TestGeoAddress"
0: set type geography
0: set country "A0"
0: end
```

Diagnose commands

There are a few diagnose commands used with geographic addresses:

```
diagnose firewall ipgeo [country-list | ip-list | ip2country | override | copyright-notice]
```

Diagnose command	Description
country-list	List of all countries.
ip-list	List of the IP addresses associated with the country.
ip2country	Used to determine which country a specific IP address is assigned to.
override	List of user defined geography data; items configured with the <code>config system geoip-override</code> command.
copyright-notice	Shows the copyright notice.

```
diagnose geoip [geoip-query | ip2country | iprange]
```

Diagnose command	Description
geoip-query	Used to determine the complete geolocation of a specific IP address from the FortiGuard IP Geography DB.
ip2country	Used to determine the physical and registered locations of the IP address as well and if the type is anycast.
lprange	List the IP addresses or IP ranges associated with the country.

For more details and examples using these diagnose commands, see the Fortinet Community article [Technical Tip: Commands to verify GeoIP information and troubleshoot GeoIP database](#).

IPv6 geography-based addresses

Geography-based IPv6 addresses can be created and applied to IPv6 firewall policies.

IPv6 geography-based addresses do not support `geoip-override` or `geoip-anycast`.

To create an IPv6 geography-based address in the GUI:

1. Go to *Policy and Objects > Addresses*.
2. Click *Create New > Address*.
3. Set *Category* to *IPv6 Address*.
4. Enter a name for the address.
5. Set *Type* to *IPv6 Geography*.
6. Select the *Country/Region* from the list.

7. Optionally, enter comments.

New Address

Category: Address **IPv6 Address**

Name: test-ipv6-geoip

Color: ■ Change

Type: IPv6 Geography

Country/Region: ■ Canada

Comments: IPv6 Geography address 22/255

8. Click OK.

To use the IPv6 geography address in a policy:

- Go to **Policy & Objects > Firewall Policy**.
- Edit an existing policy, or create a new one, using the IPv6 geography address as the **Source** or **Destination Address**.

New Policy

ID: 0

Name: test-policy6-1

Incoming Interface: wan2 (port6)

Outgoing Interface: wan1 (port5)

Source: all

Negate Source: ☐

Destination: test-ipv6-geoip

Negate Destination: ☐

Schedule: always

Service: ALL

Action: ☒ ACCEPT ☐ DENY

Inspection Mode: Flow-based Proxy-based

3. In the policy list, hover over the address to view details.

Name	From	To	Source	Destination	Action
DMZ to WAN	port2	wan1 (port5)	all	all	ACC
Internet Service in Policy	wan2 (port6)	wan1 (port5)	all	Google	ACC
LB-policy	wan1 (port5)	port2	all	Vserver	ACC
test-policy6-1	wan2 (port6)	wan1 (port5)	all	test-ipv6-geoip	ACC
Implicit Deny	any	any	all	all	DEN

IPv6 Address: test-ipv6-geoip

Type: IPv6 Geography

Country/Region: Canada

Comments: IPv6 Geography address

References: 1

Edit

100% 10 Updated: 16:34:58

To configure an IPv6 geography-based address in the CLI:**1. Create an IPv6 geography-based address:**

```
config firewall address6
  edit "test-ipv6-geoip"
    set type geography
    set color 6
    set comment "IPv6 Geography address"
    set country "CA"
  next
end
```

2. Use the IPv6 geography-based address in a policy:

```
config firewall policy
  edit 1
    set name "test-policy6-1"
    set srcintf "port6"
    set dstintf "port5"
    set srcaddr6 "all"
    set dstaddr6 "test-ipv6-geoip"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

Wildcard addressing

Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. Wildcard addresses are an advanced feature, usually required only for complex networks with complex firewall filtering requirements. By using these wildcard addresses in the firewall configuration, administrators can eliminate creating multiple, separate IP based address objects and then grouping them to then apply to multiple security policies.

A wildcard address consists of an IP address and a wildcard netmask, for example, 192.168.0.56 255.255.0.255. In this example, the IP address is 192.168.0.56 and the wildcard netmask is 255.255.0.255. The IP address defines the networks to match and the wildcard netmask defines the specific addresses to match on these networks.

In a wildcard netmask, zero denotes ignoring the value of the octet in the IP address. This means the wildcard firewall address matches any number in this address octet. This also means that the number included in this octet of IP address is ignored and can be any number. Usually, if the octet in the wildcard netmask is zero, the corresponding octet in the IP address is also zero.

In a wildcard netmask, a number denotes matching addresses according to how the numbers translate into binary addresses. For example, the wildcard netmask is 255; the wildcard address will only match addresses with the value for this octet that is in the IP address part of the wildcard address. So, if the first octet of the IP address is 192 and the first octet of the wildcard netmask is 255, the wildcard address will only match addresses with 192 in the first octet.

In the above example, the wildcard address 192.168.0.56 255.255.0.255 would match the following IP addresses:

```
192.168.0.56
192.168.1.56
192.168.2.56
```

```
...  
192.168.255.56
```

The wildcard addresses 192.168.0.56 255.255.0.255 and 192.168.1.56 255.255.0.255 define the same thing since the 0 in the wildcard mask means to match any address in the third octet.

The following is an example of how to configure a wildcard firewall address.

```
config firewall address  
  edit example_wildcard_address  
    set type wildcard  
    set wildcard 192.168.0.56 255.255.0.255  
  next  
end
```

Wildcard firewall addresses are initially configured in the CLI. You cannot choose wildcard in the GUI when creating the address, but after the address is created in the CLI, it will show up in the GUI. The *Type* field shows a grayed-out value of *Wildcard* and the settings, other than the *Type*, can be edited.

Interface subnet

Interface subnet address type enables an address object to be created automatically for the interface with which it is associated. Once created, the address object is updated when the interface IP/netmask changes on the associated interface.

To create the interface subnet address type object, create or edit an interface under *Network > Interfaces*, and enable the *Create address object matching subnet* option.

The *Create address object matching subnet* option is automatically enabled and displayed in the GUI when *Role* is set to *LAN* or *DMZ*.

When you disable the *Create address object matching subnet* option, the feature is disabled, and the associated firewall address is deleted.

To create an interface subnet:

1. Go to *Network > Interfaces*.
2. Select *Create New > Interface* or select existing interface and *Edit*.
3. Set *Role* to either *LAN* or *DMZ*.
4. Verify that *Create address object matching subnet* is available and automatically enabled.

5. Click OK.

The following is an example of how to configure an interface subnet firewall address on the CLI:

```
config firewall address
  edit "port1 address"
    set type interface-subnet
    set interface "port1"
  next
end
```

Interface subnet addresses are automatically created when *Role* is set to *LAN* or *DMZ* in the *Interface* page, or you can manually configure interface subnet addresses in the CLI. You cannot choose *Interface Subnet* in the GUI when creating the address, but after the address is created, *Interface Subnet* displays in the GUI. However, all the settings are grayed out, except *Name* and *Comments*, which can be edited.

When *Role* is set to *LAN* or *DMZ* in the *Interface* page, the new address object displays on the *Policy & Objects > Address > Interface Subnet* page.

Interface Subnet				
port1 address	172.16.200.0/24	port1	Address	0

After the address is created, the subnet is dynamically assigned to the address object, which can be seen in both GUI and CLI. If the interface address changes, the subnet will update dynamically.

```
config firewall address
  edit "port1 address"
    set type interface-subnet
    set subnet 172.16.200.0 255.255.255.0
    set interface "port1"
  next
end
```

Address group

The use of groups is not mandatory. However, adding individual addresses to a policy sometimes becomes tedious. If you use several different addresses with a given policy, these address objects can be grouped into an address group as it is much easier to add or subtract addresses from the group.

Security policies require addresses with homogenous network interfaces. Therefore, address groups should contain only addresses bound to the same network interface or Any.

For example, if address 1.1.1.1 is associated with port1, and address 2.2.2.2 is associated with port2, they cannot be in the same group. However, if 1.1.1.1 and 2.2.2.2 are configured with an interface of Any, they can be grouped, even if the addresses involve different networks.

To create an address group:

1. Go to *Policy & Objects > Addresses*.
2. Go to *Create New > Address Group*.
3. In the *Category* field, select *IPv4 Group*.
4. Enter a *Group name* for the address object.
5. In the *Type* field, select *Group*.
6. Select the + in the *Members* field. The *Select Entries* pane opens.
7. Select members of the group. It is possible to select more than one entry. Select the x icon in the field to remove an entry.
8. Enable/disable *Static route configuration*.
9. Enter any additional information in the *Comments* field.
10. Click *OK*.

Address folders

Some address objects logically belong to the same device, such as two IPs from the same computer. These address objects can be grouped into an address folder, which is an exclusive list of address objects that do not appear in other address groups or folders.

In the CLI, the folder type can be set after the member list is already populated. If the member list contains an incompatible entry, then the setting will be discarded when the *next/end* command is issued. If the folder type is set before the member list is populated, then the possible member entry list will be filtered according to the selected type.

To create an address folder in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address Group* and enter a name.

3. For *Type*, select *Folder*.
4. For *Members*, click the + to add the addresses. Address folders and groups are exclusive, so the *Select Entries* window filters out address objects that are a member of an existing group or folder.

5. Click *OK*.
6. In the address table, expand the *Address Group* section to view the folder (*dev1-addr-comb*). The expandable folder view shows the address folder's child objects:

	safe-network1-devices	Address Group (Folder)	2 entries		0
	dev1-addr-comb	Address Group (Folder)	3 entries		1
	dev1-IP-nic1	Subnet	192.168.1.25/32		1
	dev1-IP-nic2	Subnet	192.168.1.22/32		1
	dev1-mac	Device (MAC Address)	00:0a:95:9d:68:16		1
	dev2-addr-comb	Address Group (Folder)	4 entries		1
	dev2-IP-nic1	Subnet	192.168.1.101/32		1
	dev2-IP-nic2	Subnet	192.168.1.102/32		1
	dev2-IP-nic3	Subnet	192.168.1.103/32		1
	dev2-mac	Device (MAC Address)	11:5b:12:2c:87:02		1

To configure an address folder in the CLI:

```

config firewall addrgrp
    edit "safe-network1-devices"
        set type folder
        set member "dev1-addr-comb" "dev2-addr-comb"
        set comment ''
        set exclude disable
        set color 13
    next
end

config firewall addrgrp
    edit "dev1-addr-comb"
        set type folder
        set member "dev1-IP-nic1" "dev1-IP-nic2" "dev1-mac"
        set comment ''
        set exclude disable
        set color 18
    next
end

```

```

config firewall addrgrp
  edit "dev2-addr-comb"
    set type folder
    set member "dev2-IP-nic1" "dev2-IP-nic2" "dev2-IP-nic3" "dev2-mac"
    set comment ''
    set exclude disable
    set color 5
  next
end

```

Allow empty address groups

Address groups with no members can be configured in the GUI, CLI, and through the API. In previous versions of FortiOS, error messages appear for empty address groups and they cannot be configured.

To create an empty address group in the GUI:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address Group*.
2. Enter a name.

3. Click *OK*. The *This field is required.* error is not displayed under the *Members* field.

To create an empty address group in the CLI:

```

config firewall addrgrp
  edit "test-empty-addrgrp4-1"
  next
end

```

No error message is returned in the console.

Address group exclusions

Specific IP addresses or ranges can be subtracted from the address group with the *Exclude Members* setting in IPv4 address groups.

This feature is only supported for IPv4 address groups, and only for addresses with a *Type* of *IP Range* or *Subnet*.

To exclude addresses from an address group using the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Create a new address group, or edit an existing address group.
3. Enable *Exclude Members* and click the + to add entries.
4. Configure the other settings as needed.
5. Click **OK**.

The excluded members are listed in the *Exclude Members* column.

To exclude addresses from an address group using the CLI:

```
config firewall addrgrp
  edit <address group>
    set exclude enable
    set exclude-member <address> <address> ... <address>
  next
end
```

FSSO dynamic address subtype

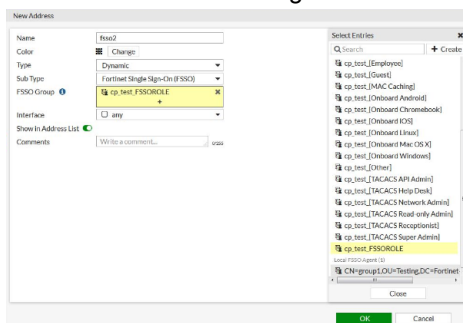

The Fortinet Single Sign-ON (FSSO) dynamic firewall address subtype can be used in policies that support dynamic address types. The FortiGate will update the dynamic address used in firewall policies based on the source IP information for the authenticated FSSO users.

It can also be used with FSSO group information that is forwarded by ClearPass Policy Manager (CPPM) via FortiManager, and other FSSO groups provided by the FSSO collector agent or FortiNAC. Up to 3000 dynamic FSSO IP addresses are supported per dynamic FSSO group.

To configure FSSO dynamic addresses with CPPM and FortiManager in the GUI:

1. Create the dynamic address object:

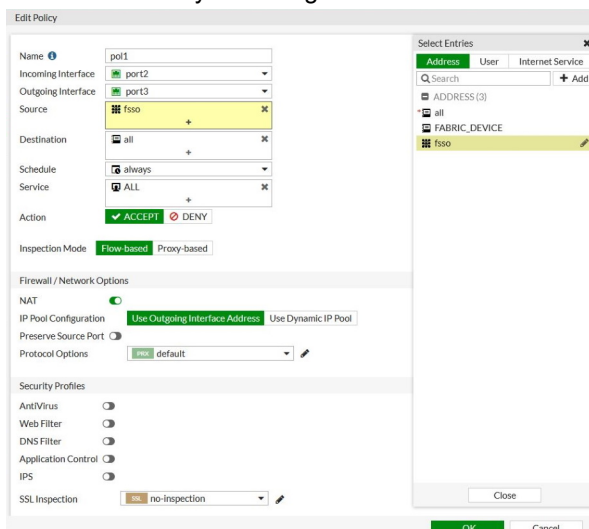

- Go to *Policy & Objects > Addresses*, and click *Create New > Address*.
- For *Type*, select *Dynamic*.
- For *Sub Type*, select *Fortinet Single Sign-On (FSSO)*. The *Select Entries* pane opens and displays all available FSSO groups.
- Select one or more groups.
- Click *OK* to save the configuration.

In the address table, there will be an error message for the address you just created (*Unresolved dynamic address: fssoc*). This is expected because there are currently no authenticated FSSO users (based on source IP) in the local FSSO user list.

2. Add the dynamic address object to a firewall policy:

- Go to *Policy & Objects > Firewall Policy*.
- Create a new policy or edit an existing policy.
- For *Source*, add the dynamic FSSO address object you just created.
- Configure the rest of the policy as needed.
- Click *OK* to save your changes.

3. Test the authentication to add a source IP address to the FSSO user list:

- Log in as user and use CPPM for user authentication to connect to an external web server. After successful authentication, CPPM forwards the user name, source IP address, and group membership to the FortiGate via FortiManager.

- b. Go to **Monitor > Firewall User Monitor** to view the user name (*fsso1*) and IP address.

Refresh	Deauthenticate	Show all FSSO Logons	Search	
User Name	User Group	Duration	IP Address	Traffic Volume
fsso1	FSSO-CPPM cp_test_FSSOROLE	44 minute(s) and 36 second(s)	10.1.100.185	0 B
Fortinet Single Sign-On				

- c. Go to **Policy & Objects > Addresses** to view the updated address table. The error message no longer appears.
- d. Hover over the dynamic FSSO address to view the IP address (*fsso resolves to: 10.1.100.185*).

Create New	Edit	Clone	Delete	Search	
Name	Type	Details	Interface	Visibility	Ref.
FABRIC_DEVICE	Subnet	0.0.0.0/0		Visible	0
FIREWALL_AUTH_PORTAL_ADDRESS	Subnet	0.0.0.0/0		Hidden	0
SS	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.root)	Visible	0
all	Subnet	0.0.0.0/0		Visible	1
fsso	Dynamic (FSSO)	cp_test_FSSOROLE		Visible	1

To verify user traffic in the GUI:

1. Go to **Log & Report > Forward Traffic**.

Details for the user *fsso1* are visible in the traffic log:

Date/Time	Source	Device	Destination	Application	Log Details
2019/08/29 11:23:06	fsso1 (10.1.100.185)		13.56.33.144 (ec2-13-56-33-144-us-west-1.compute.amazonaws.com)		General Date: 2019/08/29 Time: 11:22:42 Duration: 2s Session ID: 1360230 Virtual Domain: root NAT Translation: Source

2019/08/28 14:14:06	fsso2 (10.1.100.188)		104.80.88.122 (a104-80-88-122.deploy.static.akamaitechnologies.com)		
2019/08/28 14:14:00	fsso2 (10.1.100.188)		104.80.88.122 (a104-80-88-122.deploy.static.akamaitechnologies.com)		
2019/08/28 14:12:56	fsso2 (10.1.100.188)		72.21.81.200		
2019/08/28 14:12:56	fsso2 (10.1.100.188)		72.21.81.200		
2019/08/28 14:12:44	fsso2 (10.1.100.188)		151.139.128.14		
2019/08/28 14:12:38	fsso2 (10.1.100.188)		151.139.128.14		
2019/08/28 13:32:02	fsso2 (10.1.100.188)		20.189.79.72		
2019/08/28 12:32:02	fsso2 (10.1.100.188)		20.189.79.72		
2019/08/28 12:24:53	fsso2 (10.1.100.188)		173.243.138.100		
2019/08/28 12:24:49	fsso2 (10.1.100.188)		173.243.138.100		

- If another user is authenticated by CPPM, then the dynamic address *fsso* entry in the address table will be updated. The IP address for user *fsso2* (*10.1.100.188*) is now visible:

Create New	Edit	Clone	Delete	Search	
Name	Type	Details	Interface	Visibility	Ref.
FABRIC_DEVICE	Subnet	0.0.0.0/0		Visible	0
FIREWALL_AUTH_PORTAL_ADDRESS	Subnet	0.0.0.0/0		Hidden	0
SS	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.root)	Visible	0
all	Subnet	0.0.0.0/0		Visible	1
fsso	Dynamic (FSSO)	cp_test_FSSOROLE		Visible	1

2. Go to **FortiView > Sources** to verify that the users were able to successfully pass the firewall policy.

Source	Device	Bytes	Sessions	Bandwidth
fsso2 10.1.100.188		12.07 MB	173	10.32 Mbps
fsso1 10.1.100.185		4.42 MB	148	5.62 Mbps

If a user logs off and CPPM receives log off confirmation, then CPPS updates the FortiGate FSSO user list via FortiManager. The user IP address is deleted from the dynamic FSSO address, and the user is no longer be able to pass the firewall policy.

To configure FSSO dynamic addresses with CPPM and FortiManager in the CLI:**1. Create the dynamic address object:**

```
config firewall address
  edit "fsso"
    set type dynamic
    set sub-type fsso
    set fsso-group "cp_test_FSSOROLE"
  next
end
```

2. Add the dynamic address object to a policy:

```
config firewall policy
  edit 1
    set name "pol1"
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "fsso"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set fsso disable
    set nat enable
  next
end
```

To verify user traffic in the CLI:**1. Check the FSSO user list:**

```
diagnose debug authd fsso list
----FSSO logons----

```

ClearPass integration for dynamic address objects

ClearPass Policy Manager (CPPM) can gather information about the statuses of network hosts, for example, the latest patches or virus infections. Based on this information, CPPM send the IP addresses and current states, such as Healthy or Infected, to the FortiGate.

On the FortiGate, the IP addresses received from CPPM are added to a dynamic firewall address with the *clearpass-spt* subtype. This address can be used in any policy that supports dynamic addresses, such as Firewall or SSL-VPN policies.

In this example, you create two dynamic IP addresses that are used in two firewall policies (deny and allow). One policy allows traffic (host state = Healthy), and the other denies traffic (host state = Infected). When CPPM sends the information, the IP addresses are assigned according to their host state: Healthy or Infected.

You can then verify that traffic from the Infected host is denied access by the deny policy, and traffic from the Healthy host is allowed access by the allow policy.

Create a REST API administrator

A REST API administrator is required to generate an authorization token for REST API messages, and to limit hosts that can send REST API messages to the FortiGate.

To create a REST API administrator in the GUI:

1. Go to *System > Administrators*.
2. Click *Create New > REST API Admin*.
3. Configure the *Username* and other information as needed.
4. Disable *PKI Group*.
5. In the *Trusted Hosts* field, enter *10.1.100.0/24*.

New REST API Admin

Username: cpi-back

Comments: / 0/255

Administrator profile: clearpass

PKI Group: ☐

CORS Allow Origin: ☐

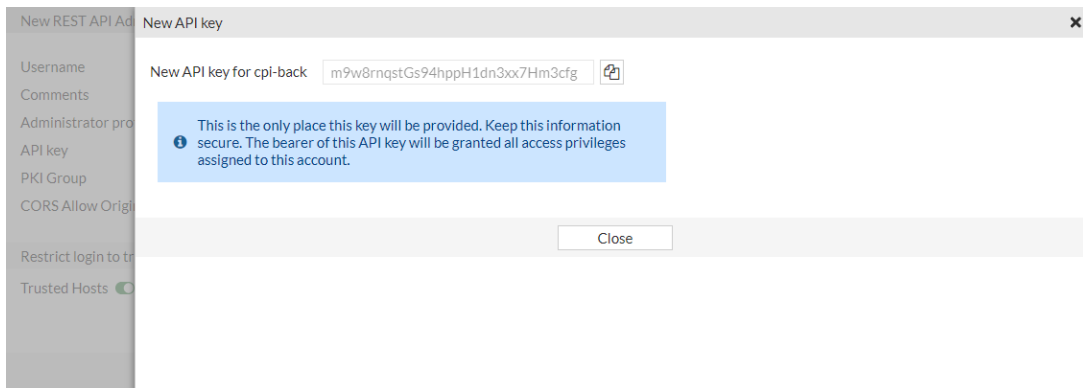

Restrict login to trusted hosts

Trusted Hosts: ☒ 10.1.100.0/24

OK Cancel

For this example, an administrator profile called *clearpass* was created with full read/write access. See [Administrator profiles on page 2416](#) for details.

6. Click **OK**.
The *New API* key pane opens.

The API key is the REST API authorization token that is used in REST API messages sent by CPPM to the FortiGate.

7. Copy the API key to a secure location. A new key can be generated if this one is lost or compromised.
8. Click *Close*.

To create a REST API administrator in the CLI:

```
config system api-user
  edit "cpi-back"
    set accprofile "clearpass"
    config trusthost
      edit 1
        set ipv4-trusthost 10.1.100.0 255.255.255.0
      next
    end
  next
end

execute api-user generate-key cp-api
  New API key: 0f1HxGHh9r9p74k7qgfHNNH40p51bjs
  NOTE: The bearer of this API key will be granted all access privileges assigned to the
  api-user cp-api.
```

Create dynamic IP addresses with the clearpass subtype

Two dynamic IP addresses are required, one for the allow policy, and the other for the deny policy.

To create the dynamic IP addresses:

```
config firewall address
  edit "cppm"
    set type dynamic
    set sub-type clearpass-spt
    set clearpass-spt healthy
    set comment ''
    set visibility enable
    set associated-interface ''
    set color 0
  next
  edit "cppm-deny"
    set type dynamic
```

```
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Create firewall policies

Two firewall policies are required, one to accept traffic (*c ppm-allow*), and the other to deny traffic (*c ppm-deny*).

To create the firewall policies in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Configure the allow policy:
 - a. Click *Create New*.
 - b. Enter a name for the policy.
 - c. Set *Source* set to *c ppm*.
 - d. Set *Action* to *ACCEPT*.
 - e. Configure the remaining settings as needed.
 - f. Click *OK*.
3. Configure the deny policy:
 - a. Click *Create New*.
 - b. Enter a name for the policy.
 - c. Set *Source* set to *c ppm-deny*.
 - d. Set *Action* to *DENY*.
 - e. Configure the remaining settings as needed.
 - f. Click *OK*.

To create the firewall policies in the CLI:

```
config firewall address
    edit "c ppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "c ppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
```

```

    next
end

```

Verification

Go to **Log & Report > Forward Traffic** to review traffic logs and ensure that traffic is allowed or denied as expected.

To verify that FortiGate addresses are assigned correctly, enter the following:

```

# diagnose firewall dynamic list
List all dynamic addresses:
cppm-deny: ID(141)
            ADDR(10.1.100.188)

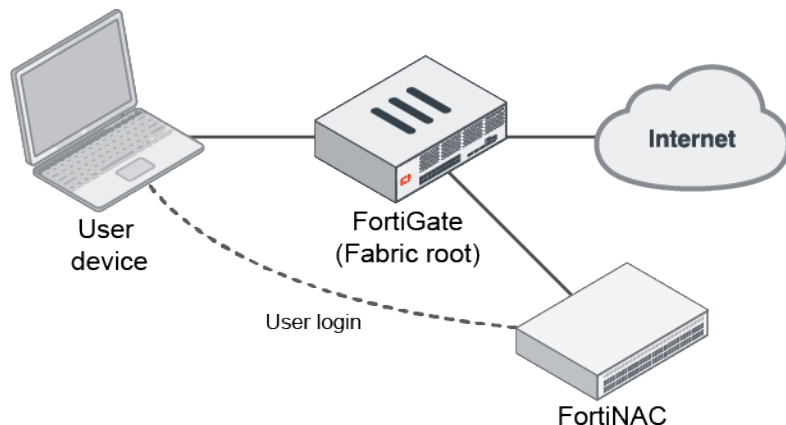

cppm: ID(176)
      ADDR(10.1.100.185)
      ADDR(10.1.100.186)

```

FortiNAC tag dynamic address

The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered.

In the following example, the user connecting to the network will be required to first log on to the FortiNAC. When the login succeeds, the logon information is synchronized to the FortiGate using the REST API. The FortiGate updates the dynamic firewall address object with the user and IP information of the user device. This firewall address is used in firewall policies to dynamically allow network access for authenticated users, thereby allowing SSO for the end user.

This example assumes the following:

- The FortiGate is the Security Fabric root device (refer to [Configuring the root FortiGate and downstream FortiGates on page 2770](#) for more information).
- The FortiNAC is running version 9.2.2 (or later), and it is connected to the Security Fabric (refer to [Configuring FortiNAC on page 2829](#) for more information).
- Firewall tags and groups have been assigned in FortiNAC to the registered FortiGate (refer to [Virtualized Devices](#) for more information). Unlike firewall tags, which are simple labels that can be configured on FortiNAC, firewall groups can be local, built-in, user-defined, or remote user groups imported from a remote server used for user authentication. Only groups that the user of the current logon event belongs to are sent to the FortiGate. Firewall tags are sent for all user authentication.

To use a FortiNAC tag dynamic firewall address in a policy:

1. Trigger two user logon events on the FortiNAC.
2. In FortiOS, go to *Policy & Objects > Addresses*, and expand the *FortiNAC Tag (IP Address)* section to view the newly created dynamic firewall address objects. The dynamic firewall addresses matching the current user logon status on FortiNAC have the current IP address of user devices. The addresses without matching user logons are marked with a red exclamation mark (!).

4. Configure the settings as needed, then click **OK**. In this policy, traffic can only pass if it originates from any of the mapped IP addresses (10.1.100.184 and 10.1.100.185); other traffic cannot pass.
5. Hover over the address in the policy, then in the tooltip, click **View Matched Addresses**.

6. Have one of the users log off from the FortiNAC.
7. In FortiOS, go to **Policy & Objects > Addresses** and verify the **FortiNAC Tag** addresses. A user logged off from 10.1.100.184, so now only 10.1.100.185 is mapped to the dynamic firewall objects.

Create New Edit Clone Delete Search Synchronized						
Name	Details	Interface	Fabric Sync	Type	Ref.

cp-healthy			Disable	Address	0	

All firewall policies using those objects are automatically updated.

8. Go to **Policy & Objects > Firewall Policy**. Hover over the address in the policy, then in the tooltip, click **View Matched Addresses**.

The firewall policy was automatically updated so that traffic from 10.1.100.184 can no longer pass, and only traffic from 10.1.100.185 can pass.

FortiVoice tag dynamic address - NEW

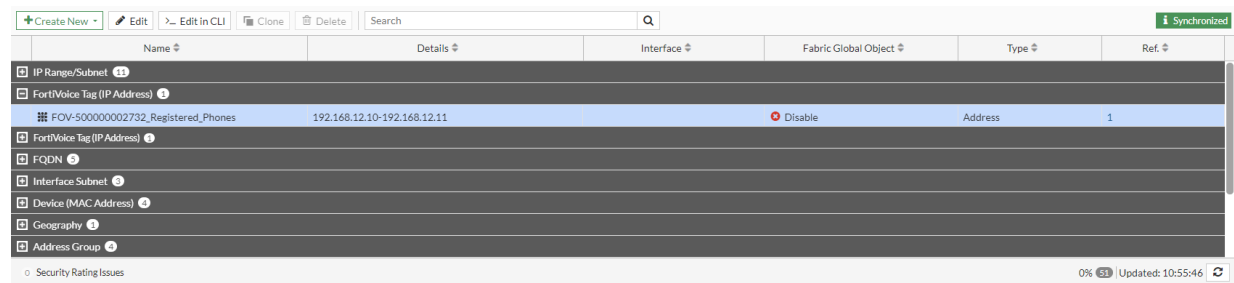

When a FortiVoice-supplied MAC or IP address is used in a firewall policy, a FortiVoice tag (MAC/IP) dynamic address is automatically created on the FortiGate that contains all the provisioned FortiPhones registered with FortiVoice. The dynamic address can be used in firewall policies to restrict rules to authorized FortiPhones only. This is useful for large voice deployments that require security and efficiency.

Example

In this example, two FortiPhones are registered to FortiVoice and are assigned names and extension numbers. A FortiVoice Fabric connector has been authorized to join the Security Fabric. The dynamic FortiVoice tags are applied to a firewall policy.

To use a FortiVoice tag dynamic firewall address in a policy:

- 1. Configure and authorize the FortiVoice Fabric connector (see [Configuring FortiVoice on page 2836](#) for more information).
- 2. Go to *Policy & Objects > Addresses* to view the newly created dynamic firewall address objects:
 - a. Expand the *FortiVoice Tag (IP Address)* section.

Name	Details	Interface	Fabric Global Object	Type	Ref.
IP Range/Subnet					
FortiVoice Tag (IP Address)					
FOV-500000002732_Registered_Phones	192.168.12.10-192.168.12.11		Disable	Address	1
FortiVoice Tag (IP Address)					
FQDN					
Interface Subnet					
Device (MAC Address)					
Geography					
Address Group					

- There is one entry, *FOV-500000002732_Registered_Phones*, which matches 192.168.12.10 to 192.168.12.11.
- b. Expand the *FortiVoice Tag (MAC Address)* section. There is one entry, *MAC_FOV-500000002732_Registered_Phones*, which matches two devices. Hover over the device serial number to view the tooltip that

contains the MAC address and additional information.

Name	Details	Interface	Type	Ref.
IP Range/Subnet				
FABRIC_DEVICE			Address	0
FIREWALL_AUTH_PORTAL_ADDRESS	0.0.0/0		Address	0

0% Updated: 15:40:03

3. Go to **Policy & Objects > Firewall Policy** and click **Create new** or edit an existing policy.
4. In the **Source** field, click the **+** and add the **FOV-500000002732_Registered_Phones** and **MAC_FOV-500000002732_Registered_Phones** addresses.
5. In the **Destination** field, click the **+** and add the **FOV-500000002732_Registered_Phones** address.
6. Configure the other settings as needed.
7. Click **OK**.

MAC addressed-based policies

MAC addresses can be added to the following IPv4 policies:

- Firewall
- Virtual wire pair
- ACL
- Central SNAT
- DoS

A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range.

FortiOS only supports the MAC address type as source address for policies in NAT mode VDOM. When you use the MAC address type in a policy as source address in NAT mode VDOM, IP address translation (NAT) is still performed according to the rules defined in the policy. The MAC address type only works for source address matching. It does not have any association with NAT actions.

For policies in transparent mode or the virtual wire pair interface, you can use the MAC address type as source or destination address.

To configure a MAC address using the GUI:

1. Go to **Policy & Objects > Addresses** and click **Create New > Address**.
2. Enter a name.
3. For **Category**, select **Address**.
4. For **Type**, select **Device (MAC Address)**.

5. Enter the MAC address.

6. Click OK.

7. Go to *Policy & Objects > Firewall Policy* to apply the address type to a policy in NAT mode VDOM:

- a. For *Source*, select the MAC address you just configured.
- b. For *Destination*, select an address.

In NAT mode VDOM, this address type cannot be used as destination address.

- c. Configure the other settings as needed.
- d. Click OK.

To configure a MAC address using the CLI:

1. Create a new MAC address:

```
config firewall address
  edit "test-mac-addr1"
    set type mac
    set macaddr 00:0c:29:41:98:88
  next
end
```

2. Apply the address type to a policy. In transparent mode or the virtual wire pair interface, this address type can be mixed with other address types in the policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "test-mac-addr1" "10-1-100-42"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
```

```

        set nat enable
    next
end

```

Device & OS Identification dynamic address subtype

Another type of MAC address object is the dynamic *Device & OS identification* subtype. This firewall address subtype is an advanced feature that can be used in policies that support dynamic address subtypes, and it relies on device detection configured on the interface connected to user devices to determine device information.

The FortiGate will update the dynamic address used in firewall policies based on the MAC address and other device and OS information for devices matching configured criteria. The criteria could be hardware vendor, hardware model, software OS, software version, or a combination of these parameters.

Only existing devices whose device information has already been detected by the FortiGate and is known can be added to this dynamic address subtype.

Similar to MAC address-based objects, the dynamic address subtype can be used as a source address for firewall policies, proxy policies, and ZTNA rules. The dynamic address subtype can be used as a source or destination address for transparent mode policies or a virtual wire pair policy.

To use the dynamic *Device & OS Identification* subtype, go to *System > Feature Visibility* and enable *Dynamic Device & OS Identification*. Once enabled, the dynamic address subtype can be configured on the *Policy & Objects > Addresses* page.

ISDB well-known MAC address list

The Internet Service Database (ISDB) includes well-known vendor MAC address range lists. The lists can only be used for source MAC addresses in IPv4 policies, and include the vendor name and the MAC address ranges that the vendor belongs to.

To view the vendor list:

```

# diagnose vendor-mac id
Please input Vendor MAC ID.
ID: 1 name: "Asus"
ID: 2 name: "Acer"
ID: 3 name: "Amazon"
ID: 4 name: "Apple"
ID: 5 name: "Xiaomi"
ID: 6 name: "BlackBerry"
ID: 7 name: "Canon"
ID: 8 name: "Cisco"
ID: 9 name: "Linksys"
ID: 10 name: "D-Link"
ID: 11 name: "Dell"
ID: 12 name: "Ericsson"
ID: 13 name: "LG"
ID: 14 name: "Fujitsu"
ID: 15 name: "Fitbit"

```

```
ID: 16 name: "Fortinet"
ID: 17 name: "OPPO"
ID: 18 name: "Hitachi"
ID: 19 name: "HTC"
ID: 20 name: "Huawei"
ID: 21 name: "HP"
ID: 22 name: "IBM"
ID: 23 name: "Juniper"
ID: 24 name: "Lenovo"
ID: 25 name: "Microsoft"
ID: 26 name: "Motorola"
ID: 27 name: "Netgear"
ID: 28 name: "Nokia"
ID: 29 name: "Nintendo"
ID: 30 name: "PaloAltoNetworks"
ID: 31 name: "Polycom"
ID: 32 name: "Samsung"
ID: 33 name: "Sharp"
ID: 34 name: "Sony"
ID: 35 name: "Toshiba"
ID: 36 name: "VMware"
ID: 37 name: "Vivo"
ID: 38 name: "Zyxel"
ID: 39 name: "ZTE"
```

To view the MAC address ranges for a vendor:

```
# diagnose vendor-mac id 16
Vendor MAC: 16(Fortinet)
Version: 0000700021
Timestamp: 201908081432
Number of MAC ranges: 6
00:09:0f:00:00:00 - 00:09:0f:ff:ff:ff
04:d5:90:00:00:00 - 04:d5:90:ff:ff:ff
08:5b:0e:00:00:00 - 08:5b:0e:ff:ff:ff
70:4c:a5:00:00:00 - 70:4c:a5:ff:ff:ff
90:6c:ac:00:00:00 - 90:6c:ac:ff:ff:ff
e8:1c:ba:00:00:00 - e8:1c:ba:ff:ff:ff
```

To query the vendor of a specific MAC address or range:

```
# diagnose vendor-mac match 00:09:0f:ff:ff:ff 48
Vendor MAC: 16(Fortinet), matched num: 1
```

To use the vendor ID in a firewall policy:

```
config firewall policy
    edit 9
        set name "policy_id_9"
        set uuid 6150cf30-308d-51e9-a7a3-bcbd05d61f93
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set vendor-mac 36 16
        set action accept
```

```
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Only packets whose source MAC address belong to Fortinet or VMware are passed by the policy.

IPv6 MAC addresses and usage in firewall policies

Users can define IPv6 MAC addresses that can be applied to the following policies:

- Firewall
- Virtual wire pair
- ACL/DoS
- Central NAT
- NAT64
- Local-in

In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. In this example, a firewall policy is configured in a NAT mode VDOM with the IPv6 MAC address as a source address.

IPv6 MAC addresses cannot be used as destination addresses in VDOMs when in NAT operation mode.

To configure IPv6 MAC addresses in a policy in the GUI:

1. Create the MAC address:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. For *Category*, select *IPv6 Address*.
 - c. Enter an address name.
 - d. For *Type*, select *Device (MAC Address)*.

- e. Enter the the MAC address.

The screenshot shows the 'New Address' configuration window in FortiGate. The 'IPv6 Address' tab is active. The 'Name' field is 'test-ipv6-mac-addr-1'. The 'Type' is 'Device (MAC Address)'. The 'MAC address' field is '00:0c:29:b5:92:8d'. The 'Comments' field is empty. The right sidebar shows 'FortiGate-VM64' and 'Additional Information' with links to 'API Preview', 'Dynamic Address', and 'Guides'.

- f. Click OK.

2. Configure the policy:

- Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- For *Source*, select the IPv6 MAC address object.
- Configure the other settings as needed.
- Click OK.

To configure IPv6 MAC addresses in a policy in the CLI:

1. Create the MAC address:

```
config firewall address6
  edit "test-ipv6-mac-addr-1"
    set type mac
    set macaddr 00:0c:29:b5:92:8d
  next
end
```

2. Configure the policy:

```
config firewall policy
  edit 2
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "test-ipv6-mac-addr-1" "2000-10-1-100-0"
    set dstaddr6 "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set auto-asic-offload disable
    set nat enable
  next
end
```

Protocol options

Firewall policies contain a *Protocol Options* field that defines the parameters for handling protocol-specific traffic. Multiple protocol options profiles can be configured in FortiOS since the requirements may differ between policies. A single protocol options profile is applied per policy, but the profile can be used in multiple policies.

To create a protocol options profile, go to *Policy & Objects > Protocol Options*. The following settings can be configured.

Log oversized files

Enable this option to log the occurrence of oversized files being processed. This does not change how they are processed. It only allows the FortiGate to log that they were either blocked or allowed through.

It is common practice to allow larger files through without antivirus processing. Monitor the logs for the frequency of oversized file processing to determine whether or not to alter the settings for treating oversized files. The threshold setting for oversized files and emails is located in the *Common Options* section.

RPC over HTTP

This protocol is used by Microsoft Exchange Servers to perform virus scanning on emails that use RPC over HTTP.

Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- | | | |
|--------|--------|--------|
| • HTTP | • IMAP | • MAPI |
| • SMTP | • FTP | • DNS |
| • POP3 | • NNTP | • CIFS |

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Common options

The *Comfort Clients* and *Block Oversized File/Email* options apply to multiple protocols.

Comfort clients

When proxy-based antivirus scanning is enabled, the FortiGate buffers files as they are downloaded. Once the entire file is captured, the FortiGate begins scanning the file. The user must wait during the buffering and scanning procedure.

After the scan is completed and if no infection is found, the file is sent to the next step in the process flow. If the file is large, this part of the process can take some time. In some cases, enough time that some users may get impatient and cancel the download.

The *Comfort Clients* option mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete. The user is aware that processing is taking place, and that there has not been a failure in the transmission. The slow transfer rate continues until the antivirus scan is complete. The transfer will proceed at full speed once the file is scanned successfully and does not contain any viruses.

If there is evidence of an infection, the FortiGate caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client has already started. Instead, the download stops and the user is left with a partially downloaded file. If the user tries to download the same file again within a short period of time, the cached URL is matched and the download is blocked. A notification is displayed that the download was blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting is available for HTTP and FTP traffic. If the FortiGate supports SSL content scanning and inspection, client comforting can be configured for HTTPS and FTPS traffic.

Buffering the entire file allows the FortiGate to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. This buffering is performed whenever the *Comfort Clients* option is disabled.

Client comforting can send unscanned and potentially infected content to the client, so only enable this option if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

Block oversized files and emails

This option is related to antivirus scanning. The FortiGate has a finite amount of resources to buffer and scan a file. If a large file (such as an ISO image or video file) is downloaded, this could overwhelm or exceed the FortiGate's memory, especially if other large files are being downloaded at the same time.

A threshold is assigned to identify an oversize file or email. The default is 10 MB. The range varies per model, and the minimum is 1 MB. Any file or email over this threshold will not be processed by policies applying the antivirus security profile.

If the FortiGate enters conserve mode on a regular basis, lowering the threshold can lessen the impact of processing the files on memory. This can increase risk, even though malware is more likely to be in smaller files.

Web options

The *Chunked Bypass* option applies to traffic containing web protocols.

Chunked bypass

Chunked bypass is a mechanism in HTTP 1.1 that allows a web server to start sending chunks of dynamically generated output in response to a request before actually knowing the actual size of the content. For dynamically generated

content, enabling chunked bypass speeds up the initial response to HTTP requests, but the content is not held in the proxy as an entire file before proceeding.

Email options

The *Allow Fragmented Messages* and *Append Signature (SMTP)* options apply to email protocols.

Allow fragmented messages

The specifications of RFC 2046 allow for the breaking up of emails and sending the fragments in parallel to be rebuilt and read at the other end by the mail server. It was originally designed to increase the performance over slower connections where larger email messages were involved. Feasibility of using this function depends on the mail configuration. Outside of Microsoft Outlook, not many email clients are set up to break up messages like this. The drawback of this feature is that if malware is broken up between multiple fragments of the message, there is a risk that it will not be detected by some antivirus configurations because all the code may not be present at the same time to identify the malware.

Append signature

This option adds a plain text email signature to SMTP email messages as they pass through the FortiGate. The message maximum is 1023 characters.

This feature works best in an environment where there is some standardization of what goes into the senders' personal signatures so that there is no duplication or contradiction of information. For example:

- *This email should not be forwarded without prior approval.*
- *Please consider the environment before printing this email.*
- *For questions regarding purchasing our products, please call ...*

Traffic shaping

A FortiGate provides quality of service (QoS) by applying bandwidth limits and prioritization to network traffic. Traffic shaping is one technique used by the FortiGate to provide QoS. A basic approach to traffic shaping is to prioritize higher priority traffic over lower priority traffic during periods of traffic congestion. This provides a stabilizing effect for important traffic while throttling less important traffic.

The FortiGate can be configured to deliver traffic shaping with policing or traffic shaping with queuing. The general difference between the two is as follows:

Technique	Description
Traffic shaping with policing	When traffic exceeds the configured bandwidth limits, traffic is dropped.
Traffic shaping with queuing	When traffic exceeds the configured bandwidth limits, traffic is delayed for transport until bandwidth frees up. Traffic may be dropped if the queues are full.

Policing and queuing can both prioritize traffic and deliver guaranteed bandwidth and maximum bandwidth by setting bandwidth limits. The implementation differs though, since queuing uses queues, and policing does not. In queuing,

before a packet egresses an interface, it is first enqueued to a queue using an algorithm such as RED or FIFO. The kernel dequeues the packet based on the HTB algorithm before sending it out. In policing, traffic simply drops if it is over the allocated bandwidth.

The following topics provide information about configuring traffic shaping:

- [Traffic shaping policies on page 1344](#)
- [Traffic shaping profiles on page 1353](#)
- [Traffic shapers on page 1363](#)
- [Global traffic prioritization on page 1378](#)
- [DSCP matching and DSCP marking on page 1381](#)
- [Examples on page 1385](#)

Configuration methods

There are different methods to configure traffic shaping on the FortiGate. The following table lists the methods and their capabilities in order of preference. If all three methods are configured, the first will be preferred over the second, which is preferred over the third.

Method	Policing		Queuing
	Traffic prioritization	Guaranteed and maximum bandwidth limits	Traffic queuing
Traffic shaping profile *	Yes	Yes, based on percentage of outbandwidth	Yes
Traffic shaper	Yes	Yes, based on rate	No
Global traffic prioritization	Yes	No	No

* Traffic shaping profiles are configured as either policing or queuing types. Queuing allows for additional options when configuring a shaping class entry.

The features of each method's implementation are slightly different. The following is a brief summary of the traffic policing features and the approach each method takes.

Traffic prioritization

The FortiGate can place packets into different priority levels in order to prioritize certain traffic over others.

Method	Description
Traffic shaping profile	Traffic is placed into classes. A total of 30 classes are available. For each class, traffic can be configured into five priority levels.
Traffic shaper	Traffic can be prioritized into the high (2), medium (3), or low (4) levels. When traffic is below the guaranteed bandwidth of the shaper, the traffic is automatically applied the critical level (1).

Method	Description
Global traffic prioritization	Traffic is prioritized into high (2), medium (3), or low (4) based on ToS (type of service) or DSCP.

Guaranteed and maximum bandwidth limits

The general purpose for configuring guaranteed bandwidth is to allocate a certain proportion of the total outbandwidth to guarantee transport for a certain type of traffic. This is configured and handled differently in each method.

A traffic shaping profile, when applied to an interface's egress shaping profile, can be configured to use up to 100% of the interface's configured bandwidth between all the classes. It does not matter what priority is configured in each class. The guaranteed bandwidth is always honored.

Traffic shapers, however, do not have a hard limit on the guaranteed bandwidth. Administrators need to be aware how much guaranteed bandwidth has been allocated to all their traffic shapers, so that they do not exceed the total outbandwidth of an interface. Traffic under the guaranteed bandwidth of a traffic shaper is given a priority of one. If the total traffic with priority one exceeds the total outbandwidth, traffic can be dropped.

The maximum bandwidth limit caps the maximum bandwidth that can be used. This is configured as a percentage of the outbandwidth in a traffic shaping profile. It is configured as a rate for traffic shapers.

Configuring outbandwidth

Traffic shaping is generally configured for egress traffic leaving the FortiGate. Therefore, it is necessary for the interface outbandwidth to be defined for traffic prioritization to take place in all of the traffic shaping configuration methods. Interface outbandwidth is also needed when defining the guaranteed and maximum bandwidth in a traffic shaping profile.

For traffic shapers, configuring outbandwidth is not necessary to apply maximum bandwidth limits; however, outbandwidth is necessary for guaranteed bandwidth. Traffic under the guaranteed bandwidth limit on a traffic shaper is given priority 1. If outbandwidth is not configured, traffic prioritization does not take place and the priority is meaningless.

Traffic shaping policy

Traffic shaping profiles and traffic shapers are methods of policing traffic. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class.

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. For example, it can match traffic based on source and destination IP, service, application, and URL category. One common use case is to match traffic based on the ToS or DS (differentiated services) field in the IP header. This allows Type of Service or Differentiated Services (DiffServ) tags to be read from traffic from a downstream device and prioritized accordingly on the FortiGate.

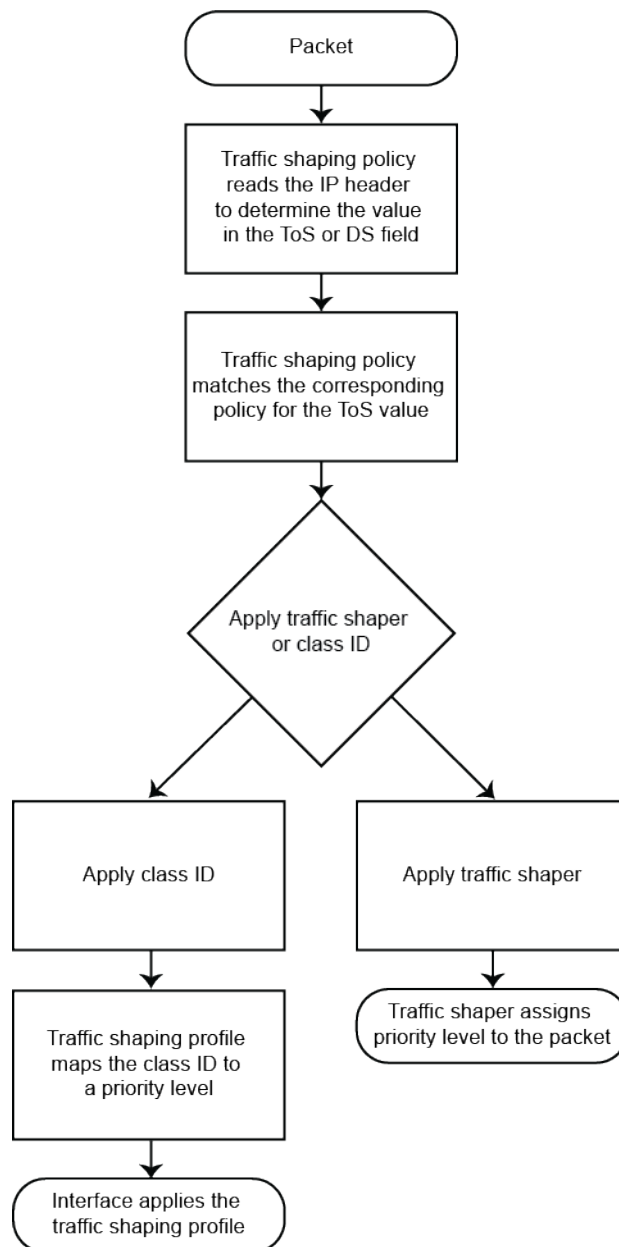

DSCP matching and DSCP marking

DSCP matching and DSCP marking can be performed on a firewall shaping policy and a regular firewall policy. DSCP matching is used to match DSCP tags from ingress traffic, and DSCP marking is used to change the DSCP tag on egress traffic.

In a firewall shaping policy and regular firewall policy, use the `tos` and `tos-mask` fields to perform DSCP matching. Use the `diffserv-forward` and `diffserv-reverse` fields to perform DSCP marking.

Traffic shaping policies

As mentioned in [Traffic shaping on page 1341](#), traffic shaping starts with the traffic shaping policy. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class. Traffic is then shaped by the shaper or the shaping profile that is applied on an interface.

Traffic can also be shaped by applying traffic shapers directly on a firewall policy. However, this legacy approach can only be configured from the CLI, and is not a preferred method for applying traffic shaping. As the number of firewall

policies increases, managing shaping on each individual policy becomes increasingly difficult. For the same reason, it is also not recommended to mix the legacy approach with traffic shaping policies to avoid the added complexity.

Overview

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. When traffic hits the firewall, the FortiGate will first look up a firewall policy, and then match a shaping policy. The matching traffic will apply a traffic shaper, class ID, or assign a DSCP DiffServ tag to the outgoing traffic.

The traffic shaping policies must be placed in the correct order in the traffic shaping policy list page to obtain the desired results. Policies are matched from top-down, so the traffic shaping policies should be arranged in a sequence that places the more granular policies above general policies.

The policy can be configured by going to *Policy & Objects > Traffic Shaping* and selecting the *Traffic Shaping Policies* tab. If the menu does not display the traffic shaping settings, go to *System > Feature Visibility* and enable *Traffic Shaping*.

Configuring traffic shaping policies

A traffic shaping policy can be split into two parts:

- Options used to match the traffic
- Options used to apply actions to the matched traffic

In the GUI, the options are configured in the *If Traffic Matches* and *Then* sections. In the CLI, all options are configured under `config firewall shaping-policy`. Some options can only be configured from the CLI.

The following options can be configured for traffic matching criteria:

GUI option	CLI option	Description
<i>Source</i>		
<i>Address</i>	<code>set srcaddr <address_object></code>	Select the address object to match the source IP.
<i>User</i>	<code>set users <user_object></code>	Select the user object to match the user authenticated for the session.
<i>Internet Service</i>	<pre>set internet-service-src enable set internet-service-src-name <name> set internet-service-src-group <group> set internet-service-src-custom <custom> set internet-service-src-custom-group <custom_group></pre>	Select the internet service to match the source of the incoming traffic. Internet service currently cannot be used with source address.
<i>Destination</i>		

GUI option	CLI option	Description
<i>Address</i>	<code>set dstaddr <address_object></code>	Select the address object to match the destination IP.
<i>Internet Service</i>	<code>set internet-service enable</code> <code>set internet-service-name <name></code> <code>set internet-service-group <group></code> <code>set internet-service-custom <custom></code> <code>set internet-service-custom-group <custom_group></code>	Select the internet service to match the destination of the incoming traffic. Internet service currently cannot be used with destination address and service.
<i>Schedule</i>	<code>set schedule <schedule></code>	Enable to select a schedule (one-time, recurring, or group).
<i>Service</i>	<code>set service <service></code>	Select the service or service group for the traffic.
<i>Application</i>		Application control must be enabled in the related firewall policy to learn the application of the traffic.
<i>Application</i>	<code>set application <application></code>	Select the application to match the application of the traffic.
<i>Category</i>	<code>set app-category <category></code>	Select the application category to match the application of the traffic.
<i>Group</i>	<code>set app-group <groups></code>	Select the application group to match the application of the traffic.
<i>URL Category</i>	<code>set url-category <category></code>	<p>Select the URL category to match the URL of the traffic.</p> <p>A web filter profile must be enabled in the related firewall policy to know the URL of the traffic (see Web filter on page 1476).</p>
n/a	<code>set tos-mask <hexadecimal_mask></code> <code>set tos <value></code> <code>set tos-negate {enable disable}</code>	<p>Specify the type of service (ToS) and mask to match.</p> <p>These options can only be configured in the CLI.</p>

The following options can be configured for actions to apply to the matched traffic:

GUI option	CLI option	Description
<i>Outgoing interface</i>	<code>set dstintf <interface></code>	Select the destination interface that the traffic shaping applies to (required).
<i>Apply shaper</i>		

GUI option	CLI option	Description
<i>Shared shaper</i>	<code>set traffic-shaper <shaper></code>	Select the shared shaper to be applied to traffic in the ingress-to-egress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to upload or outbound traffic.
<i>Reverse shaper</i>	<code>set traffic-shaper-reverse <shaper></code>	Select the reverse shaper to be applied to traffic in the egress-to-ingress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to download or inbound traffic.
<i>Per-IP shaper</i>	<code>set per-ip-shaper <shaper></code>	Select the per-IP shaper. Per-IP shapers affect downloads and uploads. The allotted bandwidth applies to each individual IP. In a shared shaper, the allotted bandwidth applies to all IPs.
<i>Assign shaping class ID</i>		
<i>Traffic shaping class ID</i>	<code>set class-id <class></code>	Set the class ID to apply the matching traffic. Class IDs are further prioritized within a traffic shaping profile and applied to an interface.
n/a	<code>set diffserv-forward {enable disable}</code> <code>set diffservcode-forward <code></code> <code>set diffserv-reverse {enable disable}</code> <code>set diffservcode-reverse <code></code>	<p>Specify the settings to apply a DSCP tag to the forward or reverse traffic. The DiffServ code is in 6-bit binary format.</p> <p>These options can only be configured in the CLI.</p>

Traffic shapers and class IDs can be applied at the same time when configuring traffic shaping policies. However, to reduce the complexity, it is recommended to use one method over the other.

The following topics include examples with traffic shaping policies:

- [Local-in and local-out traffic matching on page 1347](#)
- [VLAN CoS matching on a traffic shaping policy on page 1350](#)
- [Interface-based traffic shaping profile on page 1385](#)
- [Shared traffic shaper on page 1363](#)
- [Per-IP traffic shaper on page 1368](#)

Local-in and local-out traffic matching

A FortiGate can apply shaping policies to local traffic entering or leaving the firewall interface based on source and destination IP addresses, ports, protocols, and applications.

```
config firewall shaping-policy
  edit <id>
    set traffic-type {forwarding | local-in | local-out}
```

```

    next
end

```

This topic contains the following examples:

- [Example 1: local-in traffic shaping](#)
- [Example 2: local-out traffic shaping](#)

Example 1: local-in traffic shaping

In this example, the traffic shaping policy applies to local-in traffic. The local-in traffic originates from the Linux client and is destined to port1 on the FortiGate.

To configure the traffic shaping policy:

```

config firewall shaping-policy
    edit 2
        set traffic-type local-in
        set service "ALL"
        set schedule "always"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end

```

To verify the configuration:

1. Check the shaping policy information for local-in traffic to verify that the correct class ID (3) is applied:

```

# diagnose firewall iprope list 100018
policy index=2 uuid_idx=1300 action=accept
flag (0):
schedule(always)
cos_fwd=0 cos_rev=0
group=00100018 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
    [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 3

```

2. Check the session list to verify that the class ID (3) matches the shaping policy ID (2):

```

# diagnose sys session list
session info: proto=6 proto_state=01 duration=1195 expire=3574 timeout=3600
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=

```

```

reply-shaper=
per_ip_shaper=
class_id=3 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log local may_dirty
statistic(bytes/packets/allow_err): org=18274/350/1 reply=826037/603/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 1/0
origin->sink: org pre->in, reply out->post dev=17->34/34->17 gwy=172.16.200.2/0.0.0.0
hook=pre dir=org act=noop 172.16.200.254:55432->172.16.200.2:443(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.2:443->172.16.200.254:55432(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=08:5b:0e:7d:42:db
misc=0 policy_id=4294967295 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=1
serial=0000009d tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason: local

```

Example 2: local-out traffic shaping

In this example, the traffic shaping policy applies to local-out traffic. The local-out traffic originates from port2 on the FortiGate and is destined to an external web server.

To configure the traffic shaping policy:

```

config firewall shaping-policy
  edit 3
    set traffic-type local-out
    set service "ALL"
    set schedule "always"
    set class-id 2
    set srcaddr "all"
    set dstaddr "all"
  next
end

```

To verify the configuration:

1. Check the shaping policy information for local-out traffic to verify that the correct class ID (2) is applied:

```

# diagnose firewall iprope list 100019
policy index=3 uuid_idx=1301 action=accept
flag (0):
schedule(always)
cos_fwd=0 cos_rev=0
group=00100019 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,

```

```

dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
    [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 2

```

2. Check the session list to verify that the class ID (2) matches the shaping policy ID (3):

```

# diagnose sys session list
session info: proto=6 proto_state=05 duration=40 expire=110 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=255/255
state=log local
statistic(bytes/packets/allow_err): org=3676/14/1 reply=3848/11/1 tuples=2
tx speed(Bps/kbps): 90/0 rx speed(Bps/kbps): 94/0

npu_state=00000000
no_ofld_reason: local

```

VLAN CoS matching on a traffic shaping policy

A FortiGate can use the class of service (CoS) value of VLAN packets as a matching criterion for shaping policies. This enables the FortiGate to prioritize traffic based on the CoS value assigned by the switch or router.

```

config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
        set cos-mask <3-bit_binary>
        set cos <3-bit_binary>
    next
end

```

```

traffic-type {forwarding
| local-in | local-
out}

```

Set the traffic type.

- forwarding: use forwarding traffic (default)
- local-in: local-in traffic
- local-out: local-out traffic

```
cos-mask <3-bit_binary>
```

Set the VLAN CoS evaluated bits, 3-bit binary (000 - 111). This setting is only available for forwarding traffic.

```
cos <3-bit_binary>
```

Set the VLAN CoS bit pattern, 3-bit binary (000 - 111). This setting is available once `cos-mask` is configured.

Example

In this example, FortiGate A forwards traffic to FortiGate B with VLAN CoS 3, which matches firewall policy 6. When FortiGate B receives traffic, it applies the traffic shaping policy and will prioritize based on the CoS value.

The VLAN CoS range is 000 to 111 (0 - 7), which includes the following values: 000, 001, 010, 011, 100, 101, 110, and 111. The `cos` and `cos-mask` settings can be used to match multiple `vlan_cos` values with a single shaping policy. The following matching logic is used: $(\text{vlan_cos AND cos-mask}) == (\text{cos AND cos-mask})$.

To match all possible `vlan_cos` values, set the `cos-mask` to 000.

To configure VLAN CoS marking with traffic shaping:

1. Configure the firewall policy on FortiGate A with VLAN CoS forwarding:

```

config firewall policy
  edit 6
    set srcintf "port1"
    set dstintf "vlan100"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set vlan-cos-fwd 3
  next
end

```

Traffic marked with CoS 3 will be forwarded to FortiGate B.

2. On FortiGate A, check the session list to verify that CoS 3 is marked:

```

# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=3/255
state=log may_dirty npu f00
statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/10.1.100.11
hook=pre dir=org act=noop 10.1.100.11:28489->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28489->10.1.100.11:0(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01 dst_mac=70:4c:a5:7d:d4:95

```

```
misc=0 policy_id=6 pol_uuid_idx=1128 auth_info=0 chk_client_info=0 vd=2
serial=000717ca tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=0x4000c00 ofld=O ofld=R
npu_info: flag=0x81/0x81, offload=8/8, ips_offload=0/0, epid=79/78, ipid=78/79,
vlan=0x0000/0x0064
vlifid=78/79, vtag_in=0x0000/0x0064 in_npu=2/2, out_npu=2/2, fwd_en=0/0, qid=0/1
```

3. Configure the traffic shaping policy to match VLAN CoS 3:

```
config firewall shaping-policy
  edit 1
    set traffic-type forwarding
    set name "vlan-cos-matching"
    set service "ALL"
    set srcintf "vlan100"
    set dstintf "vlan200"
    set class-id 2
    set cos-mask 111
    set cos 011
    set srcaddr "all"
    set dstaddr "all"
  next
end
```

Based on this shaping policy:

- `vlan_cos = 3`, which corresponds to `011`
`cos-mask = 111`
AND both get 011
- `cos-mask = 111`
`cos = 011`
AND both get 011
- **`(vlan_cos AND cos-mask) == (cos AND cos-mask)`, so traffic will pass**

The shaping policy will match `vlan_cos3`.

4. Configure the firewall policy on FortiGate B:

```
config firewall policy
  edit 3
    set srcintf "vlan100"
    set dstintf "vlan200"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
  next
end
```

5. On FortiGate B, check the session list to verify that the class ID (2) matches the shaping policy ID (1):

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=672 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=56532/673/1 reply=56532/673/1 tuples=2
tx speed(Bps/kbps): 82/0 rx speed(Bps/kbps): 82/0
orgin->sink: org pre->post, reply pre->post dev=59->61/61->59 gwy=20.20.200.3/20.20.20.1
hook=pre dir=org act=noop 10.1.100.11:28735->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28735->10.1.100.11:0(0.0.0.0:0)
src_mac=90:6c:ac:fb:bb:97 dst_mac=04:d5:90:36:73:3f
misc=0 policy_id=3 pol_uuid_idx=1245 auth_info=0 chk_client_info=0 vd=1
serial=0000160b tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x040000
no_ofld_reason: non-npu-intf
```

If a particular session matches both the firewall policy and firewall shaping-policy, then anything configured in the firewall shaping-policy overrides whatever was configured in the firewall policy.

Traffic shaping profiles

As mentioned in [Traffic shaping on page 1341](#), the three main methods of configuring traffic shaping are:

- Traffic shaping profiles
- Traffic shapers
- Global traffic prioritization

A traffic shaping profile allows traffic shaping to be configured with policing or queuing. Up to 30 classes can be defined, with prioritization and bandwidth limits configured for each class. When queuing is enabled, metrics can be configured for traffic queuing in each class.

Traffic shaping with policing

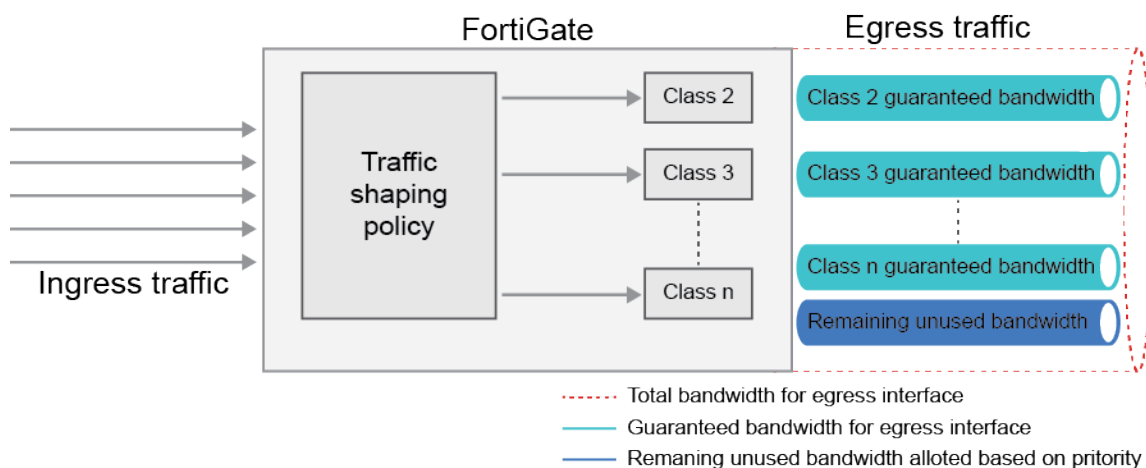

At the most basic level, policing involves traffic prioritization and bandwidth limits. Traffic prioritization helps categorize traffic into different priority levels: low, medium, high, critical, and top. When bandwidth is limited, traffic with higher priority levels will take precedence over lower priority traffic. Traffic with lower priority levels that exceeds available bandwidth will be dropped. These levels are only applicable in the context of traffic shaping profiles and should not be confused with global traffic prioritization levels.

Bandwidth limits define the guaranteed and maximum bandwidth allotted to each traffic class. These limits are configured as a percentage of the outbandwidth, which is the outbound bandwidth configured on an interface.

Guaranteed bandwidth limits guarantee the minimum bandwidth that is allotted to a given class of traffic. The sum of all guaranteed bandwidth of all classes within a traffic shaping profile cannot exceed 100%. However, the sum of all guaranteed bandwidth does not need to add up to 100%. The guaranteed bandwidth is always respected, even if one class has lower priority than another.

Maximum bandwidth limits define the maximum percentage of the outbandwidth that a traffic class can use up. This value often will be 100%, given that when there is no other traffic going through other classes, you would want to fully utilize the bandwidth of the outbound link. Traffic throughput exceeding the maximum bandwidth will be dropped.

The following diagram illustrates ingress traffic and how the FortiGate assigns classes and bandwidth to each class.

When comparing traffic shaping profiles and traffic shapers, it is important to remember that guaranteed and maximum bandwidth in a traffic shaping profile is a percentage of the outbandwidth, while guaranteed and maximum bandwidth in a traffic shaper is a rate (Kbps, Mbps, and so on). As long as the outbandwidth is true to its measurement, the bandwidth usage should not exceed the available bandwidth of a link when using a traffic shaping profile.

Congestion occurs when actual traffic surpasses the outbandwidth limit. At this point, traffic prioritization helps determine which traffic will be prioritized over others. First, the guaranteed bandwidth limit is allocated for each class. The left over bandwidth is allocated to traffic classes based on priority. The traffic classes with the highest priority can use as much of the remaining bandwidth as needed. Then, the remaining bandwidth can be allocated to classes at the next priority level, and so forth.

To see examples of applied traffic prioritization and bandwidth limits, see the debugs in [Verifying that the traffic is being shaped on page 1357](#).

Traffic shaping with queuing

When traffic congestion occurs and if there is no queuing, then the excess packets are dropped. With queuing, when traffic exceeds the configured bandwidth limits, the traffic is delayed for transport until bandwidth frees up. Traffic may still be dropped if the queues are full.

In queuing, before a packet egresses an interface, it is first enqueued using an algorithm, such as random early detection (RED) or first in, first out (FIFO). The kernel then dequeues the packet based on the HTB algorithm before sending it out. Queuing can be configured per shaping profile, and it can be customized per class.

The following diagram shows how traffic policing differs from traffic queuing by comparing the bandwidth limit, projected bandwidth utilization, and actual bandwidth utilization.

For more information about traffic shaping with queuing, see [Traffic shaping with queuing using a traffic shaping profile on page 1359](#).

Configuring traffic shaping profiles

The main steps to configure traffic shaping are:

1. Configure the traffic shaping policy, and assign matched traffic to a class (see [Traffic shaping policies on page 1344](#)).
2. Configure the traffic shaping profile and apply traffic bandwidth, prioritization and/or queuing per class.
3. Configure the interface outbandwidth and apply an egress shaping profile to the interface.

Configuring the traffic shaping profile

A traffic shaping profile consists of the class ID and the settings per class ID. It also defines the type of traffic shaping to apply (policing or queuing) and the default class ID for traffic that does not match any traffic shaping policies.

A class can be configured in the GUI as part of a traffic shaping profile or policy. In the CLI, a traffic class must be defined before it can be assigned within a traffic shaping profile. Class IDs range from 2 - 31, and they can be reused between different traffic shaping profiles.

When configuring a traffic shaping profile, the settings can be defined per class.

The following options can be configured for traffic shaping classes:

GUI option	CLI option	Description
<i>Default</i>	<code>set default-class-id <class-id></code>	Set the default class ID. Each profile must have one default class ID. The default class ID can be changed at any time.
<i>Traffic shaping class ID</i>	<code>set class-id <integer></code>	Set the class ID (2 - 31).
<i>Guaranteed bandwidth</i>	<code>set guaranteed-bandwidth-percentage <integer></code>	Set the percentage of the outbandwidth that will be guaranteed for the class ID.
<i>Maximum bandwidth</i>	<code>set maximum-bandwidth-percentage <integer></code>	Set the percentage of the outbandwidth that will be the maximum bandwidth for the class ID.
<i>Priority</i>	<code>set priority {top critical high medium low}</code>	Select the priority level for the class ID.

To configure a traffic shaping profile in the GUI:

1. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Profiles* tab, and click *Create New*.
2. Enter the profile name, and optionally enter a comment.
3. In the *Traffic Shaping Classes* section, click *Create New*.
4. Configure the traffic shaping class ID settings (*Traffic shaping class ID*, *Guaranteed bandwidth*, *Maximum bandwidth*, and *Priority*).
5. Click *OK*.
6. Create more shaping classes as needed (the total guaranteed bandwidth of all classes cannot exceed 100%).
7. Click *OK*.

To configure a traffic shaping profile in the CLI:

1. Configure the shaping class:

```
config firewall traffic-class
  edit <integer>
    set class-name <string>
  next
end
```

2. Configure the shaping profile:

```
config firewall shaping-profile
  edit <name>
    set type {policing | queuing}
    set default-class-id <class-id>
    config shaping-entries
      edit <id>
        set class-id <integer>
        set priority {top | critical | high | medium | low}
        set guaranteed-bandwidth-percentage <integer>
        set maximum-bandwidth-percentage <integer>
      next
    end
  next
end
```

Configuring the interface outbandwidth

There are two settings that must be configured on an interface that has traffic shaping applied to egressing traffic: a traffic shaping profile must be assigned, and the outbound bandwidth must be configured.

Since traffic shaping is often configured on the WAN interface for egressing traffic, the outbound bandwidth is effectively the upstream bandwidth allowed by your ISP. On the FortiGate, it is possible to perform a speed test on interfaces assigned a WAN role assigned (see [Manual interface speedtest on page 794](#)). The speed test performs measurements against public cloud servers, and provides an accurate measurement of the upstream bandwidth. After the test is complete, the results can be used to populate the *Outbound bandwidth* field.

To configure traffic shaping on an interface:

1. Go to *Network > Interfaces* and double-click an interface to edit it.
2. For interfaces assigned a WAN role, in the right-side of the screen, click *Execute speed test*.

- When the test completes, click **OK** in the *Confirm* pane to apply the results to the estimated bandwidth. The speed test results are populated in the *Estimated bandwidth* fields for *kbps Upstream* and *kbps Downstream*.

- In the *Traffic Shaping* section, enable *Outbound shaping profile* and select a profile.
- Enable *Outbound bandwidth* and copy the *kbps Upstream* value from the speed test, or enter a custom value.
- Click **OK**.

Verifying that the traffic is being shaped

In this example, three traffic classes are defined in the traffic shaping profile assigned to port1. The outbandwidth configured on port1 is 1000 Kbps. Each class has an *allocated-bandwidth*, *guaranteed-bandwidth*, *max-bandwidth*, and *current-bandwidth* value.

- The *guaranteed-bandwidth* and *max-bandwidth* are rates that are converted from the percentage of outbandwidth configured for each class. For example, *class-id 2* has 10% *guaranteed-bandwidth*, equivalent to 100 Kbps, and 100% *max-bandwidth* equivalent to 1000 Kbps.
- The *allocated-bandwidth* displays the real-time bandwidth allocation for the traffic class based on all available factors. This value changes as traffic demand changes.
- The *current-bandwidth* displays the real-time bandwidth usage detected for the traffic class.

To verify that traffic is being shaped by the traffic shaping profile:

1. Enable debug flow to view the live traffic as it matches a traffic shaping policy:

```
# diagnose debug flow show function-name enable
# diagnose debug flow show iprope enable
# diagnose debug flow filter <filters>
# diagnose debug flow trace start <repeat_number>
# diagnose debug enable
```

The `iprope_shaping_check` function outputs the shaping policy matched for any given traffic:

```
...
id=20085 trace_id=21 func=iprope_shaping_check line=934 msg="in-[port3], out-[port1],
skb_flags=02000000, vid=0"
id=20085 trace_id=21 func=__iprope_check line=2277 msg="gnum=100015, check-
fffffffffa002a8fe"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2029 msg="checked gnum=100015
policy=3, ret-matched, act-accept"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2247 msg="policy-3 is matched,
act-accept"
id=20085 trace_id=21 func=__iprope_check line=2294 msg="gnum=100015 check result: ret-
matched, act-accept, flag=00000000, flag2=00000000"
```

2. Display the session list:

```
# diagnose sys session filter <filters>
# diagnose sys session list
```

Sessions that match a shaping policy will display `class_id` and `shaping_policy_id` fields:

```
...
session info: proto=6 proto_state=05 duration=32 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=4 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
```

3. Display the interface statistics:

```
# diagnose netlink interface list port1
if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
ref=95 state=start present fw_flags=2001b800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:7e:af:a6 broadcast_addr=ff:ff:ff:ff:ff:ff
inbandwidth=10000(kbps)          total_bytes=2098887K    drop_bytes=7854K
egress traffic control:
    bandwidth=1000(kbps) lock_hit=241 default_class=3 n_active_class=3
    class-id=2          allocated-bandwidth=140(kbps)    guaranteed-bandwidth=100(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=147(kbps)
                        priority=low    forwarded_bytes=8161K
                        dropped_packets=2032    dropped_bytes=3074K
    class-id=3          allocated-bandwidth=30(kbps)    guaranteed-bandwidth=300(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=10(kbps)
                        priority=medium    forwarded_bytes=501K
                        dropped_packets=1    dropped_bytes=1195
    class-id=4          allocated-bandwidth=830(kbps)    guaranteed-bandwidth=500(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=810(kbps)
                        priority=high    forwarded_bytes=1393K
                        dropped_packets=379    dropped_bytes=572K
```

```

stat: rxp=8349728 txp=11101735 rxb=2216101183 txb=1394077978 rxe=0 txe=0 rxd=0 txd=0
mc=0 collision=0 @ time=1654202868
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=95

```

If the debug output does not display egress traffic control by class and displays them by priority, it is likely that global traffic prioritization is configured. The global traffic prioritization settings must be disabled to view the preceding debug output (see [Global traffic prioritization on page 1378](#)).

Traffic shaping with queuing using a traffic shaping profile

You can use the weighted random early detection (WRED) queuing function within traffic shaping.

This topic includes two parts:

- [Traffic shaping with queuing on page 1359](#)
- [Burst control in queuing mode on page 1360](#)

You cannot configure or view WRED in the GUI; you must use the CLI.

WRED is not supported when traffic is offloaded to an NPU.

Traffic shaping with queuing

Traffic shaping has a queuing option. Use this option to fine-tune the queue by setting the profile queue size or performing random early drop (RED) according to queue usage.

This example shows setting the profile queue size limit to 5 so that the queue can contain a maximum of five packets and more packets are dropped.

To set the profile queue size limit:

```

config firewall shaping-profile
edit "profile"
    set type queuing
    set default-class-id 31
    config shaping-entries
    edit 31
        set class-id 31
        set guaranteed-bandwidth-percentage 5
        set maximum-bandwidth-percentage 10
        set limit 5 <range from 5 to 10000; default: 1000>
    next
end
next
end

```

This example shows performing RED according to queue usage by setting `red-probability`, `min`, and `max`. Setting `red-probability` to 10 means start to drop packets when queue usage reaches the `min` setting. When queue usage reaches the `max` setting, drop 10% of the packets.

- Level 1: when queue is less than `min` packets, drop 0% of packets.
- Level 2: when queue reaches `min` packets, start to drop packets.
- Level 3: when queue usage is between `min` and `max` packets, drop 0–10% of packets by proportion.
- Level 4: when queue (average queue size) is more than `max` packets, drop 100% of packets.

To set RED according to queue usage:

```
config firewall shaping-profile
  edit "profile"
    set type queuing
    set default-class-id 31
    config shaping-entries
      edit 31
        set class-id 31
        set guaranteed-bandwidth-percentage 5
        set maximum-bandwidth-percentage 10
        set red-probability 10 <range from 0 to 20; default: 0 no drop>
        set min 100 <range from 3 to 3000>
        set max 300 <range from 3 to 3000>
      next
    end
  next
end
```

To troubleshoot this function, use the following diagnose commands:

```
diagnose netlink intf-class list <intf>
diagnose netlink intf-qdisc list <intf>
```

Burst control in queuing mode

In a hierarchical token bucket (HTB) algorithm, each traffic class has buckets to allow a burst of traffic. The maximum burst is determined by the bucket size `burst` (for guaranteed bandwidth) and `cburst` (for maximum bandwidth). The shaping profile has `burst-in-msec` and `cburst-in-msec` parameters for each shaping entry (`class id`) to control the bucket size.

This example uses the outbandwidth of the interface as 1 Mbps and the maximum bandwidth of class is 50%.

$\text{burst} = \text{burst-in-msec} * \text{guaranteed bandwidth} = 100 \text{ ms} \times 1 \text{ Mbps} \times 50\% = 50000 \text{ b} = 6250 \text{ B}$

$\text{cburst} = \text{cburst-in-msec} * \text{maximum bandwidth} = 200 \text{ ms} \times 1 \text{ Mbps} \times 50\% = 100000 \text{ b} = 12500 \text{ B}$

The following example sets `burst-in-msec` to 100 and `cburst-in-msec` to 200.

To set burst control in queuing mode:

```
config firewall shaping-profile
  edit "profile"
    set type queuing
    set default-class-id 31
    config shaping-entries
```

```
        edit 31
            set class-id 31
            set guaranteed-bandwidth-percentage 5
            set maximum-bandwidth-percentage 50
            set burst-in-msec 100 <range from 0 to 2000>
            set cburst-in-msec 200 <range from 0 to 2000>
        next
    end
next
end
```

Example

Enabling RED for FTP traffic from QA

This example shows how to enable RED for FTP traffic from QA. This example sets a maximum of 10% of the packets to be dropped when queue usage reaches the maximum value.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To set the shaping policy to classify traffic into different class IDs:

```
config firewall shaping-policy
    edit 1
        set service HTTPS HTTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 10
    next
    edit 2
        set service FTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 20
    next
end
```

To set the shaping policy to define the speed of each class ID:

```
config firewall shaping-profile
    edit QA_team_profile
        set type queuing
        set default-class-id 30
        config shaping-entries
            edit 1
                set class-id 10
```

```
        set guaranteed-bandwidth-percentage 50
        set maximum-bandwidth-percentage 100
    next
    edit 2
        set class-id 20
        set guaranteed-bandwidth-percentage 30
        set maximum-bandwidth-percentage 60
        set red-probability 10
    next
    edit 3
        set class-id 30
        set guaranteed-bandwidth-percentage 20
        set maximum-bandwidth-percentage 50
    next
end
next
end
```

To apply the shaping policy to the interface:

```
config sys interface
    edit port1
        set outbandwidth 10000
        set egress-shaping-profile QA_team_profile
    next
end
```

To use diagnose commands to troubleshoot:

```
# diagnose netlink intf-class list port1
class htb 1:1 root rate 1250000Bps ceil 1250000Bps burst 1600B/8 mpu 0B overhead 0B cburst

Traffic shapers

The following topics provide more information about traffic shapers:

- [Shared traffic shaper on page 1363](#)
- [Per-IP traffic shaper on page 1368](#)
- [Changing traffic shaper bandwidth unit of measurement on page 1371](#)
- [Multi-stage DSCP marking and class ID in traffic shapers on page 1371](#)
- [Multi-stage VLAN CoS marking on page 1373](#)
- [Adding traffic shapers to multicast policies on page 1377](#)

Shared traffic shaper

Shared traffic shaper is used in a firewall shaping policy to indicate the priority and guaranteed and maximum bandwidth for a specified type of traffic use.

The maximum bandwidth indicates the largest amount of traffic allowed when using the policy. You can set the maximum bandwidth to a value between 1 and 16776000 Kbps. The GUI displays an error if any value outside this range is used. If you want to allow unlimited bandwidth, use the CLI to enter a value of 0.

The guaranteed bandwidth ensures that there is a consistent reserved bandwidth available. When setting the guaranteed bandwidth, ensure that the value is significantly less than the interface's bandwidth capacity. Otherwise, the interface will allow very little or no other traffic to pass through, potentially causing unwanted latency.

In a shared traffic shaper, the administrator can prioritize certain traffic as high, medium, or low. FortiOS provides bandwidth to low priority connections only when high priority connections do not need the bandwidth. For example, you should assign a high traffic priority to a policy for connecting a secure web server that needs to support e-commerce traffic. You should assign less important services a low priority.

When you configure a shared traffic shaper, you can apply bandwidth shaping per policy or for all policies. By default, a shared traffic shaper applies traffic shaping evenly to all policies that use the shared traffic shaper.

When configuring a per-policy traffic shaper, FortiOS applies the traffic shaping rules defined for each security policy individually. For example, if a per-policy traffic shaper is configured with a maximum bandwidth of 1000 Kbps, any security policies that have that traffic shaper enabled get 1000 Kbps of bandwidth each.

If a traffic shaper for all policies is configured with a maximum bandwidth of 1000 Kbps, all policies share the 1000 Kbps on a first-come, first-served basis.

The configuration is as follows:

```
config firewall shaper traffic-shaper
  edit "traffic_shaper_name"
    set per-policy enable
  next
end
```

The shared traffic shaper selected in the traffic shaping policy affects traffic in the direction defined in the policy. For example, if the source port is LAN and the destination is WAN1, the traffic shaping affects the flow in this direction only, affecting the outbound traffic's upload speed. You can define the traffic shaper for the policy in the opposite direction (reverse shaper) to affect the inbound traffic's download speed. In this example, that would be from WAN1 to LAN.

Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

Traffic shapers can be added to a multicast policy when multicast routing is enabled.

The following example shows how to apply different speeds to different types of service. The example configures two shared traffic shapers to use in two firewall shaping policies. One policy guarantees a speed of 10 Mbps for VoIP traffic. The other policy guarantees a speed of 1 Mbps for other traffic. In the example, FortiOS communicates with a PC using port10 and the Internet using port9.

To configure shared traffic shapers in the GUI:

1. Create a firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set the *Name* to *Internet Access*.
 - c. Set the *Incoming Interface* to *port10*.
 - d. Set the *Outgoing Interface* to *port9*.
 - e. Set the *Source* and *Destination* to *all*.
 - f. Set the *Schedule* to *always*.
 - g. Set the *Service* to *ALL*.
 - h. Click *OK*.
2. Create the shared traffic shapers:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
 - b. Set the *Name* to *10Mbps*. This shaper is for VoIP traffic.
 - c. Set the *Traffic Priority* to *High*.
 - d. Enable *Max Bandwidth* and enter *20000*.

- e. Enable *Guaranteed Bandwidth* and enter *10000*.

The screenshot shows the 'New Traffic Shaper' configuration window. The 'Type' is set to 'Shared' and 'Per IP Shaper'. The 'Name' is '10Mbps'. Under 'Quality of Service', 'Traffic priority' is 'High', 'Bandwidth unit' is 'kbps', 'Maximum bandwidth' is '20000' kbps, and 'Guaranteed bandwidth' is '10000' kbps. 'DSCP' is disabled. The right sidebar shows 'FortiGate' logo, 'FGDocs', 'API Preview', and 'Documentation' links.

- f. Click **OK**.
- g. Repeat the above steps to create another traffic shaper named *1Mbps* with the *Traffic Priority* set to *Low*, the *Max Bandwidth* set to *10000*, and the *Guaranteed Bandwidth* set to *1000*.
3. Create a firewall shaping policy:
- Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
 - Set the *Name* to *VoIP_10Mbps_High*. This policy is for VoIP traffic.
 - Set the *Source* and *Destination* to *all*.
 - Set the *Service* to all VoIP services.
 - Set the *Outgoing Interface* to *port9*.
 - Enable *Shared shaper* and select *10Mbps*.
 - Enable *Reverse shaper* and select *10Mbps*.
 - Click **OK**.
 - Repeat the above steps to create another firewall shaping policy named *Other_1Mbps_Low* for other traffic, with the *Source* and *Destination* set to *all*, *Service* set to *ALL*, *Outgoing Interface* set to *port9*, and *Shared shaper* and *Reverse shaper* set to *1Mbps*.

To configure shared traffic shapers in the CLI:

1. Create a firewall policy:

```
config firewall policy
  edit 1
    set name "Internet Access"
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set fsso disable
    set nat enable
  next
end
```

2. Create the shared traffic shapers:

```
config firewall shaper traffic-shaper
```

```

edit "10Mbps"
    set guaranteed-bandwidth 10000
    set maximum-bandwidth 20000
next
edit "1Mbps"
    set guaranteed-bandwidth 1000
    set maximum-bandwidth 10000
    set priority low
next
end

```

3. Create a firewall shaping policy:

```

config firewall shaping-policy
edit 1
    set name "VOIP_10Mbps_High"
    set service "H323" "IRC" "MS-SQL" "MYSQL" "RTSP" "SCCP" "SIP" "SIP-MSNmessenger"
    set dstintf "port9"
    set traffic-shaper "10Mbps"
    set traffic-shaper-reverse "10Mbps"
    set srcaddr "all"
    set dstaddr "all"
next
edit 2
    set name "Other_1Mbps_Low"
    set service "ALL"
    set dstintf "port9"
    set traffic-shaper "1Mbps"
    set traffic-shaper-reverse "1Mbps"
    set srcaddr "all"
    set dstaddr "all"
next
end

```

To troubleshoot shared traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the 10Mbps and 1Mbps shapers:

```

# diagnose firewall iprope list 100015
policy index=1 uuid_idx=0 action=accept
flag (0):
shapers: orig=10Mbps (2/1280000/2560000)
cos_fwd=0 cos_rev=0

no_ofld_reason: offload-denied helper
total session 1
```

3. Check the statuses of shared traffic shapers:

```
# diagnose firewall shaper traffic-shaper list
name 10Mbps
maximum-bandwidth 2500 KB/sec
guaranteed-bandwidth 1250 KB/sec
current-bandwidth 0 B/sec
priority 2
tos ff
packets dropped 0
```

```
bytes dropped 0

name 1Mbps
maximum-bandwidth 1250 KB/sec
guaranteed-bandwidth 125 KB/sec
current-bandwidth 0 B/sec
priority 4
tos ff
packets dropped 0
bytes dropped 0
```

Per-IP traffic shaper

With per-IP traffic shaping, you can limit each IP address's behavior to avoid a situation where one user uses all of the available bandwidth. In addition to controlling the maximum bandwidth used per IP address, you can also define the maximum number of concurrent sessions for an IP address. For example, if you apply a per-IP shaper of 1 Mbps to your entire network, FortiOS allocates each user/IP address 1 Mbps of bandwidth. Even if the network consists of a single user, FortiOS allocates them 1 Mbps. If there are ten users, each user gets 1 Mbps of bandwidth, totaling 10 Mbps of outgoing traffic.

For shared shapers, all users share the set guaranteed and maximum bandwidths. For example, if you set a shared shaper for all PCs using an FTP service to 10 Mbps, all users uploading to the FTP server share the 10 Mbps.

Shared shapers affect upload speed. If you want to limit the download speed from the FTP server in the example, you must configure the shared shaper as a reverse shaper. Per-IP shapers apply the speed limit on both upload and download operations. Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply a per-IP shaper to a traffic shaping policy. This shaper assigns each user a maximum bandwidth of 1 Mbps and allows each user to have a maximum of ten concurrent connections to the FTP server. In the example, FortiOS communicates with users using port10 and the FTP server using port9.

To configure a per-IP traffic shaper in the GUI:

1. Create a firewall policy:
 - a. Go to *Policy & Objects > IPv4 Policy* and click *Create New*.
 - b. Set the *Name* to *FTP Access*.
 - c. Set the *Incoming Interface* to *port10*.
 - d. Set the *Outgoing Interface* to *port9*.
 - e. Set the *Source* to *all*.
 - f. Set the *Destination* to *FTP_Server*.
 - g. Set the *Schedule* to *always*.
 - h. Set the *Service* to *ALL*.
 - i. Click *OK*.
2. Create the per-IP traffic shaper:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
 - b. Set *Type* to *Per IP Shaper*.
 - c. Enter the *Name* (*FTP_Max_1M*). This shaper is for VoIP traffic.
 - d. Enable *Max Bandwidth* and enter *1000*.
 - e. Enable *Max Concurrent Connections* and enter *10*. This means that each user can have up to ten concurrent connections to the FTP server.

f. Click OK.

3. Create a firewall shaping policy:

- a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
- b. Enter the *Name* (*FTP speed 1M*).
- c. Set the *Source* to the addresses and users that require access to the FTP server.
- d. Set the *Destination* to *FTP_Server*.
- e. Set the *Service* to *ALL*.
- f. Set the *Outgoing Interface* to *port9*.
- g. Enable *Per-IP shaper* and select *FTP_Max_1M*.
- h. Click OK.

To configure a per-IP traffic shaper in the CLI:

1. Create a firewall policy:

```
config firewall policy
  edit 1
    set name "FTP Access"
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "FTP_Server"
    set action accept
    set schedule "always"
    set service "ALL"
    set fsso disable
    set nat enable
  next
end
```

2. Create the per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
  edit "FTP_Max_1M"
    set max-bandwidth 1000
    set max-concurrent-session 10
  next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
  edit 1
```

```

        set name "FTP speed 1M"
        set service "ALL"
        set dstintf "port9"
        set per-ip-shaper "FTP_Max_1M"
        set srcaddr "PC1" "WinPC" "PC2"
        set dstaddr "FTP_Server"
    next
end

```

To troubleshoot per-IP traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the FTP_Max_1M shaper:

```

# diagnose firewall iprope list 100015
policy index=3 uuid_idx=0 action=accept
flag (0):
shapers: per-ip=FTP_Max_1M
cos_fwd=0 cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(3): 10.1.100.11-10.1.100.11, uuid_idx=30, 10.1.100.143-10.1.100.143, uuid_idx=32,
          10.1.100.22-10.1.100.22, uuid_idx=31,
dest(1): 172.16.200.55-172.16.200.55, uuid_idx=89,
service(1):
          [0:0x0:0/(0,65535)->(0,65535)] helper:auto

```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the FTP_Max_1M shaper is applied to the session:

```

# diagnose sys session list
session info: proto=6 proto_state=01 duration=36 expire=3567 timeout=3600 flags=00000000
             sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=FTP_Max_1M
class_id=0 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
state=may_dirty per_ip npu npd mif route_preserve
statistic(bytes/packets/allow_err): org=506/9/1 reply=416/6/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=39->38/38->39 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.11:58275->172.16.200.55:21(172.16.200.1:58275)
hook=pre dir=reply act=dnat 172.16.200.55:21->172.16.200.1:58275(10.1.100.11:58275)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
serial=0000211a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id = 00000000
dd_type=0 dd_mode=0
npu_state=0x100000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,
          vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason: offload-denied helper

```

3. Check the statuses of per-IP traffic shapers. The output should resemble the following:

```

# diagnose firewall shaper per-ip-shaper list
name FTP_Max_1M

```

```

maximum-bandwidth 125 KB/sec
maximum-concurrent-session 10
tos ff/ff
packets dropped 0
bytes dropped 0
addr=10.1.100.11 status: bps=0 ses=3

```

Changing traffic shaper bandwidth unit of measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent and received are measured in megabytes (MB). In some cases, this can cause confusion depending on whether your ISP uses kilobits per second (Kbps), kilobytes per second (KBps), megabits per second (Mbps), or gigabits per second (Gbps).

You can change the unit of measurement for traffic shapers in the CLI.

To change the bandwidth unit of measurement for a shared traffic shaper:

```

config firewall shaper traffic-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end

```

To change the bandwidth unit of measurement for a per-IP traffic shaper:

```

config firewall shaper per-ip-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end

```

Multi-stage DSCP marking and class ID in traffic shapers

Traffic shapers have a multi-stage method so that packets are marked with a different differentiated services code point (DSCP) and `class id` at different traffic speeds. Marking packets with a different DSCP code is for the next hop to classify the packets. The FortiGate benefits by marking packets with a different `class id`. Combined with the egress interface shaping profile, the FortiGate can handle the traffic differently according to its `class id`.

Rule	DSCP code	Class ID
speed < guarantee bandwidth	diffservcode	class id in shaping policy
guarantee bandwidth < speed < exceed bandwidth	exceed-dscp	exceed-class-id
exceed bandwidth < speed	maximum-dscp	exceed-class-id

This example sets the following parameters:

- When the current bandwidth is less than 50 Kbps, mark packets with `diffservcode 100000` and set `class id` to 10.
- When the current bandwidth is between 50 Kbps and 100 Kbps, mark packets with `exceed-dscp 111000` and set `exceed-class-id` to 20.

- When the current bandwidth is more than 100 Kbps, mark packets with `maximum-dscp 111111` and set `exceed-class-id` to 20.

To set multi-stage DSCP marking and class ID in a traffic shaper:

```
config firewall shaper traffic-shaper
  edit "50k-100k-150k"
    set guaranteed-bandwidth 50
    set maximum-bandwidth 150
    set diffserv enable
    set dscp-marking-method multi-stage
    set exceed-bandwidth 100
    set exceed-dscp 111000
    set exceed-class-id 20
    set maximum-dscp 111111
    set diffservcode 100000
  next
end

config firewall shaping-policy
  edit 1
    set service "ALL"
    set dstintf PORT2
    set srcaddr "all"
    set dstaddr "all"
    set class-id 10
  next
end
```

Traffic shapers also have an `overhead` option that defines the per-packet size overhead used in rate computation.

To set the traffic shaper overhead option:

```
config firewall shaper traffic-shaper
  edit "testing"
    set guaranteed-bandwidth 50
    set maximum-bandwidth 150
    set overhead 14 <range from 0 to 100>
  next
end
```

Example

This example shows how to mark QA traffic with a different DSCP according to real-time traffic speed.

To configure the firewall address:

```
config firewall address
  edit QA_team
    set subnet 10.1.100.0/24
  next
end
```

To configure the firewall shaper traffic shaper:

```

config firewall shaper traffic-shaper
    edit "500k-1000k-1500k"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1500
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 1000
        set exceed-dscp 111000
        set maximum-dscp 111111
        set diffservcode 100000
    next
end

config firewall shaping-policy
    edit QA_team
        set service "ALL"
        set dstintf port1
        set traffic-shaper "500k-1000k-1500k"
        set traffic-shaper-reverse "500k-1000k-1500k"
        set srcaddr "QA_team"
        set dstaddr "all"
    next
end

```

Multi-stage VLAN CoS marking

A FortiGate can configure the traffic shaper to dynamically change the CoS value of outgoing VLAN packets based on the shaper profile. This allows the FortiGate to mark traffic with different CoS values at different stages of the shaping process.

```

config firewall shaper traffic-shaper
    edit <name>
        set bandwidth-unit {kbps | mbps | gbps}
        set guaranteed-bandwidth <integer>
        set maximum-bandwidth <integer>
        set cos-marking {enable | disable}
        set cos-marking-method {static | multi-stage}
        set cos <3-bit_binary>
        set exceed-cos <3-bit_binary>
        set maximum-cos <3-bit_binary>
        set exceed-bandwidth <integer>
    next
end

```

cos-marking {enable disable}	Enable/disable VLAN CoS marking (default = disable).
cos-marking-method {static multi- stage}	Set the VLAN CoS marking method. <ul style="list-style-type: none"> static: use static VLAN CoS marking (default) multi-stage: multi-stage VLAN CoS marking
cos <3-bit_binary>	Set the VLAN CoS mark, 3-bit binary (000 - 111).

<code>exceed-cos <3-bit_binary></code>	Set the VLAN CoS mark for traffic in <code>guaranteed-bandwidth</code> and <code>exceed-bandwidth</code> , 3-bit binary (000 - 111).
<code>maximum-cos <3-bit_binary></code>	Set the VLAN CoS mark for traffic in <code>exceed-bandwidth</code> and <code>maximum-bandwidth</code> , 3-bit binary (000 - 111).
<code>exceed-bandwidth <integer></code>	Set the exceed bandwidth used for DSCP or VLAN CoS multi-stage marking. The integer value range depends on the <code>bandwidth-unit</code> setting. This setting is only available for CoS multi-stage marking.

Example

In this example, multi-stage VLAN CoS marking is configured using traffic shapers on FortiGate A and FortiGate B. FortiGate A applies multi-stage CoS marking with the following traffic shaper settings:

- Traffic below the guaranteed bandwidth will apply CoS 6.
- Traffic greater than the guaranteed bandwidth will apply CoS 6 and 5.
- Traffic greater than the exceed bandwidth will apply CoS 6, 5, and 4.

A traffic shaper and shaping policy are configured on FortiGate B. When traffic comes from FortiGate A with CoS 6, the traffic shaping policy will be applied because the CoS matches.

Multi-stage VLAN CoS marking is not supported on NP models. Traffic is not offloaded when it is enabled.

To configure multi-stage VLAN CoS marking on FortiGate A:

1. Configure the firewall policy:

```

config firewall policy
  edit 7
    set srcintf "port1"
    set dstintf "vlan100"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set traffic-shaper "multi-stage-cos-fgta"
    set traffic-shaper-reverse "multi-stage-cos-fgta"
  next
end

```

2. Configure the traffic shaper:

```

config firewall shaper traffic-shaper
edit "multi-stage-cos-fgta"
    set guaranteed-bandwidth 1000
    set maximum-bandwidth 4000
    set per-policy enable
    set exceed-bandwidth 2000
    set cos-marking enable
    set cos-marking-method multi-stage
    set cos 110
    set exceed-cos 101
    set maximum-cos 100
next
end

```

3. Check the session list to verify that CoS 6 is marked:

```

# diagnose sys session list
session info: proto=17 proto_state=00 duration=6 expire=180 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic
504900Bps drops 163905268B
reply-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic
504900Bps drops 0B
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=6/6
state=log may_dirty npu npd os rs f00
statistic(bytes/packets/allow_err): org=3804176/292/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 583462/4667 rx speed(Bps/kbps): 0/0
origin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/0.0.0.0
hook=pre dir=org act=noop 10.1.100.11:37586->192.168.4.33:5001(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:5001->10.1.100.11:37586(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01 dst_mac=70:4c:a5:7d:d4:95
misc=0 policy_id=7 pol_uuid_idx=1129 auth_info=0 chk_client_info=0 vd=2
serial=0006613c tos=ff/ff app_list=0 app=0 url_cat=0
rpd_b_link_id=00000000 ngfwid=n/a
npu_state=0x4000000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,
vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason: offload-denied

```

To configure mutli-stage VLAN CoS marking on FortiGate B:

1. Configure the firewall policy:

```

config firewall policy
edit 4
    set srcintf "vlan100"
    set dstintf "vlan200"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all

```

```

    next
end

```

2. Configure the traffic shaper:

```

config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgtb"
        set guaranteed-bandwidth 250
        set maximum-bandwidth 1000
        set per-policy enable
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 100
        set exceed-cos 101
        set maximum-cos 110
        set exceed-bandwidth 500
    next
end

```

Based on this traffic shaper, the following CoS marking rules will be applied:

- If all traffic is less than the guaranteed bandwidth, then the traffic will be marked with CoS 4.
- If all traffic is greater than the guaranteed bandwidth but less than the exceed bandwidth, then 50% of the traffic will be marked as CoS 4 and 50% as CoS 5.
- If traffic is greater than the guaranteed bandwidth but less than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6; CoS 4 and 5 will have another 50%.
- If traffic is greater than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6, 25% will be marked as CoS 4, and 25% will be marked as CoS 5. Packet drops will be visible in the debug output.

3. Configure the traffic shaping policy:

```

config firewall shaping-policy
    edit 1
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set traffic-shaper "multi-stage-cos-fgtb"
        set traffic-shaper-reverse "multi-stage-cos-fgtb"
        set class-id 2
        set cos-mask 111
        set cos 110
        set srcaddr "all"
        set dstaddr "all"
    next
end

```

4. Check the session list to verify that the shaping ID (1) applied and CoS 4 is marked:

```

# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps drops 0B
reply-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps drops 0B
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=4/4
state=log may_dirty os rs f00

```

```

statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2

npu_state=0x040000
no_ofld_reason: non-npu-intf
total session 1

```

Adding traffic shapers to multicast policies

When multicast routing is enabled, a traffic shaper can be added to a multicast policy.

Only a shared traffic shaper with the `per-policy` option disabled can be used. This is the default state of the `per-policy` option. The `auto-asic-offload` option must also be disabled on the multicast policy.

This feature is currently not supported on IPv6 multicast policies or on transparent mode VDOMs.

Example

In this example, a traffic shaper is applied to the multicast policy. A multicast flow sender sends the multicast data stream. The shaper attached to the multicast session is checked, and the shaping of the data stream is confirmed in the multicast session.

To apply traffic shaping to a multicast policy:

1. Enable multicast routing on the VDOM:

```

config router multicast
    set multicast-routing enable
config pim-sm-global
    config rp-address
        edit 1
            set ip-address 10.1.100.10
        next
    end

```

```
end
config interface
    edit "wan2"
        set pim-mode sparse-mode
    next
    edit "wan1"
        set pim-mode sparse-mode
    next
end
end
```

2. Create a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "shaper128kbps-high"
        set guaranteed-bandwidth 128
        set maximum-bandwidth 128
        set per-policy disable
        set diffserv enable
        set diffservcode 010101
    next
end
```

3. Apply the traffic shaper to the multicast policy and disable NPU offloading:

```
config firewall multicast-policy
    edit 1
        set name "test_multicast-policy"
        set logtraffic enable
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set snat enable
        set auto-asic-offload disable
        set traffic-shaper "shaper128kbps-high"
    next
end
```

4. Check the shaper and DSCP in the multicast session:

```
# diagnose sys mcast-session list
session info: id=26 vf=0 proto=17 10.1.100.41.35537->230.0.0.1.7878
used=2 path=1 duration=118 expire=179 indev=18 pkts=119 bytes=64260
state=00000000:
session-npu-info: ipid/vlifid=0/0 vlanid/vtag_in=0/0 in_npuid=0 tae_index=0 qid=0
fwd_map=0x00000000
path: log snat npu-deny nsaddr=172.16.200.10 policy=1, outdev=17, tos=0x15
      origin-shaper=shaper128kbps-high prio=2 tos=0x15 guarantee 16000Bps max
16000Bps traffic 620Bps drops 0pkt/0B
Total 1 sessions
```

Global traffic prioritization

Global traffic prioritization allows your traffic to be prioritized as high (2), medium (3), or low (4) based on ToS (type of service) or DSCP. When using ToS-based priority, integers 0 to 15 can be used, which correspond to the definitions of

the ToS field values in RFC 1349. When using DSCP, values 0 to 63 can be used, which correspond to the six bits in the DSCP value.

The outbandwidth must be defined in order for global prioritization to take effect. When the outbandwidth is defined on an interface without an applied `egress-shaping-profile`, the interface has a total of five priority levels:

Priority level	Description
0	Top
1	Critical
2	High
3	Medium
4	Low

Priority level 0 is reserved for administrative and local out traffic. Priority level 1 is used for traffic that is below guaranteed bandwidth when using a traffic shaper.

Traffic shaper and traffic shaping profile configurations take precedence over global traffic prioritization.

CLI commands

The following commands are used to configure the prioritization either by ToS or DSCP.

To configure the traffic prioritization type and level:

```
config system global
    set traffic-priority {tos | dscp}
    set traffic-priority-level {high | medium | low}
end
```

To configure the ToS-based priority table:

```
config system tos-based-priority
    edit <id>
        set tos <0-15>
        set priority (high | medium | low)
    next
end
```

To configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit <id>
        set ds <0-63>
        set priority (high | medium | low)
    next
end
```

To configure the interface outbandwidth:

```
config system interface
  edit <name>
    set outbandwidth <bandwidth in kbps>
  next
end
```

Example

In the following configuration, packets with DSCP markings of 1 are prioritized as high, and packets with DSCP markings of 2 are prioritized as medium. All the other traffic is prioritized as low. The outbandwidth on interface port3 is set to 1000 kbps.

To configure DSCP-based traffic prioritization:

1. Configure DSCP-based prioritization in the global settings:

```
config system global
  set traffic-priority dscp
  set traffic-priority-level low
end
```

2. Configure the DSCP-based priority table:

```
config system dscp-based-priority
  edit 1
    set ds 1
    set priority high
  next
  edit 2
    set ds 2
    set priority medium
  next
end
```

3. Configure the outbandwidth on port3:

```
config system interface
  edit "port3"
    set outbandwidth 1000
  next
end
```

Verifying the traffic prioritization

When traffic exceeds the outbandwidth of 1000 kbps, traffic prioritization will take effect. Since the form of traffic shaping applied here is policing, excess packets above the outbandwidth are dropped.

In scenario 1, approximately 300 kbps of high priority traffic and 300 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
```

```

ref=35 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000 (kbps)
      priority=0      allocated-bandwidth=0 (kbps)      total_bytes=9311K      drop_
bytes=197K
      priority=1      allocated-bandwidth=0 (kbps)      total_bytes=0      drop_bytes=0
      priority=2      allocated-bandwidth=354 (kbps)      total_bytes=20407K      drop_
bytes=48K
      priority=3      allocated-bandwidth=354 (kbps)      total_bytes=7093K      drop_
bytes=1262K
      priority=4      allocated-bandwidth=290 (kbps)      total_bytes=266018K      drop_
bytes=7743K
stat: rxp=15450901 txp=25933756 rxb=5456860515 txb=17257309292 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629439926
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=35

```

High priority (2) traffic is allocated 354 kbps of bandwidth. Medium priority (3) traffic is also allocated 354 kbps of bandwidth. The remaining bandwidth is allocated to low priority (4) traffic.

In scenario 2, approximately 400 kbps of high priority traffic and 800 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```

# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000 (kbps)
      priority=0      allocated-bandwidth=7 (kbps)      total_bytes=9981K      drop_
bytes=240K
      priority=1      allocated-bandwidth=0 (kbps)      total_bytes=0      drop_bytes=0
      priority=2      allocated-bandwidth=425 (kbps)      total_bytes=31478K      drop_
bytes=101K
      priority=3      allocated-bandwidth=567 (kbps)      total_bytes=12056K      drop_
bytes=1984K
      priority=4      allocated-bandwidth=0 (kbps)      total_bytes=266795K      drop_
bytes=7771K
stat: rxp=15461740 txp=25950805 rxb=5459688950 txb=17273940560 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629440553
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36

```

High priority (2) traffic is allocated 425 kbps of bandwidth. Medium priority (3) traffic is allocated 567 kbps of bandwidth. Since the total bandwidth required exceeds 1000 kbps, the remaining medium priority (3) traffic is dropped. In comparing the successive debug outputs, the `drop_bytes` counter for medium priority (3) traffic gets bigger.

DSCP matching and DSCP marking

This feature has three parts:

- [DSCP matching in firewall policies](#)
- [DSCP matching in firewall shaping policies](#)
- [DSCP marking in firewall shaping policies](#)

DSCP matching in firewall policies

Traffic is allowed or blocked according to the Differentiated Services Code Point (DSCP) values in the incoming packets.

The following CLI variables are available in the `config firewall policy` command:

<code>tos-mask <mask_value></code>	Non-zero bit positions are used for comparison. Zero bit positions are ignored (default = 0x00). This variable replaces the <code>dscp-match</code> variable.
<code>tos <tos_value></code>	Type of Service (ToC) value that is used for comparison (default = 0x00). This variable is only available when <code>tos-mask</code> is not zero. This variable replaces the <code>dscp-value</code> variable.
<code>tos-negate {enable disable}</code>	Enable/disable negated ToS match (default = disable). This variable is only available when <code>tos-mask</code> is not zero. This variable replaces the <code>dscp-negate</code> variable.

DSCP matching in firewall shaping policies

Shaping is applied to the session or not according to the DSCP values in the incoming packets. The same logic and commands as in firewall policies are used.

DSCP marking in firewall shaping policies

Traffic is allowed or blocked according to the DSCP values in the incoming packets. DSCP marking in firewall shaping policies uses the same logic and commands as in firewall policy and traffic-shaper.

When DSCP marking on `firewall shaper traffic-shaper`, `firewall shaping-policy`, and `firewall policy` all apply to the same session, `shaping-policy` overrides `policy`, and `shaper traffic-shaper` overrides both `shaping-policy` and `policy`.

The following CLI variables in `config firewall policy` are used to mark the packets:

<code>diffserv-forward {enable disable}</code>	Enable/disable changing a packet's DiffServ values to the value specified in <code>diffservcode-forward</code> (default = disable).
<code>diffservcode-forward <dscp_value></code>	The value that packet's DiffServ is set to (default = 000000). This variable is only available when <code>diffserv-forward</code> is enabled.
<code>diffserv-reverse {enable disable}</code>	Enable/disable changing a packet's reverse (reply) DiffServ values to the value specified in <code>diffservcode-rev</code> (default = disable).
<code>diffservcode-rev <dscp_value></code>	The value that packet's reverse (reply) DiffServ is set to (default = 000000). This variable is only available when <code>diffserv-rev</code> is enabled.

Examples

Example 1

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B does DSCP matching, allowing only the sales team to access the database.

1. Configure FortiGate A:

```

config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "QA"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set diffserv-forward enable
    set diffservcode-forward 110000
    set nat enable
  next
  edit 5
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "Sales"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set diffserv-forward enable
    set diffservcode-forward 111011
    set nat enable
  next
end

```

2. Configure FortiGate B:

```

config firewall policy
  edit 2
    set srcintf "port3"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "Database"
    set action accept
    set schedule "always"
    set service "ALL"
    set tos-mask 0xf0
  
```

```
        set tos 0xe0
        set fsso disable
        set nat enable
    next
end
```

Example 2

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B uses a firewall shaping policy to do the DSCP matching, limiting the connection speed of the sales team to the database to 10MB/s.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
config firewall shaper traffic-shaper
    edit "10MB/s"
        set guaranteed-bandwidth 60000
```

```
        set maximum-bandwidth 80000
    next
end
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "port1"
        set tos-mask 0xf0
        set tos 0xe0
        set traffic-shaper "10MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Example 3

FortiGate A has a traffic shaping policy to mark traffic from the QA team with a DSCP value of 100000, while reverse traffic is marked with 000011.

1. Configure FortiGate A:

```
config firewall shaping-policy
    edit 1
        set name "QA Team 50MB"
        set service "ALL"
        set dstintf "port3"
        set traffic-shaper "50MB/s"
        set traffic-shaper-reverse "50MB/s"
        set diffserv-forward enable
        set diffserv-reverse enable
        set srcaddr "QA"
        set dstaddr "all"
        set diffservcode-forward 100000
        set diffservcode-rev 000011
    next
end
```

Examples

This section includes the following traffic shaping configuration examples:

- [Interface-based traffic shaping profile on page 1385](#)
- [Interface-based traffic shaping with NP acceleration on page 1394](#)
- [QoS assignment and rate limiting for FortiSwitch quarantined VLANs on page 1395](#)
- [Ingress traffic shaping profile on page 1396](#)

Interface-based traffic shaping profile

A traffic shaping policy can be used for interface-based traffic shaping by organizing traffic into 30 class IDs. The shaping profile defines the percentage of the interface bandwidth that is allocated to each class. Each traffic class ID is shaped to the assigned speed according to the outgoing bandwidth limit configured to the interface.

Traffic classification

A shaping policy classifies traffic and organizes it into different class IDs, based on matching criteria. For traffic matching a criteria, you can choose to put it into 30 different shaping classes, identified by class ID 2 to 31.

You must select an outgoing interface for the traffic. The shaping policy is only applied when the traffic goes to one of the selected outgoing interfaces.

Criterion	Description
Source	<ul style="list-style-type: none"> Address: match the source address of the traffic to the selected address or address group. User: use the user credentials of the traffic to match the selected user or user group. At least one address, address group, or internet service must also be selected. Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Destination	<ul style="list-style-type: none"> Address: match the destination address of the traffic to the selected address or address group. Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Schedule	Match the current date and time to the selected schedule. You can select a one-time schedule, recurring schedule, or schedule group. This setting is optional.
Service	Match the service of the traffic to the selected service or service group.
Application	<p>Match the application of the traffic to the selected application, application category, or application group.</p> <p>Application control must be enabled in the related firewall policy to know the application of the traffic. See Application control on page 1558 for more information.</p>
URL category	<p>Match the URL of the traffic to the selected URL category.</p> <p>Web filter must be enabled in the related firewall policy to know the URL of the traffic. See Web filter on page 1476 for more information.</p>

When multiple items are selected in one criterion, it is considered a match when traffic matches any one of them.

Traffic prioritization

Shaping profiles define how different shaping classes of traffic are prioritized. For each class, you can define three prioritization strategies: guaranteed bandwidth, maximum bandwidth, and priority.

For each shaping profile, a default shaping class must be defined. Traffic is prioritized based on the default shaping group in the following two circumstances:

- All traffic to the outgoing interface that does not match to any shaping policy
- Traffic with a shaping group that is not defined in a shaping profile

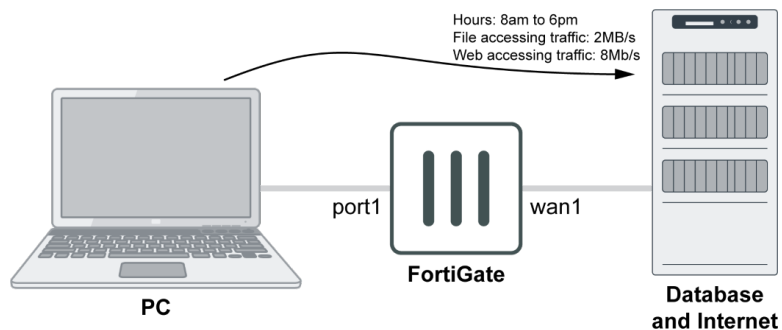

Prioritization strategy	Description
Guaranteed bandwidth	The percentage of the link speed that is reserved for the shaping group. The total guaranteed bandwidth for all shaping groups cannot exceed 100%.
Maximum bandwidth	The maximum percentage of the link speed that the shaping group can use.
Priority	The shaping class priority: top, critical, high, medium, or low. When groups are competing for bandwidth on the interface, the group with the higher priority wins.

Applying a shaping profile to an interface

Traffic shaping is accomplished by configuring the outgoing bandwidth and outgoing shaping profile on an interface. The shaping profile uses the outgoing bandwidth of the interface as the maximum link speed, and it only works when the outgoing bandwidth is configured.

This example shows how to apply interface-based traffic shaping to web and file accessing traffic according to a schedule:

- The link speed of the wan1 interface is 10 Mb/s.
- File access can use up to 2 Mb/s from 8:00 AM to 6:00 PM.
- Web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

Putting the traffic into shaping classes

To create a recurring schedule in the GUI:

1. Go to *Policy & Objects > Schedules*.
2. Click *Create New > Schedule*.
3. Configure a recurring schedule called *Day_Hours* for everyday from 8:00 AM to 6:00 PM.
4. Click *OK*.

To create a traffic shaping policy and class ID for the web accessing traffic in the GUI:

1. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
2. Enter a name for the policy, such as *web_access_day_hours*.
3. Enable *Schedule* and select the schedule you just created.
4. Set *Service* to web accessing services, such as *HTTP* and *HTTPS*.
5. Set *Action* to *Assign Shaping Class ID*, and *Outgoing interface* to *wan1*.
6. Click the *Traffic shaping class ID* drop down then click *Create*.

7. Enter an integer value for the *ID* (3) and a description for the *Name*, such as *Web Access*.
8. Click **OK**.
9. Select the class ID you just created for *Traffic shaping class ID*.

10. Configure the remaining settings as required.
11. Click **OK**.

To create a traffic shaping policy and class ID for the file accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
2. Enter a name for the policy, such as *file_access_day_hours*.
3. Enable *Schedule* and select the schedule you just created.
4. Set *Service* to file accessing services, such as *ASF3*, *FTP* and *SMB*.
5. Set *Action* to *Assign Shaping Class ID*, and *Outgoing interface* to *wan1*.
6. Click the *Traffic shaping class ID* drop down then click *Create*.
7. Enter an integer value for the *ID* (4) and a description for the *Name*, such as *File Access*.
8. Click **OK**.

9. Select the class ID you just created for *Traffic shaping class ID*.

10. Configure the remaining settings as required.

11. Click OK.

To put the traffic into shaping classes in the CLI:

1. Create a recurring schedule:

```
config firewall schedule recurring
    edit "Day_Hours"
        set start 08:00
        set end 18:00
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

2. Create the traffic class IDs:

```
config firewall traffic-class
    edit 3
        set class-name "Web Access"
    next
    edit 4
        set class-name "File Access"
    next
end
```

3. Create the web and file accessing traffic shaping policies:

```
config firewall shaping-policy
edit 2
    set name "web_access_day_hours"
    set comment "Limit web accessing traffic to 8Mb/s in day time"
    set service "HTTP" "HTTPS"
    set schedule "Day_Hours"
    set dstintf "wan1"
    set class-id 3
    set srcaddr "all"
    set dstaddr "all"
next
edit 3
    set name "file_access_day_hours"
    set comment "Limit file accessing traffic to 2Mb/s during the day"
    set service "AFS3" "FTP" "FTP_GET" "FTP_PUT" "NFS" "SAMBA" "SMB" "TFTP"
    set schedule "Day_Hours"
    set dstintf "wan1"
    set class-id 4
    set srcaddr "all"
    set dstaddr "all"
next
end
```

Allocating bandwidth to the shaping classes

A traffic shaping profile defines the guaranteed and maximum bandwidths each class receives. In this example, file access can use up to 2 Mb/s and web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

To create a traffic shaping profile using the GUI:

1. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Profiles* tab, and click *Create New*.
2. Enter a name for the profile, such as *Day_Hours_Profile*.
3. Configure a default traffic shaping class:

This class has a high priority, meaning that when the other classes have reached their guaranteed bandwidths, this default class will use the rest of the available bandwidth.

 - a. In the *Traffic Shaping Classes* table click *Create New*.
 - b. Click the *Traffic shaping class ID* drop down then click *Create*.
 - c. Enter a name for the class, such as *Default Access*.
 - d. Click *OK*.
 - e. Select the class ID you just created for *Traffic shaping class ID*.

- f. Configure the following settings, then click **OK**:

Guaranteed bandwidth	30
Maximum bandwidth	100
Priority	High

4. Configure a web accessing traffic shaping class:

When other types of traffic are competing for bandwidth, this class is guaranteed to 6 Mb/s, or 60% of the bandwidth.

- a. In the *Traffic Shaping Classes* table click *Create New*.
- b. Configure the following settings, then click **OK**:

Traffic shaping class ID	Web Access
Guaranteed bandwidth	60
Maximum bandwidth	80
Priority	Medium

5. Configure a file accessing traffic shaping class:

When other types of traffic are competing for bandwidth, this group is guaranteed to 1 Mb/s, or 10% of the bandwidth.

- a. In the *Traffic Shaping Classes* table click *Create New*.
- b. Configure the following settings, then click **OK**:

Traffic shaping class ID	File Access
Guaranteed bandwidth	10
Maximum bandwidth	20
Priority	Medium

6. Click OK.

To create a traffic shaping profile using the CLI:

```
config firewall shaping-profile
  edit "Day_Hours_Profile"
    set default-class-id 2
    config shaping-entries
      edit 1
        set class-id 2
        set guaranteed-bandwidth-percentage 30
        set maximum-bandwidth-percentage 100
      next
      edit 2
        set class-id 3
        set priority medium
        set guaranteed-bandwidth-percentage 60
        set maximum-bandwidth-percentage 80
      next
      edit 3
        set class-id 4
```

```

        set priority medium
        set guaranteed-bandwidth-percentage 10
        set maximum-bandwidth-percentage 20
    next
end
next
end

```

Defining the available bandwidth on an interface

In this example, the link speed of the wan1 interface is 10 Mb/s.

To set the bandwidth of the wan1 interface in the GUI:

1. Go to *Network > Interfaces*.
2. Edit the wan1 interface.
3. Under Traffic Shaping, enable *Outbound shaping profile* and select the profile that you just created, *Day_Hours_Profile*.
4. Enable *Outbound Bandwidth* and set it to *10000 Kbps*.

The screenshot shows the 'Edit Interface' window for the 'wan1' interface. The 'Network' tab is active. Under 'Traffic Shaping', 'Outbound shaping profile' is set to 'Day_Hours_Profile' and 'Outbound bandwidth' is set to '10000 kbps'. The 'Status' is 'Enabled'. The 'Miscellaneous' section shows a 'Comments' field and a 'Status' toggle set to 'Enabled'. The 'Additional Information' section on the right includes links for 'API Preview', 'References', 'Edit in CLI', 'Documentation', 'Online Help', and 'Video Tutorials'.

5. Click **OK**.

To set the bandwidth of the wan1 interface in the CLI:

```

config system interface
    edit "wan1"
        set egress-shaping-profile "Day_Hours_Profile"
        set outbandwidth 10000
    next
end

```

Diagnose commands

To check that the specific traffic is put into the correct shaping group or class ID:

```
# diagnose firewall iprope list 100015
```

To check the speed limit for each class ID on an interface:

```
# diagnose netlink interface list wan1
```

Interface-based traffic shaping with NP acceleration

Interface-based traffic shaping with NP acceleration is supported on some devices.

An administrator configures the WAN interface's maximum outbound bandwidth and, based on that, creates a traffic shaping profile with a percentage based shaper. This allows for proper QoS and traffic shaping. VLAN interfaces are not supported.

This feature is supported on FortiGate 600E, 500E, and 300E models.

To configure interface-based traffic shaping:

1. Enable NPU offloading when doing interface-based traffic shaping according to the egress-shaping-profile:

```
config system npu
    set intf-shaping-offload enable
end
```

2. Configure shaping profiles:

```
config firewall shaping-profile
    edit "sdwan"
        set default-class-id 4
        config shaping-entries
            edit 1
                set class-id 4
                set guaranteed-bandwidth-percentage 3
                set maximum-bandwidth-percentage 5
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 50
                set maximum-bandwidth-percentage 100
            next
            edit 3
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 1
                set maximum-bandwidth-percentage 5
            next
        end
    next
end
```

The class number is limited to 16.

3. Configure a traffic shaper and shaping policy:

```
config firewall shaper traffic-shaper
    edit "Transactional"
        set priority medium
    next
end

config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "any"
        set traffic-shaper "Transactional"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Apply the egress shaping profile on the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.1.100.23 255.255.255.0
        set allowaccess ping
        set type physical
        set outbandwidth 500
        set egress-shaping-profile "sdwan"
        set snmp-index 4
    next
end
```

5. Configure a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

QoS assignment and rate limiting for FortiSwitch quarantined VLANs

When devices are quarantined, they are isolated from the rest of the network. However, they can still impact the network if not controlled beyond isolation. A quarantined host, which offers heavy traffic, could congest the network and create a DOS-style reduction in service to authorized hosts.

Within the quarantined VLAN, two restrictions are available within the network:

- Traffic policing (also known as rate limiting)
- QoS (Quality of Service) assignment (also known as priority assignment)

Each quarantined host's traffic can be subject to rate limiting and priority adjustment. This reduces the impact that any quarantined host can have on authorized traffic on the network.

To configure QoS assignment and rate limiting for quarantined VLANs:

1. Configure a traffic policy, or use the default "quarantine" policy:

```
config switch-controller traffic-policy
  edit "quarantine"
    set description "Rate control for quarantined traffic"
    set guaranteed-bandwidth 163840
    set guaranteed-burst 8192
    set maximum-burst 163840
    set cos-queue 0
  next
end
```

2. Configure an interface:

```
config system interface
  edit "qtn.aggr1"
    set vdom "root"
    set ip 10.254.254.254 255.255.255.0
    set description "Quarantine VLAN"
    set security-mode captive-portal
    set replacemsg-override-group "auth-intf-qtn.aggr1"
    set device-identification enable
    set snmp-index 30
    set switch-controller-access-vlan enable
    set switch-controller-traffic-policy "quarantine"
    set color 6
    set interface "aggr1"
    set vlanid 4093
  next
end
```

By default, switch-controller-traffic-policy is empty. You need to apply the necessary traffic policy (not only limited to "quarantine").

Ingress traffic shaping profile

A traffic shaping profile can be applied to an interface for traffic in the ingress direction. Similar to an egress traffic shaping profile, the guaranteed bandwidth and priority of the profile will be respected when an interface receives inbound traffic. When congestion occurs, any remaining bandwidth will be allotted to classes based on priority.

Ingress traffic shaping does not support NPU offloading.

Example

In this example, the port2 interface has a total inbound bandwidth of 100 Mbps. Traffic from certain clients to certain servers are assigned different classes.

IPv6 traffic from any client PCs to server PCs is assigned class 5.

For each class, the priority, guaranteed bandwidth, and maximum bandwidth are as follows:

Class	Priority	Guaranteed bandwidth	Maximum bandwidth
2	Low	10%	60%
3	High	20%	100%
4	High	30%	100%
5	Medium	10%	50%

Bandwidth will first be allotted to each class according to its guaranteed bandwidth. Then remaining available bandwidth will be allotted to class 3 and 4 first based on their priority. The allocation will be proportional to their guaranteed bandwidth ratio.

To configure ingress traffic shaping:

1. Configure the client and server addresses:

```
config firewall address
  edit "pc1"
    set subnet 10.1.100.11 255.255.255.255
  next
  edit "pc2"
    set subnet 10.1.100.22 255.255.255.255
  next
  edit "pc4"
    set subnet 172.16.200.44 255.255.255.255
  next
  edit "pc5"
    set subnet 172.16.200.55 255.255.255.255
  next
end
```

2. Configure the class IDs:

```
config firewall traffic-class
  edit 2
    set class-name "class2"
  next
  edit 3
    set class-name "class3"
  next
  edit 4
    set class-name "class4"
  next
  edit 4
    set class-name "class5"
  next
end
```

3. Configure traffic shaping policies to assign classes to each group of traffic.**a. Configure a policy to assign traffic from PC1 to PC4 in class 2:**

```
config firewall shaping-policy
  edit 1
    set name "shaping policy 1"
    set service "ALL"
    set dstintf "wan1"
    set class-id 2
    set srcaddr "pc1"
    set dstaddr "pc4"
  next
end
```

b. Configure a policy to assign traffic from PC2 to PC4 in class 3:

```
config firewall shaping-policy
  edit 2
    set name "shaping policy 2"
    set service "ALL"
    set dstintf "wan1"
    set class-id 3
    set srcaddr "pc2"
    set dstaddr "pc4"
  next
end
```

c. Configure a policy to assign traffic from PC2 to PC5 in class 4:

```
config firewall shaping-policy
  edit 3
    set name "shaping policy 3"
    set service "ALL"
    set dstintf "wan1"
    set class-id 4
    set srcaddr "pc2"
    set dstaddr "pc5"
  next
end
```

d. Configure a policy to assign all IPv6 traffic to class 5:

```
config firewall shaping-policy
  edit 4
    set name "shaping policy 4"
    set ip-version 6
    set service "ALL"
    set dstintf "wan1"
    set class-id 5
    set srcaddr6 "all"
    set dstaddr6 "all"
  next
end
```

4. Configure a shaping profile to set the priority, and the guaranteed and maximum bandwidth percentages for each class:

```
config firewall shaping-profile
  edit "ingShapeProfile"
    set default-class-id 2
    config shaping-entries
      edit 2
        set class-id 2
        set priority low
        set guaranteed-bandwidth-percentage 10
        set maximum-bandwidth-percentage 60
      next
      edit 3
        set class-id 3
        set guaranteed-bandwidth-percentage 20
        set maximum-bandwidth-percentage 100
      next
      edit 4
        set class-id 4
        set guaranteed-bandwidth-percentage 30
        set maximum-bandwidth-percentage 100
      next
      edit 5
        set class-id 5
        set priority medium
        set guaranteed-bandwidth-percentage 10
        set maximum-bandwidth-percentage 50
      next
    end
  next
end
```

5. Configure the inbandwidth and apply the ingress shaping profile on port2:

```
config system interface
  edit "port2"
    set ip 10.1.100.1 255.255.255.0
    set inbandwidth 100000
    set ingress-shaping-profile "ingShapeProfile"
  config ipv6
    set ip6-address 2000:10:1:100::1/64
  end
```

```

    next
end

```

Inbandwidth must be configured for traffic shaping to take effect.

6. Configure a firewall policy to allow traffic to go through. Since traffic shaping is for inbound traffic on port2, the policy is defined from port2 to wan1:

```

config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end

```

NPU must be disabled by configuring `set auto-asic-offload disable`.

Verifying that the traffic is being shaped

In each of the following cases, the server PCs (PC4 and PC5) are configured as iPerf servers. The client PCs (PC1 and PC2) are configured as iPerf clients. The client sends traffic to the server from the client to server direction, triggering inbound traffic shaping on the port2 interface. The inbound bandwidth on port2 is 100 Mbps.

Case 1: single stream, PC1 to PC4

Traffic is sent from PC1 to PC4. There is no other traffic. Traffic is marked with class ID 2 and allocated the maximum bandwidth 60 Mbps (60%).

```

# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0

misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=25

```

Case 2: dual stream, PC1 to PC4, PC2 to PC4

Traffic is sent from both PC1 and PC2 to PC4. PC1 to PC4 traffic is marked with class ID 2 and low priority, and PC2 to PC4 traffic is marked with class ID 3 and high priority. Both class 2 and 3 will be allocated their guaranteed bandwidth first, using up 10% and 20% respectively. The remaining available bandwidth is used by class 3 since it has a higher priority. Class 2 uses around 10 Mbps, and class 3 uses around 90 Mbps.

```

# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run multicast

misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36

```

Case 3: multiple streams

Multiple streams of traffic are sent at the same time:

- PC1 to PC4 traffic is assigned class 2 with low priority, and a guaranteed bandwidth of 10 Mbps.
- PC2 to PC4 traffic is assigned class 3 with high priority, and a guaranteed bandwidth of 20 Mbps.
- PC2 to PC5 traffic is assigned class 4 with high priority, and a guaranteed bandwidth of 30 Mbps.

All classes will be allocated their guaranteed bandwidth first, using up 10 Mbps, 20 Mbps, and 30 Mbps respectively. The remaining available bandwidth (40 Mbps) is shared by class 3 and class 4 based on their guaranteed bandwidth ratio of 20:30.

- Class 3's share of the remaining 40 Mbps traffic = $40 \times 20 / (20 + 30) = 16$ Mbps
- Class 4's share of the remaining 40 Mbps traffic = $40 \times 30 / (20 + 30) = 24$ Mbps

Each class is allocated roughly the following bandwidth:

- Class 2: 10 Mbps
- Class 3: 20 Mbps + 16 Mbps = 36 Mbps
- Class 4: 30 Mbps + 24 Mbps = 54 Mbps

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=27 state=start present fw_flags=3800 flags=up broadcast run multicast

Internet Services

The following topics provide instructions on configuring policies with Internet Service:

- [Using Internet Service in a policy on page 1403](#)
- [Using custom Internet Service in policy on page 1407](#)
- [Using extension Internet Service in policy on page 1408](#)
- [Global IP address information database on page 1411](#)
- [IP reputation filtering on page 1413](#)
- [Internet service groups in policies on page 1414](#)
- [Allow creation of ISDB objects with regional information on page 1418](#)
- [Internet service customization on page 1420](#)
- [Look up IP address information from the Internet Service Database page on page 1421](#)
- [Internet Service Database on-demand mode on page 1422](#)

Using Internet Service in a policy

This topic shows how to apply a predefined Internet Service entry into a policy.

The Internet Service Database is a comprehensive public IP address database that combines IP address range, IP owner, service port number, and IP security credibility. The data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

From FortiOS version 5.6, Internet Service is included in the firewall policy. It can be applied to a policy only as a destination object. From version 6.0, Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.

There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

Sample IPv4 configuration

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Click in the *Destination* field.
3. In the *Select Entries* pane, click *Internet Service* and select *Google-Gmail*.

4. Configure the remaining fields as needed.
5. Click **OK**.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

```
config firewall policy
  edit 9
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "g-default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

To diagnose an Internet Service entry in the CLI:

```
# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
Singularity: 15
Reputation: 5(Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53(gmail.com)
Direction: dst
Data source: isdb
```

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Sample IPv6 configuration

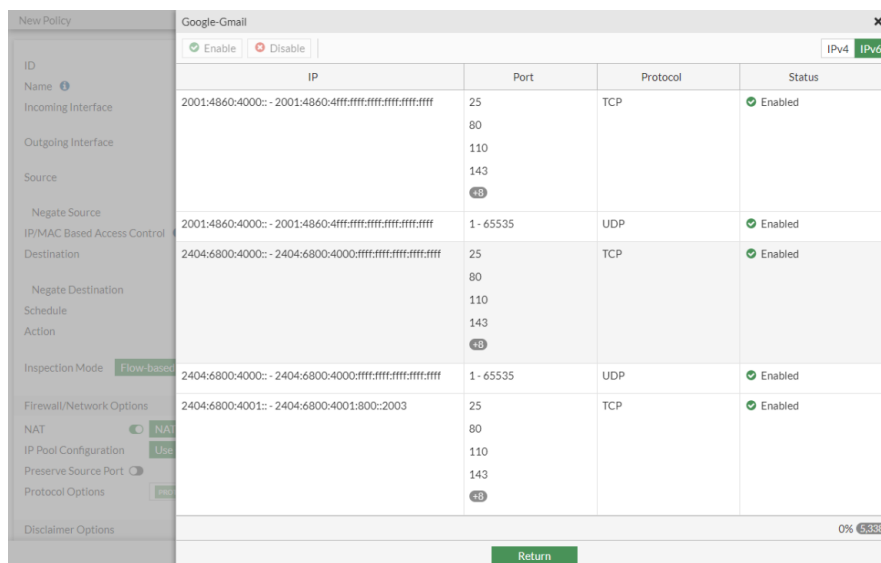

In this example, the Google Gmail IPv6 ISDB address (ID 65646) is used as a destination in a firewall policy.

To apply a predefined IPv6 Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. In the *Destination* field, click the + and select the *Internet Service* tab.
3. In the *IPV6 INTERNET SERVICE* section, select *Google Gmail*.

4. Optionally, hover over the *Google Gmail* and click *View/Edit Entries*. A pane appears that displays the IPv6 address ranges for this Internet Service.

5. Click *Return* to close the pane.
6. Configure the other settings as needed.
7. Click *OK*.

To apply a predefined IPv6 Internet Service entry to a policy using the CLI:

```

config firewall policy
    edit 4
        set name "Internet Service6 policy"
        set srcintf "vlan100"
        set dstintf "wan1"
        set action accept
        set srcaddr6 "all"
        set internet-service6 enable
        set internet-service6-name "Google-Gmail"
        set schedule "always"
        set nat enable
    next
end

```

To diagnose an IPv6 Internet Service entry in the CLI:

```

# diagnose internet-service6 id-summary 65646

Version: 00007.02907
Timestamp: 202212161345
Total number of IP ranges: 36878
Number of Groups: 12
Group(0), Singularity(20), Number of IP ranges(60)
Group(1), Singularity(18), Number of IP ranges(12)
Group(2), Singularity(17), Number of IP ranges(2728)
Group(3), Singularity(16), Number of IP ranges(2812)
Group(4), Singularity(15), Number of IP ranges(4011)
Group(5), Singularity(10), Number of IP ranges(2345)
Group(6), Singularity(9), Number of IP ranges(14)
Group(7), Singularity(8), Number of IP ranges(1555)
Group(8), Singularity(7), Number of IP ranges(2704)
Group(9), Singularity(6), Number of IP ranges(7300)
Group(10), Singularity(5), Number of IP ranges(3154)
Group(11), Singularity(4), Number of IP ranges(10183)
Internet Service: 65646(Google-Gmail)
Number of IP ranges: 482
Singularity: 15
Icon Id: 510
Direction: both
Data source: isdb
Country: 32 36 56 76 124 152 158 203 208 246 250 276 344 348 356 372 376 380 392 404 458 484
        528 616 634 643 682 702 710 724 752 756 784 826 840
Region: 65535
City: 65535

```

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see [Allow creation of ISDB objects with regional information on page 1418](#)).

CLI syntax

```
config firewall internet-service-custom
  edit <name>
    set comment <comment>
    set reputation {1 | 2 | 3 | 4 | 5}
    config entry
      edit <ID>
        set protocol <protocol #>
        set dst <object_name>
        config port-range
          edit <ID>
            set start-port <port #>
            set end-port <port #>
          next
        end
      next
    end
  end
end
```

Sample configuration

To configure a custom Internet Service:

```
config firewall internet-service-custom
  edit "test-isdb-1"
    set comment "Test Custom Internet Service"
    set reputation 4
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
            set start-port 80
            set end-port 443
          next
        end
      set dst "10-1-100-0"
```

```
        next
        edit 2
            set protocol 6
            config port-range
                edit 1
                    set start-port 80
                    set end-port 80
                next
            end
            set dst "172-16-200-0"
        next
    end
next
end
```

To apply a custom Internet Service into a policy:

```
config firewall policy
    edit 1
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set internet-service-custom "test-isdb-1"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

Using extension Internet Service in policy

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

Custom extension Internet Service CLI syntax

```

config firewall internet-service-extension
  edit <ID #>
    set comment <comment>
    config entry
      edit <ID #>
        set protocol <number #>
        set dst <object_name>
        config port-range
          edit <ID #>
            set start-port <number #>
            set end-port <number #>
          next
        end
      next
    end
  next
end
end
end

```

Sample configuration

To configure an extension Internet Service in the CLI:

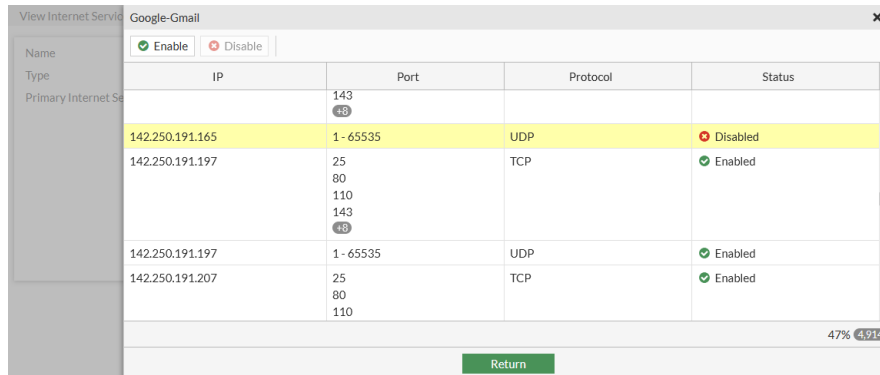

```

config firewall internet-service-extension
  edit 65646
    set comment "Test Extension Internet Service 65646"
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
            set start-port 80
            set end-port 443
          next
        end
        set dst "172-16-200-0"
      next
      edit 2
        set protocol 17
        config port-range
          edit 1
            set start-port 53
            set end-port 53
          next
        end
        set dst "10-1-100-0"
      next
    end
  next
end
end
end

```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to *Policy & Objects > Internet Service Database*.
2. Search for *Google-Gmail*.
3. Select *Google-Gmail* and click *Edit*.
4. In the gutter, click *View/Edit Entries*.
5. Select the *IP* entry that you need to remove and click *Disable*.

6. Click *Return* twice.

To remove IP address and port entries from an existing Internet Service in the CLI:

```
config firewall internet-service-extension
  edit 65646
    config disable-entry
      edit 1
        set protocol 17
        config port-range
          edit 1
            next
          end
        config ip-range
          edit 1
            set start-ip 142.250.191.165
            set end-ip 142.250.191.165
          next
        end
      next
    end
  next
end
next
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
  edit 9
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
```

```
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

Global IP address information database

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.

The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

```
(global) # get firewall internet-service-owner ?
id      Internet Service owner ID.
1  Google
2  Facebook
3  Apple
4  Yahoo
5  Microsoft
.....
115  Cybozu
116  VNC
```

To check for any known service running on an IP address:

```
(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8
Internet Service: 65537(Google.Web)
```

To check GeoIP location and blocklist information:

```
(global) # diagnose internet-service id 65537 | grep 8.8.8.8
8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)
8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)
```

To check a known malicious server:

```
(global) # diagnose internet-service id-summary 3080383
Version: 0000600096
Timestamp: 201902111802
```

```
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

1	Known malicious sites, such as phishing sites or sites related to botnet servers
2	High risk services sites, such as TOR, proxy, and P2P
3	Unverified sites
4	Reputable social media sites, such as Facebook and Twitter
5	Known and verified safe sites, such as Gmail, Amazon, and eBay

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is `destination`.

Example 1

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

To set the reputation level and direction in a policy using the CLI:

```

config firewall policy
  edit 1
    set srcintf "wan2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set reputation-minimum 3
    set reputation-direction source
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set auto-asic-offload disable

```

```
        set nat enable
    next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

Example 2

This policy allows only outbound FTP traffic, if the destination server has a minimum reputation of 4.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set reputation-minimum 4
        set reputation-direction destination
        set action accept
        set schedule "always"
        set service "FTP"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service groups in policies

This feature provides support for Internet Service Groups in traffic shaping and firewall policies. Service groups can be used as the source and destination of the policy. Internet Service Groups are used as criteria to match traffic; the shaper will be applied when the traffic matches.

To use a group as a destination, `internet-service` must be enabled. To use a group as a source, `internet-service-src` must be enabled.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

Variable	Description
<code>internet-service-group <string></code>	Internet Service group name.
<code>internet-service-custom-group <string></code>	Custom Internet Service group name.
<code>internet-service-src-group <string></code>	Internet Service source group name.
<code>internet-service-src-custom-group <string></code>	Custom Internet Service source group name.

Examples

The following examples use the below topology.

Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an Internet Service Group.

To configure access to Google services using an Internet Service Group using the CLI:

1. Create a Service Group:

```

config firewall internet-service-group
    edit "Google_Group"
        set direction destination
        set member Google-Other Google-Web Google-ICMP Google-DNS Google-Outbound_Email
        Google-SSH Google-FTP Google-NTP Google-Inbound_Email Google-LDAP Google-
        NetBIOS.Session.Service Google-RTMP Google-NetBIOS.Name.Service Google-Google.Cloud
        Google-Gmail
    next
end
  
```

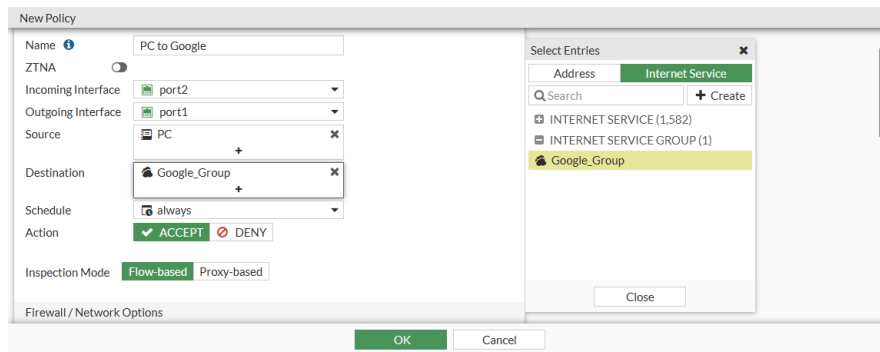

2. Create a firewall policy to allow access to all Google Services from the PC:

```

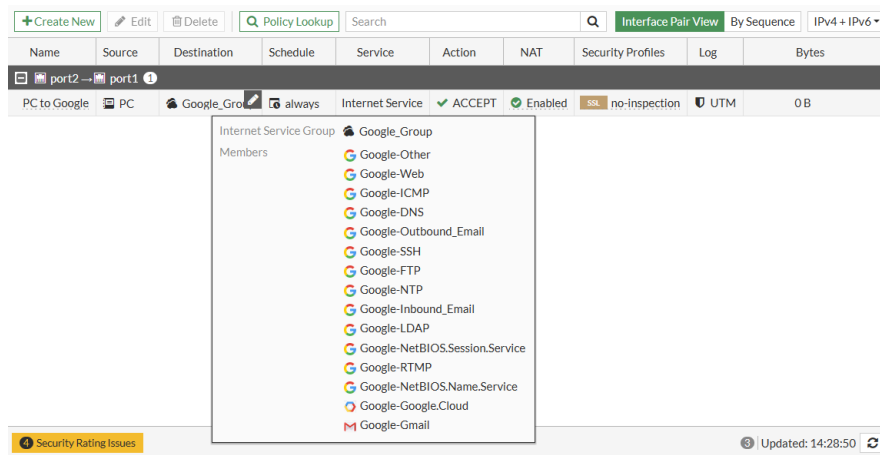

config firewall policy
    edit 1
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-group "Google_Group"
        set action accept
        set schedule "always"
        set fsso disable
        set nat enable
    next
end
  
```

To configure access to Google services using an Internet Service Group in the GUI:

1. On the FortiGate, create a Service Group using the CLI.
2. Go to *Policy & Objects > Firewall Policy*, and create a new policy.
3. Set the *Destination* as the just created Internet Service Group.

4. Configure the remaining options, then click **OK**.
5. Go to **Policy & Objects > Firewall Policy** and hover over the group to view a list of its members.

Example 2

In this example, two office FTP servers are put into an Internet Custom Service Group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom service group and limit the PC connection speed to them in the CLI:

1. Create custom internet services for the internal FTP servers:

```
config firewall internet-service-custom
  edit "FTP_PM"
    config entry
      edit 1
        config port-range
          edit 1
            set start-port 21
            set end-port 21
          next
        end
        set dst "PM_Server"
      next
    end
  next
end
```

```
edit "FTP_QA"
  config entry
    edit 1
      config port-range
        edit 1
          set start-port 21
          set end-port 21
        next
      end
      set dst "QA_Server"
    next
  end
next
end
```

2. Create a custom internet server group and add the just created custom internet services to it:

```
config firewall internet-service-custom-group
  edit "Internal_FTP"
    set member "FTP_QA" "FTP_PM"
  next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:

```
config firewall shaper traffic-shaper
  edit "Internal_FTP_Limit_1Mbps"
    set guaranteed-bandwidth 500
    set maximum-bandwidth 1000
    set priority medium
  next
end
```

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```
config firewall shaping-policy
  edit 1
    set name "For Internal FTP"
    set internet-service enable
    set internet-service-custom-group "Internal_FTP"
    set dstintf "port1"
    set traffic-shaper "Internal_FTP_Limit_1Mbps"
    set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
    set srcaddr "PC"
  next
end
```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
 - b. Enter a *Name* for the shaper, such as *Internal_FTP_Limit_1Mbps*.
 - c. Set the *Traffic Priority* to *Medium*.
 - d. Enable *Max Bandwidth* and set it to *1000*.

- e. Enable *Guaranteed Bandwidth* and set it to 500.
 - f. Click OK.
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
 - b. Set the *Destination* to the just created custom internet service group, and apply the just create traffic shaper.

- c. Configure the remaining options as shown, then click OK.

Allow creation of ISDB objects with regional information

Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:

1. Create the ISDB object:
 - a. Go to *Policy & Objects > Internet Service Database* and click *Create New > Geographic Based Internet Service*.
 - b. Configure the settings as required.

- c. Click OK.
2. View the IP ranges in the location-based internet service:
 - a. Go to *Policy & Objects > Internet Service Database*.
 - b. In the table, hover over the object created in step 1 and click *View/Edit Entries*. The list of IPs is displayed:

IP	Port	Protocol	Status
104.132.190.0 - 104.132.190.255	1 - 65535	TCP	Enabled
104.132.190.0 - 104.132.190.255	1 - 65535	UDP	Enabled
104.133.8.0 - 104.133.9.255	1 - 65535	TCP	Enabled
104.133.8.0 - 104.133.9.255	1 - 65535	UDP	Enabled
104.133.83.0 - 104.133.83.255	1 - 65535	TCP	Enabled
104.133.83.0 - 104.133.83.255	1 - 65535	UDP	Enabled

c. Click *Return*.

3. Add the ISDB object to a policy:

- Go to *Policy & Objects > Firewall Policy* and create a new policy or edit an existing one.
- For *Destination*, click *Internet Service* and select the ISDB object created in step 1.
- Configure the other settings as needed.

d. Click *OK*.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
  edit "test-location-isdb-1"
    set type location
    set internet-service-id 65536
    set country-id 840
    set region-id 283
    set city-id 23352
  next
end
```

2. View the IP ranges in the location-based internet service:

```
# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(17) port(1-65535)
```

3. Add the ISDB object to a policy:

```

config firewall policy
  edit 3
    set name "PC to Google"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "PC"
    set internet-service enable
    set internet-service-name "test-location-isdb-1"
    set action accept
    set schedule "always"
    set logtraffic all
    set logtraffic-start enable
    set auto-asic-offload disable
    set nat enable
  next
end

```

Internet service customization

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

If you are in multi-VDOM mode, Internet service customization can only occur at the Global level and not in a VDOM. See [VDOM overview on page 2475](#) for more information.

To add a custom port range:

```

config firewall internet-service-addition
  edit 65646
    set comment "Add custom port-range:tcp/8080-8090 into 65646"
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
            set start-port 8080
            set end-port 8090
          next
        end
      next
    end
  next
end

```

Warning: Configuration will only be applied after rebooting or using the 'execute internet-service refresh' command.

To verify that the change was applied:

```

# diagnose internet-service info FG-traffic 6 8080 2.20.183.160
Internet Service: 65646(Google.Gmail)

```

To configure additional port mapping:

```
config firewall internet-service-append
    set match-port 10
    set append-port 20
end
```

Warning: Configuration will only be applied after rebooting or using the 'execute internet-service refresh' command.

Look up IP address information from the Internet Service Database page

The *IP Address Lookup* button allows users to look up IP address information from the Internet Service Database and GeoIP Database. Returned IP address information includes the reverse IP address/domain lookup, location, reputation, and other internet service information.

To look up IP address information:

1. Go to *Policy & Objects > Internet Service Database*.
2. Click *IP Address Lookup*. The *IP Address Lookup* pane opens.
3. In the *IP Address Query* field, enter the IP address and press *Enter*.

Results of an IP address from the Internet Service Database:

The screenshot shows the 'IP Address Lookup' window. At the top, there's a search bar labeled 'IP Address Query' with the value '8.8.8.8'. Below this, the 'IP Address Details' section lists the following information:

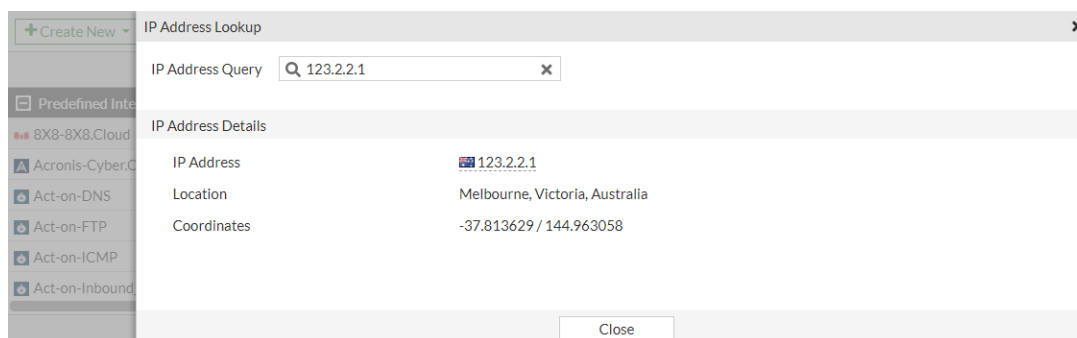

- IP Address:** 8.8.8.8
- Owner:** Google
- Location:** Mountain View, California, United States
- Coordinates:** 37.386051 / -122.083847
- Reputation:** Unverified site
- Popularity:** ★★★★★

Below the details is the 'Internet Service Details' table:

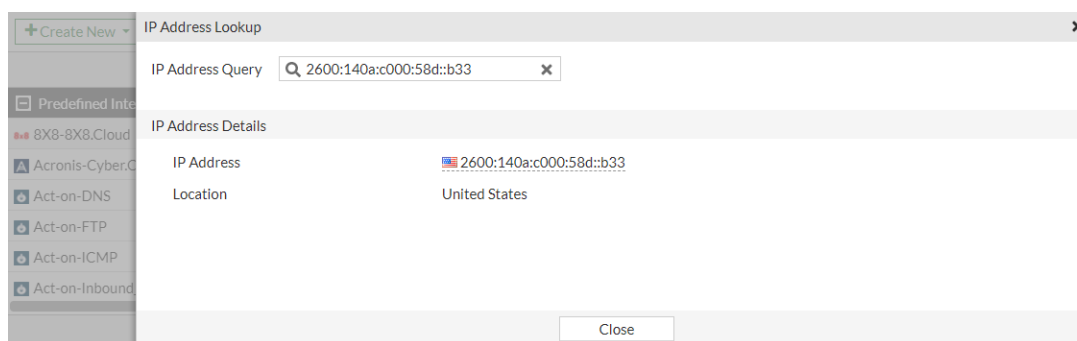

ID	Reputation	Popularity
DNS-DoH_DoT	Unverified site	★★★★☆
Google-Web	Reputable site from social media	★★★★★
Google-ICMP		
Google-DNS		
Google-Outbound_Email		
Google-SSH		

A 'Close' button is located at the bottom right of the window.

Results of an IP address from the GeoIP Database:

Results of an IPv6 address from the GeoIP Database:

4. Click *Close*.

Internet Service Database on-demand mode

Internet Service Database (ISDB) on-demand mode replaces the full-sized ISDB file with a much smaller file that is downloaded onto the flash drive. This file contains only the essential entries for Internet Services. When a service is used in a firewall policy, the FortiGate queries FortiGuard to download the IP addresses and stores them on the flash drive. The FortiGate also queries the local MAC Database (MADB) for corresponding MAC information. The content of the ISDB entries used in firewall policies persists through reboots.

To enable ISDB (FFDB) on-demand mode:

1. Configure the global setting:

```
config system global
    set internet-service-database on-demand
end
```

All FFDB files are erased.

2. Verify that there are no ISDB (FFDB) files:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
-----
Version: 0.00000
Contract Expiry Date: n/a
Last Updated using manual update on Mon Jan  1 00:00:00 2001
Last Update Attempt: n/a
Result: Updates Installed
```

Shortly after, the ISDB (FFDB) data structure is downloaded on the FortiGate. The following message appears in the debug messages:

```
do_ffsr_update[1567]-Starting  Update FFDB ondemand:(not final retry)
```

3. Run diagnostics again to verify that the ISDB (FFDB) files are saved on the FortiGate flash drive:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
-----
Version: 7.02950
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan  6 06:45:00 2023
Last Update Attempt: n/a
Result: Updates Installed
```

4. Since no services have been applied to a policy, the IP range and IP address values are blank in the the summary details. For example, check the summary details for ID 1245187, Fortinet DNS:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02950
Timestamp: 202301060645
Total number of IP ranges: 3085
Number of Groups: 1
Group(0), Singularity(90), Number of IP ranges(3085)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 0
Number of IP addresses: 0
Singularity: 0
Icon Id: 19
Direction: dst
Data source: isdb
Country:
Region:
City:
```

5. Apply the Fortinet DNS service in a firewall policy:

```
config firewall policy
  edit 1
    set name "FDNS"
    set srcintf "port1"
    set dstintf "wan1"
    set action accept
    set srcaddr "all"
    set internet-service enable
    set internet-service-name "Fortinet-DNS"
    set schedule "always"
    set nat enable
  next
end
```

6. Verify the summary details again for ID 1245187 (Fortinet DNS). There is now data for the IP range and IP address values:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02951
Timestamp: 202301061144
Total number of IP ranges: 3558
```

```
Number of Groups: 2
Group(0), Singularity(90), Number of IP ranges(3078)
Group(1), Singularity(10), Number of IP ranges(480)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 480
Number of IP addresses: 55242
Singularity: 10
Icon Id: 19
Direction: dst
Data source: isdb
Country: 12 32 36 40 56 124 158 170 203 222 250 276 320 332 344 356 360 372 380 392 458

If you are unable to view a security profile feature, go to *System > Feature Visibility* to enable it.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

Certain unused WAD proxy processes are not started by default on FortiGate models with 2 GB of RAM or less to reduce memory usage. These process will only start when relevant proxy features are configured, such as explicit proxies, transparent proxies, or ZTNA.

This following topics provide information about inspection modes for various security profile features:

- [Flow mode inspection \(default mode\) on page 1426](#)
- [Proxy mode inspection on page 1426](#)
- [Inspection mode feature comparison on page 1428](#)

Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection, and prevents the payload from being sent successfully.

Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked.

Use case

It is recommended to apply flow inspection to policies that prioritize traffic throughput, such as allowing connections to a streaming or file server.

For example, you have an application server that accepts connections from users for a daily quiz show app, HQ. Each HQ session sees 500,000+ participants, and speed is very important because participants have less than 10 seconds to answer the quiz show questions.

In this scenario, a flow inspection policy is recommended to prioritize throughput. The success of the application depends on providing reliable service for large numbers of concurrent users. The policy would include an IPS sensor to protect the server from external DOS attacks.

Proxy mode inspection

When a firewall policy's inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the

entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

Proxy mode provides the most thorough inspection of the traffic; however, its thoroughness sacrifices performance, making its throughput slower than that of a flow mode policy. Under normal traffic circumstances, the throughput difference between a proxy-based and flow-based policy is not significant.

Use case 1

Your organization deals with sensitive data on a regular basis and a data leak would significantly harm your business. At the same time, you wish to protect your employees from malicious content, such as viruses and phishing emails, which could be used to gain access to your network and the sensitive data on your systems.

In this scenario, a proxy inspection policy is recommended to prioritize network security. You want traffic inspection to be as thorough as possible to avoid any data leaks from exiting the LAN and any malicious content from entering it. The policy would include antivirus, DLP, web, and email filters all operating in proxy mode.

Use case 2

You have a corporate mail server in your domain that is used by your employees for everyday business activities. You want to protect your employees from phishing emails and viruses. At the same time, you want to also protect your web servers from external attacks.

In this scenario, a proxy inspection policy is recommended to prioritize the safety of employee emails. Applying the antivirus and email filter in this mode allows you to filter out any malware and spam emails received by the mail servers via SMTP or MAPI. An IPS sensor would be used to prevent DOS attacks on the mail servers.

Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the *Feature set* option to be *Flow-based* or *Proxy-based* to display only the settings for that mode.

UTM Profile	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
	GUI	CLI	GUI	CLI	
AntiVirus	Yes	Yes	Yes	Yes	GUI/CLI
Web Filter	Yes	Yes	Yes	Yes	GUI/CLI
Video Filter	No	No	Yes	Yes	N/A
DNS Filter	Yes	Yes	Yes	Yes	N/A
Application Control	Yes	Yes	Yes	Yes	N/A
Inline CASB	No	No	Yes	Yes	N/A
Intrusion Prevention System	Yes	Yes	Yes	Yes	N/A
File Filter	Yes	Yes	Yes	Yes	GUI/CLI
Email Filter	Yes	Yes	Yes	Yes	GUI/CLI
VoIP	Yes	Yes	Yes	Yes	N/A
ICAP	No	No	Yes	Yes	N/A
Web Application Firewall	No	No	Yes	Yes	N/A

UTM Profile	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
	GUI	CLI	GUI	CLI	
Data Leak Prevention	No	Yes	Yes	Yes	CLI
Virtual Patching	Yes	Yes	Yes	Yes	N/A
SSL/SSH Inspection	Yes	Yes	Yes	Yes	N/A

The following sections outline differences between flow-based and proxy-based inspection for a security profile.

Feature comparison between Antivirus inspection modes

The following table indicates which Antivirus features are supported by their designated scan modes.

Part1	Replacement Message	Content Disarm	Mobile Malware	Virus Outbreak	Sandbox Post-Transfer Scanning	Sandbox Inline Scanning	NAC Quarantine
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes*	No	Yes	Yes	Yes	No	Yes

*IPS Engine caches the URL and a replacement message is presented after the second attempt.

Part 2	Archive Blocking	Emulator	Client Comforting	Infection Quarantine	Heuristics	Treat EXE as Virus
Proxy	Yes	Yes	Yes	Yes (1)	Yes	Yes (2)
Flow	Yes	Yes	No	Yes	Yes	Yes (2)

1. Only available on FortiGate models with HDD or when FortiAnalyzer or FortiGate Cloud is connected and enabled.
2. Only applies to inspection on IMAP, POP3, SMTP, and MAPI protocols.

Part 3	External Blocklist	EMS Threat Feed	AI/ML Based Detection	FortiNDR Inline Detection
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

Feature comparison between Web Filter inspection modes

The following table indicates which Web Filter features are supported by their designated inspection modes.

	FortiGuard Category-Based Filter	Category Usage Quota	Override Blocked Categories	Search Engines	Static URL Filter	Rating Option	Proxy Option	Web Profile Override
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes (2)	No	Yes	Yes	Limited (3)	No

1. Local Category and Remote Category filters do not support the warning and authenticate actions.
2. Local Category and Remote Category filters cannot be overridden.
3. Only HTTP POST Action is supported.

Feature comparison between Email Filter inspection modes

The following tables indicate which Email Filters are supported by the specified inspection modes for local filtering and FortiGuard-assisted filtering.

Local Filtering	Banned Word Check	Block/Allow List	HELO/ EHLO DNS Check	Return Address DNS Check	DNSBL/ ORBL Check	MIME Header Check
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	No	No	No	Yes

FortiGuard-Assisted Filtering	Phishing URL Check	Anti-Spam Block List Check	Submit Spam to FortiGuard	Spam Email Checksum Check	Spam URL Check
Proxy	Yes	Yes	Yes	Yes	Yes
Flow	No	No	No	No	No

Feature comparison between DLP inspection modes

The following table indicates which DLP filters are supported by their designated inspection modes.

	Credit Card Filter	SSN Filter	Regex Filter	File-Type Filter	File-Pattern Filter	Fingerprint Filter	Watermark Filter	Encrypted Filter	File-Size Filter
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes*

*File-size filtering only works if file size is present in the protocol exchange.

Proxy feature visibility in the GUI for low-end models

The `gui-proxy-inspection` setting under `config system settings` is enabled on most models except for low-end platforms with 2 GB of RAM or less. When this setting is disabled:

- Proxy-based only profiles such as *ICAP*, *Web Application Firewall*, *Video Filter*, and *Zero Trust Network Access* are disabled (grayed out) on the *System > Feature Visibility* page.
- The *Feature set* field is disabled on UTM profiles. Only flow-based features are shown.

Example AV profile:

- Firewall policy pages do not have option to select a *Flow-based* or *Proxy-based* inspection mode.
- Proxy-based UTM profiles cannot be selected within policy configurations or other areas.

Note the following exceptions:

- If the proxy feature set is enabled from the CLI or carried over from upgrading, it can be displayed in the GUI.
- If proxy-based inspection mode is enabled from the CLI or carried over from upgrading, it can be displayed in GUI firewall policy pages.

Example AV profile being edited from the *New Policy* page after upgrading:

To enable proxy features on low-end platforms:

```
config system settings
    set gui-proxy-inspection enable
end
```

Antivirus

FortiOS offers the unique ability to implement both flow-based and proxy-based antivirus concurrently, depending on the traffic type, users, and locations. Flow-based antivirus offers higher throughput performance.

FortiOS includes two preloaded antivirus profiles:

- *default*
- *wifi-default*

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

The following topics provide information about antivirus profiles:

- [Configuring an antivirus profile on page 1434](#)
- [Proxy mode stream-based scanning on page 1437](#)

- [Databases on page 1441](#)
- [Content disarm and reconstruction on page 1442](#)
- [FortiGuard outbreak prevention on page 1444](#)
- [External malware block list on page 1446](#)
- [Malware threat feed from EMS on page 1449](#)
- [Checking flow antivirus statistics on page 1451](#)
- [CIFS support on page 1453](#)
- [Using FortiSandbox post-transfer scanning with antivirus on page 1459](#)
- [Using FortiSandbox inline scanning with antivirus on page 1461](#)
- [Using FortiNDR inline scanning with antivirus on page 1471](#)
- [Exempt list for files based on individual hash on page 1474](#)
- [Downloading quarantined files in archive format NEW on page 1475](#)

Protocol comparison between antivirus inspection modes

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes*	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:

- Cannot detect infections within some archive files.
- Cannot detect oversized files.

Other antivirus differences between inspection modes

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned. When handling oversized files in flow-based AV, the action can either be pass (default) or block. When the action is pass, IPS appends to-be-scan data into the AV scan buffer. If the appended file size exceeds the oversize-limit that is defined in the protocol option profile, then the AV session is cleared and the file is bypassed from AV scanning.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon receives the file and then decides if it can do an in-process scan of the file in simple AV configuration scenarios. If the file is in an oversized archive that is supported by the stream-based decompressor, then it is sent to stream-based scan for best effort inspection. Stream-based scan decompresses and scans the entire archive without archiving the file. If the file is not supported by stream-based scan, then it is buffered and then sent to the scanunit daemon for inspection on content that is under the oversize limit.

In legacy mode, stream-based scanning is disabled, so oversized archive files and files that cannot be handled by WAD in-process scan are buffered and sent to the scanunit daemon for processing.

AI-based malware detection

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The `machine-learning-detection` setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```
config antivirus settings
    set machine-learning-detection {enable| monitor | disable}
end
```

Configuring an antivirus profile

In an antivirus profile, the FortiGate can be configured to apply antivirus protection to HTTP, FTP, IMAP, POP3, SMTP, CIFS, and NNTP sessions. Proxy-based profiles also support MAPI and SSH. Antivirus inspection prevents potentially unwanted and malicious files from entering the network. Antivirus profiles include multiple different functions, such as scanning files for virus signatures, scanning for advanced persistent threats, checking external malware hash lists and threat feeds, and others. Malicious files can be blocked or monitored, and can be quarantined. Some antivirus profile options require a license and/or other Fortinet products. Some antivirus profile options can only be configured in the CLI (refer to the [FortiOS CLI Reference](#)).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

To configure an antivirus profile:

1. Go to *Security Profiles > AntiVirus* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).
<i>AntiVirus scan</i>	Enable one or more protocols for inspection, then enable <i>AntiVirus scan</i> for the selected protocols with a specified action. <ul style="list-style-type: none"> • <i>Block</i>: block the malicious traffic. • <i>Monitor</i>: log malicious traffic and allow it to pass inspection.
<i>Feature set</i>	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy. <ul style="list-style-type: none"> • <i>Flow-based</i> • <i>Proxy-based</i>

	<p>Additional options are available in proxy-based mode and are identified in the GUI with a <i>P</i> icon. See Inspection mode feature comparison on page 1428 for more details.</p> <p>If the <i>Feature set</i> option is not visible, enter the following in the CLI:</p> <pre>config system settings set gui-proxy-inspection enable end</pre>
<i>Inspected Protocols</i>	<p>Enable to inspect the protocol for session inspection: HTTP, SMTP, POP3, IMAP, FTP, and CIFS. Disabled protocols are not inspected.</p> <p>MAPI and SSH can be inspected in proxy-based mode.</p>
<i>APT Protection Options</i>	<p>This section includes options available with FortiGuard to mitigate advanced persistent threats (APT) in file-based attacks.</p>
<i>Content Disarm and Reconstruction</i>	<p>This option is available in proxy-based mode when at least one protocol is enabled for inspection and <i>AntiVirus scan</i> is enabled.</p> <p>Enable to allow the FortiGate to sanitize Microsoft Office documents and PDF files (including files in ZIP archives) by removing active content (disarm) without affecting the integrity of the textual content (reconstruction). See Content disarm and reconstruction on page 1442 for more details.</p>
<i>Allow transmission when an error occurs</i>	<p>Enable to allow traffic to pass when an inspection error occurs. Disable to block traffic when an inspection error occurs.</p>
<i>Original File Destination</i>	<p>Specify how to quarantine files processed by content disarm and reconstruction.</p> <ul style="list-style-type: none"> • <i>FortiSandbox</i>: quarantine files on FortiSandbox. The FortiSandbox must be enabled. See Using FortiSandbox post-transfer scanning with antivirus on page 1459 for more details. • <i>File Quarantine</i>: quarantine files on FortiGate models with a hard disk. • <i>Discard</i>: discard suspicious files.
<i>Treat Windows executables in email attachments as viruses</i>	<p>Enable to deem all Windows executable files located in email traffic as viruses.</p>
<i>Send Files to FortiSandbox for Inspection</i>	<p>Enable to send files to FortiSandbox for inspection. The FortiSandbox must be enabled.</p>
<i>Scan strategy</i>	<p>FortiSandbox scans files inline for flow-based mode (<i>Inline</i>) and after the file transfer is complete for proxy-based mode (<i>Post Transfer</i>). See Using FortiSandbox inline scanning with antivirus on page 1461 and Using FortiSandbox post-transfer scanning with antivirus on page 1459 for more details.</p>
<i>File types</i>	<p>Specify which files to FortiSandbox for inspection.</p> <ul style="list-style-type: none"> • <i>Suspicious Files Only</i>: only send suspicious files to FortiSandbox for inspection. • <i>All Supported Files</i>: send all supported files to FortiSandbox for inspection.

<i>Do not submit files matching types</i>	Click the + to exclude certain file types from being sent to FortiSandbox.
<i>Do not submit files matching file name patterns</i>	Click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.
<i>Use FortiSandbox database</i>	Enable to use the signature database from FortiSandbox. The FortiSandbox must be enabled.
<i>Send files to FortiNDR for inspection</i>	This option is available in proxy-based mode when at least one protocol is enabled for inspection, <i>AntiVirus scan</i> is enabled, and FortiNDR is enabled. See Using FortiNDR inline scanning with antivirus on page 1471 for more details.
<i>Include mobile malware protection</i>	Enable to use the mobile malware protection database from FortiGuard for content scanning.
<i>Quarantine</i>	This option is available when at least one protocol is enabled for inspection and <i>AntiVirus scan</i> is enabled. Enable to quarantine infected files. See also Downloading quarantined files in archive format NEW on page 1475 .
<i>Virus Outbreak Prevention</i>	This section includes options available with the FortiGuard Virus Outbreak Protection Service. A license is required to use these options. See FortiGuard outbreak prevention on page 1444 for more details.
<i>Use FortiGuard outbreak prevention database</i>	Enable to use the outbreak prevention database that is available with Advanced Malware Protection on FortiGuard. A license is required. <ul style="list-style-type: none"> • <i>Block</i>: block the malicious traffic. • <i>Monitor</i>: log malicious traffic and allow it to pass inspection.
<i>Use external malware block list</i>	Enable to use one or more external blocklist file hashes. See Malware hash threat feed on page 3119 for more details. <ul style="list-style-type: none"> • <i>Block</i>: block the malicious traffic. • <i>Monitor</i>: log malicious traffic and allow it to pass inspection. • <i>All</i>: use all malware block lists. • <i>Specify</i>: select specific malware block lists.
<i>Use EMS threat feed</i>	This option is available when at least one protocol is enabled for inspection and <i>AntiVirus scan</i> is enabled. Enable to use malware threat feeds from FortiClient EMS. A FortiClient EMS Fabric connector with EMS threat feed enabled is required. See Malware threat feed from EMS on page 1449 for more details.

3. Click OK.

Protocol options

When applying an antivirus profile to a firewall policy, the protocol options profile defines parameters for handling protocol-specific traffic. These parameters affect functions such as the port mapping for inspecting each protocol, whether to log or block oversized files when performing AV scanning, enabling comfort client, and more. Protocol options

profiles are configured by going to *Policy & Objects > Protocol Options*, or in the CLI under `config firewall profile-protocol-options`. See [Protocol options on page 1339](#) for more information.

Scan mode

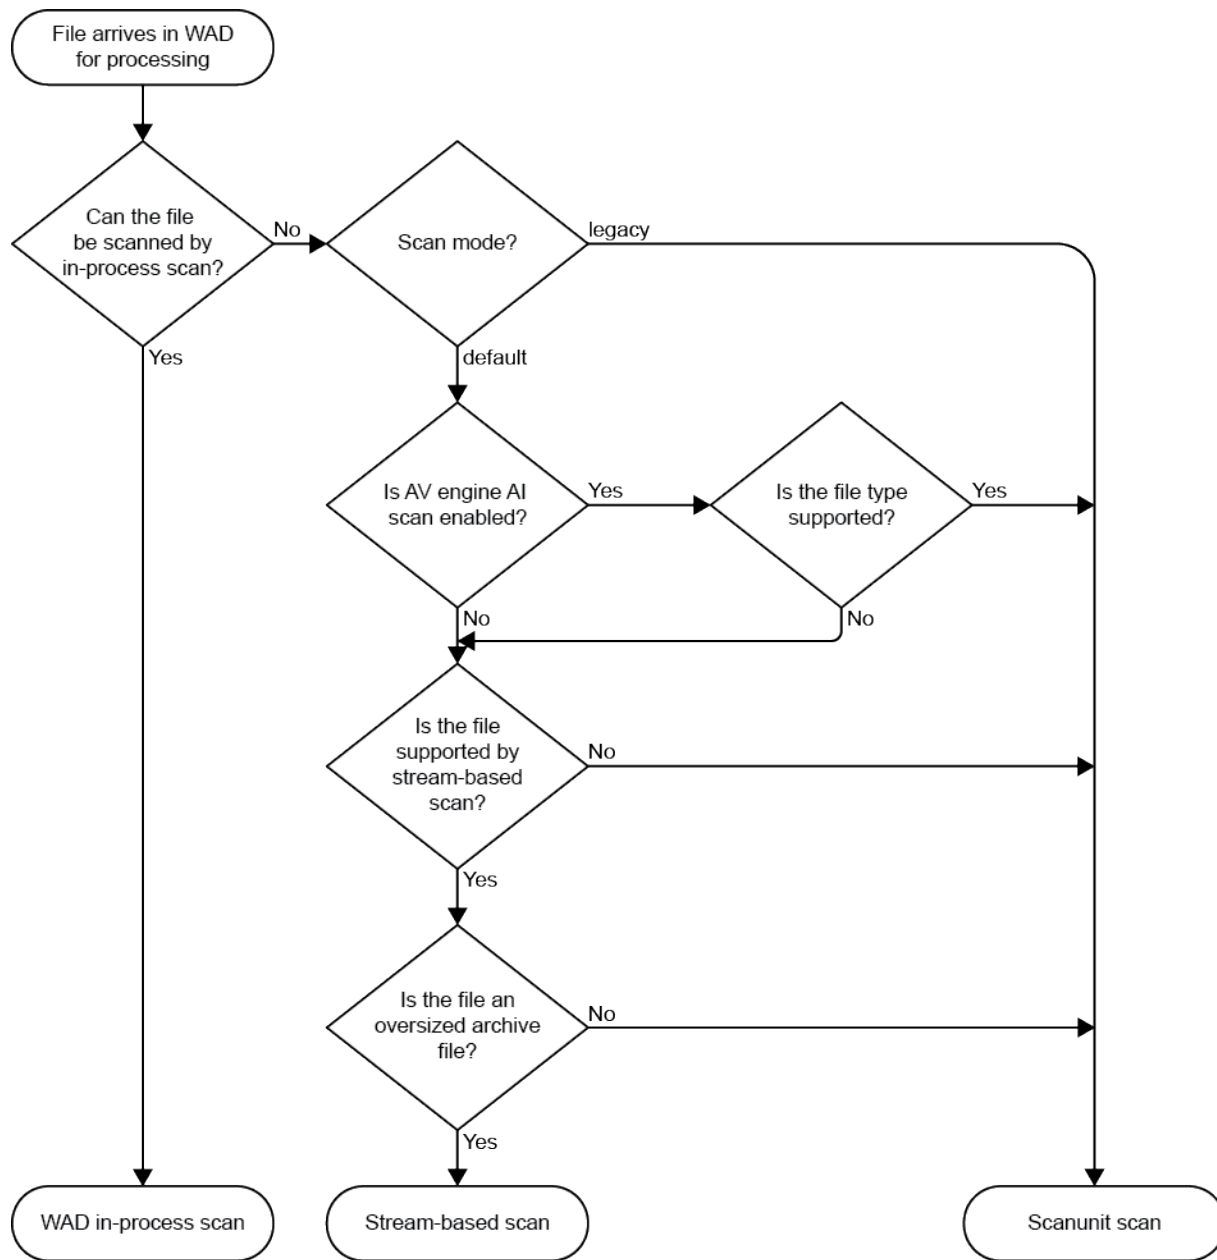

In proxy-based antivirus profiles, the scan mode can be set to either default or legacy. This setting can only be configured in the CLI. See [Proxy mode stream-based scanning on page 1437](#) for more information.

To configure the scan mode:

```
config antivirus profile
  edit <name>
    set feature-set proxy
    set scan-mode {default | legacy}
  next
end
```

Proxy mode stream-based scanning

In proxy mode, AV scanning is processed as follows:

Can the file be scanned by in-process scan?

- This is determined by the WAD daemon.
- In-process scan can be used for simple AV configurations to quickly scan a file without handing it off to another process.
- The following, more complex feature sets cannot be processed by in-process scan:
 - AV engine AI scan
 - DLP
 - Quarantine
 - FortiGuard outbreak prevention, external block list, and EMS threat feed
 - Content disarm

Scan mode?

- To configure the scan mode:

```
config antivirus profile
  edit <name>
    set feature-set proxy
    set scan-mode {default | legacy}
  next
end
```

default	Enable stream-based scanning (default).
legacy	Disable stream-based scanning.

Is AV engine AI scan enabled?

- When enabled, supported files (such as EXE, PDF, and MS Office) are forwarded to the scanunit scan.
- AV engine AI scan is enabled by default. To disable it:

```
config antivirus settings
  set machine-learning-detection disable
end
```

Is the file supported by stream-based scan?

- Stream-based scan supports the following archive file types: ZIP, GZIP, BZIP2, TAR, and ISO (ISO 9660).
- In FortiOS 7.0, stream-based scan is supported in HTTP(S), FTP(S), and SCP/SFTP.
- In FortiOS 6.4 and 6.2, stream-based scan is only supported in HTTP(S).
- Stream-based scan does not support HTTP POST.
- Stream-based scan is not supported when the following features are enabled:
 - DLP
 - Quarantine
 - FortiGuard outbreak prevention, external block list, and EMS threat feed
 - Content Disarm
- If a file is not supported, it is buffered and sent to scanunit for scanning.

Is the file an oversized archive file?

- An oversized archive file is a compressed file that is oversized according to the following setting:

```
config firewall profile-protocol-options
  edit <profile>
    config <protocol>
      set oversize-limit <size>
    end
  next
end
```

- If the file is not oversized, it is buffered and sent to scanunit for scanning.

Notes

Stream-based scans:

- Are performed with no oversize limits on a best effort basis.
- Can inspect the contents of large archive files without buffering the entire file.
- Decompress and scan the entire archive.
- Can cache infected scan results and clean the scan results (this is enabled by default):

```
config antivirus settings
    set cache-infection-result enable
    set cache-clean-result enable
end
```

Legacy scan mode:

- Used to disable stream-based scanning for troubleshooting purposes.
- Limited by the oversize and uncompressed-oversize limits:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
            set uncompressed-oversize-limit <size>
        end
    next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2 GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```
config firewall profile-protocol-options
    edit <string>
        config {http | ftp | ssh | cifs}
            set stream-based-uncompressed-limit <integer>
            set tcp-window-type {auto-tuning | system | static | dynamic}
            set tcp-window-size <integer>
            set tcp-window-minimum <integer>
            set tcp-window-maximum <integer>
        end
    next
end
```

- | | |
|---------------------------|--|
| {http ftp ssh cifs} | <ul style="list-style-type: none"> • http: Configure HTTP protocol options. • ftp: Configure FTP protocol options. |
|---------------------------|--|

	<ul style="list-style-type: none"> • <code>ssh</code>: Configure SFTP and SCP protocol options. • <code>cifs</code>: Configure CIFS protocol options.
<code>stream-based-uncompressed-limit</code> <integer>	<p>The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)).</p> <p>Stream-based uncompressed used only under certain conditions.).</p>

<code>tcp-window-size</code> <integer>	<p>The TCP static window size (65536 - 33554432, default = 262144).</p> <p>This option is only available when <code>tcp-window-type</code> is <code>static</code>.</p>
<code>tcp-window-minimum</code> <integer>	<p>The minimum TCP dynamic window size (65536 - 1048576, default = 131072).</p> <p>This option is only available when <code>tcp-window-type</code> is <code>dynamic</code>.</p>
<code>tcp-window-maximum</code> <integer>	<p>The maximum TCP dynamic window size (1048576 - 33554432, default = 8388608).</p> <p>This option is only available when <code>tcp-window-type</code> is <code>dynamic</code>.</p>

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Low-end FortiGate models cannot support the extreme database. The FortiGate 300D is the lowest model that supports the extreme database. All VMs support the extreme database. The `use-extreme-db` setting is only available on models that support the extreme database.

Extended	This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.
Extreme	This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.

To change the antivirus database:

```
config antivirus settings
    set use-extreme-db {enable | disable}
end
```

Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction). It allows network administrators to protect their users from malicious document files.

Files processed by CDR can be stored locally for quarantine on FortiAnalyzer, FortiSandbox, or FortiGate models with a hard disk. The original copies can also be obtained in the event of a false positive.

CDR is supported on HTTP, SMTP, POP3, and IMAP. Note that SMTP splice and client-comfort mode are not supported. CDR does not support flow-based inspection modes.

Sample topology

In this example, the a Microsoft Office document with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated.

To configure CDR:

1. Go to *Security Profiles > AntiVirus*.
2. Edit an antivirus profile, or create a new one.

3. Under *APT Protection Options*, enable *Content Disarm and Reconstruction*.

4. Select a quarantine location from the available options:

FortiSandbox	Saves the original document file to a connected FortiSandbox.
File Quarantine	Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (<code>config log fortianalyzer setting</code>).
Discard	The default setting, which discards the original document file.

5. Click **OK**.

To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```
config antivirus profile
  edit av
    config content-disarm
      set office-macro disable
      set detect-only {enable | disable}
      set cover-page {enable | disable}
    end
  next
end
```

Where:

detect-only	Only detect disarmable files, do not alter content. Disabled by default.
cover-page	Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.

FortiGuard outbreak prevention

FortiGuard Virus Outbreak Protection Service (VOS) allows the FortiGate antivirus database to be subsidized with third-party malware hash signatures curated by FortiGuard. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. The antivirus database queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

To verify FortiGuard antivirus license information:

1. Go to **System > FortiGuard** and locate the **Outbreak Prevention** section in the table.

The screenshot shows the FortiGuard Distribution Network configuration page. The main section is 'License Information', which contains a table of entitlements and their status. The 'Outbreak Prevention' entitlement is listed as 'Licensed' with an expiration date of 2022/01/29. Below this table is a section for 'FortiGuard Updates' with options for scheduled updates (Every, Daily, Weekly, Automatic) and a section for 'FortiGuard Filter Rating Servers' showing the status of various services.

Entitlement	Status	Actions
FortiCare Support	Registered	Actions
Virtual Machine	Valid (Expiration Date: 2022/01/28)	FortiGate VM License
Firmware & General Updates	Licensed (Expiration Date: 2022/01/29)

Edit in CLI
Local Out Setting

2. See the instructions in the video, [How to Purchase or Renew FortiGuard Services](#), if required.

To enable FortiGuard outbreak prevention:

1. Go to **Security Profiles > AntiVirus**.
2. Edit an antivirus profile, or create a new one.

3. Under *Virus Outbreak Protection*, enable *Use FortiGuard outbreak prevention database*.
4. Click **OK**.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating
Locale      : english

Service     : Web-filter
Status      : Enable
License     : Contract

Service     : Antispam
Status      : Disable

Service     : Virus Outbreak Prevention
Status      : Enable
License     : Contract

```

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every n minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

To create the external block list:

1. Create the malware hash list.

The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234 md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766 sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379 sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

2. Configure the external malware block list source:

- a. Go to *Security Fabric > External Connectors* and click *Create New*.
- b. Click *Malware Hash*.
- c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
- d. Click *OK*.

3. To view entries inside the malware block list on the *External Connectors* page, hover over the malware hash card and click *View Entries*.

To configure antivirus to use an external block list in the GUI:

1. Go to *Security Profiles > AntiVirus* and edit the antivirus profile.
2. In the *Virus Outbreak Prevention* section, enable *Use external malware block list* and click *Specify*.
3. Click the + in the field and select a threat feed.

4. Optionally, enable *Quarantine*.

The screenshot shows the 'New AntiVirus Profile' configuration window in FortiGate. The profile is named 'Demo'. The 'AntiVirus scan' feature set is set to 'Proxy-based'. Under 'Inspected Protocols', HTTP, SMTP, POP3, IMAP, FTP, CIFS, and MAPI are enabled, while SSH is disabled. Under 'APT Protection Options', 'Quarantine' is enabled. Under 'Virus Outbreak Prevention', 'Use FortiGuard outbreak prevention database' and 'Use external malware block list' are enabled. The 'Specify' button for the external block list is highlighted, showing a list with 'malhash1'.

5. Configure the other settings as needed.

6. Click **OK**.

To configure antivirus to use an external block list in the CLI:

```
config antivirus profile
edit "Demo"
    set feature-set proxy
    set mobile-malware-db enable
    config http
        set av-scan disable
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set content-disarm disable
    end
    config ftp
        set av-scan disable
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
    end
    config imap
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
    end
end
```

```
        set content-disarm disable
    end
    config pop3
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
        set content-disarm disable
    end
    config smtp
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
        set content-disarm disable
    end
    config mapi
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
    end
    config nntp
        set av-scan disable
        set outbreak-prevention disable
        set external-blocklist disable
        set quarantine disable
        set emulator enable
    end
    config cifs
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
    end
    config ssh
        set av-scan disable
        set outbreak-prevention disable
        set external-blocklist disable
        set quarantine disable
        set emulator enable
    end
    set outbreak-prevention-archive-scan enable
    set external-blocklist-enable-all disable
    set external-blocklist "malhash1"
    set av-virus-log enable
    set av-block-log enable
    set extended-log disable
    set scan-mode default
```

```
next
end
```

The quarantine setting is configured in each protocol (`set quarantine`). The malware threat feed is also specified (`set external-blocklist-enable-all disable`) to the threat connector, `malhash1` (`set external-blocklist "malhash1"`).

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec234' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_
sample2'
sha256 '0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521' profile 'malhash1'
description ''
sha256 'ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379' profile 'malhash1'
description 'sha256_sample1'
```

Malware threat feed from EMS

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS threat feed in an antivirus profile in the GUI:

1. Enable the EMS threat feed:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
 - b. Enable *EMS threat feed*.
 - c. Configure the other settings if needed (see [Configuring FortiClient EMS on page 2789](#) for more details).
 - d. Click **OK**.
2. Create the antivirus profile:
 - a. Go to *Security Profiles > AntiVirus* and click **Create New**.
 - b. In the *Virus Outbreak Prevention* section, enable *Use EMS threat feed*.

c. Configure the other settings as needed.

d. Click OK.

To configure an EMS threat feed in an antivirus profile in the CLI:

1. Enable the EMS threat feed:

```
config endpoint-control fctems
  edit "WIN10-EMS"
    set fortinetone-cloud-authentication disable
    set server "192.168.20.10"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    unset capabilities
    set call-timeout 30
    set websocket-override disable
  next
end
```

2. Create the antivirus profile:

```
config antivirus profile
  edit "av"
    config http
      set av-scan block
    end
    config ftp
      set av-scan block
    end
  end
```

```

end
config imap
    set av-scan block
end
config pop3
    set av-scan block
end
config smtp
    set av-scan block
end
config cifs
    set av-scan block
end
set external-blocklist-enable-all enable
set ems-threat-feed enable
next
end

```

Sample log

```

# execute log filter category utm-virus
# execute log display

```

```

```

Checking flow antivirus statistics

Two CLI commands are used for the antivirus statistics:

- `diagnose ips av stats show`
- `diagnose ips av stats clear`

SNMP uses an API to get the antivirus statistics.

To check flow antivirus statistics:**1. Create an antivirus profile:**

```
config antivirus profile
  edit "av-test"
    config http
      set av-scan monitor
    end
    config ftp
      set av-scan block
      set quarantine enable
    end
  next
end
```

2. Enable the profile in a firewall policy:

```
config firewall policy
  edit 1
    set name "policy1"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set fsso disable
    set av-profile "av-test"
    set ssl-ssh-profile "custom-deep-inspection"
    set nat enable
  next
end
```

3. On the client PC, download the EICAR Standard Anti-Virus Test File via HTTP.**4. Check the antivirus statistics on the FortiGate. Since the action is set to monitor for HTTP, HTTP virus detected increases by 1:**

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 0
FTP virus blocked: 0
SMB virus detected: 0
SMB virus blocked: 0
```

5. On the client PC, download the EICAR file via FTP.

6. Check the antivirus statistics on the FortiGate. Since quarantine is enabled for FTP, FTP virus detected and FTP virus blocked increase by 1:

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 1
FTP virus blocked: 1
SMB virus detected: 0
SMB virus blocked: 0
```

7. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
iso.3.6.1.4.1.12356.101.8.2.1.1.1.1 = Counter32: 2 (fgAvVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.2.1 = Counter32: 1 (fgAvVirusBlocked)
iso.3.6.1.4.1.12356.101.8.2.1.1.3.1 = Counter32: 1 (fgAvHTPVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.4.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.5.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.6.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.7.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.9.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.10.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.11.1 = Counter32: 1 (fgAvFTPVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.12.1 = Counter32: 1 (fgAvFTPVirusBlocked)
iso.3.6.1.4.1.12356.101.8.2.1.1.13.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.14.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.15.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.16.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.17.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.18.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.19.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.20.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.21.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.22.1 = Counter32: 0
```

8. Optionally, reset the antivirus statistics to zero:

```
# diagnose ips av stats clear
```

CIFS support

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file's magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server's credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See [Proxy mode inspection on page 1426](#) for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

Configure file-type filtering and antivirus scanning on CIFS traffic

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. [Configure a CIFS domain controller on page 1454](#)
2. [Configure a CIFS profile on page 1454](#)
3. [Configure an antivirus profile on page 1456](#)

Configure a CIFS domain controller

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.

To configure the CIFS domain controller:

```
config user domain-controller
    edit "SERVER_NAME"
        set hostname "host"
        set domain-name "EXAMPLE.COM"
        set username "admin-super"
        set password "*****"
        set ip 172.16.201.40
    next
end
```

Configure a CIFS profile

To create a CIFS profile, configure the server credential type and create a file filter profile.

Set the CIFS server credential type

The CIFS server credential type can be `none`, `credential-replication`, or `credential-keytab`.

none

The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.

```
config firewall profile-protocol-options
    edit "cifs"
```

```

        config cifs
            set server-credential-type none
        end
    next
end

```

credential-replication

To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.

```

config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-replication
            set domain-controller "SERVER_NAME"
        end
    next
end

```

Variable	Description
domain-controller <string>	The previously configured domain to decrypt CIFS traffic for.

credential-keytab

To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.

```

config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-keytab
            config server-keytab
                edit "keytab1"
                    set keytab
"BQIAABFAAEAC0VYQU1QTEUuQ09NAAdleGFtcGx1AAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQid0Bzxxh
wS9h0VgyM"
                next
            end
        end
    next
end

```

Variable	Description
keytab <keytab>	Base64 encoded keytab file containing the credentials of the server.

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See [File filter on page 1615](#).

To configure a file filter for CIFS traffic:

```

config file-filter profile
  edit "cifs"
    set comment "block zip files on unencrypted cifs traffic"
    set feature-set flow
    set replacemsg-group ''
    set log enable
    config rules
      edit "rule1"
        set protocol cifs
        set action block
        set direction any
        set password-protected any
        set file-type zip
      next
    end
  next
end

```

Variable	Description
comment <string>	A brief comment describing the entry.
feature-set {flow proxy}	Flow or proxy mode feature set (default = flow).
replacemsg-group <string>	Replacement message group.
log {enable disable}	Enable/disable file filter logging (default = enable).
scan-archive-contents [enable disable]	Enable/disable scanning of archive contents (default = enable).
protocol {http ftp smtp imap pop3 mapi cifs ssh}	Filter based on the specified protocol(s).
action {log-only block}	The action to take for matched files: <ul style="list-style-type: none"> log-only: Allow the content and write a log message (default). block: Block the content and write a log message.
direction {incoming outgoing any}	Match files transmitted in the session's originating (incoming) and/or reply (outgoing) direction (default = any).
password-protected [yes any]	Match only password-protected files (yes) or any file (default = any).
file-type <file_type>	The file types to be matched. See Supported file types on page 1621 for details.

Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

To configure an antivirus profile:

```

config antivirus profile
  edit "av"
    ...
    config cifs
  end
end

```

```

        set av-scan {disable | block | monitor}
        set outbreak-prevention {disable | block | monitor}
        set external-blocklist {disable | block | monitor}
        set quarantine {enable | disable}
        set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
        set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
        set emulator {enable | disable}
    end
next
end

```

Variable	Description
av-scan	Enable antivirus scan service: <ul style="list-style-type: none"> • disable: Disable (default). • block: Block the virus infected files. • monitor: Log the virus infected files.
outbreak-prevention {disable block monitor}	Enable the virus outbreak prevention service: <ul style="list-style-type: none"> • disable: Disable (default). • block: Block the matched files. • monitor: Log the matched files.
external-blocklist {disable block monitor}	Enable the external blocklist: <ul style="list-style-type: none"> • disable: Disable (default). • block: Block the matched files. • monitor: Log the matched files.
quarantine {enable disable}	Enable/disable quarantine for infected files (default = disable).
archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to block: <ul style="list-style-type: none"> • encrypted: Block encrypted archives. • corrupted: Block corrupted archives. • partiallycorrupted: Block partially corrupted archives. • multipart: Block multipart archives. • nested: Block nested archives. • mailbomb: Block mail bomb archives. • fileslimit: Block exceeded archive files limit. • timeout: Block scan timeout. • unhandled: Block archives that FortiOS cannot open.
archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to log: <ul style="list-style-type: none"> • encrypted: Log encrypted archives. • corrupted: Log corrupted archives. • partiallycorrupted: Log partially corrupted archives. • multipart: Log multipart archives. • nested: Log nested archives. • mailbomb: Log mail bomb archives. • fileslimit: Log exceeded archive files limit. • timeout: Log scan timeout.

Variable	Description
	<ul style="list-style-type: none"> unhandled: Log archives that FortiOS cannot open.
emulator {enable disable}	Enable/disable the virus emulator (default = enable).

Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-cifs` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the [FortiOS Log Message Reference](#) for more information.

Logs generated by CIFS profile file filter:

```

Using FortiSandbox post-transfer scanning with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

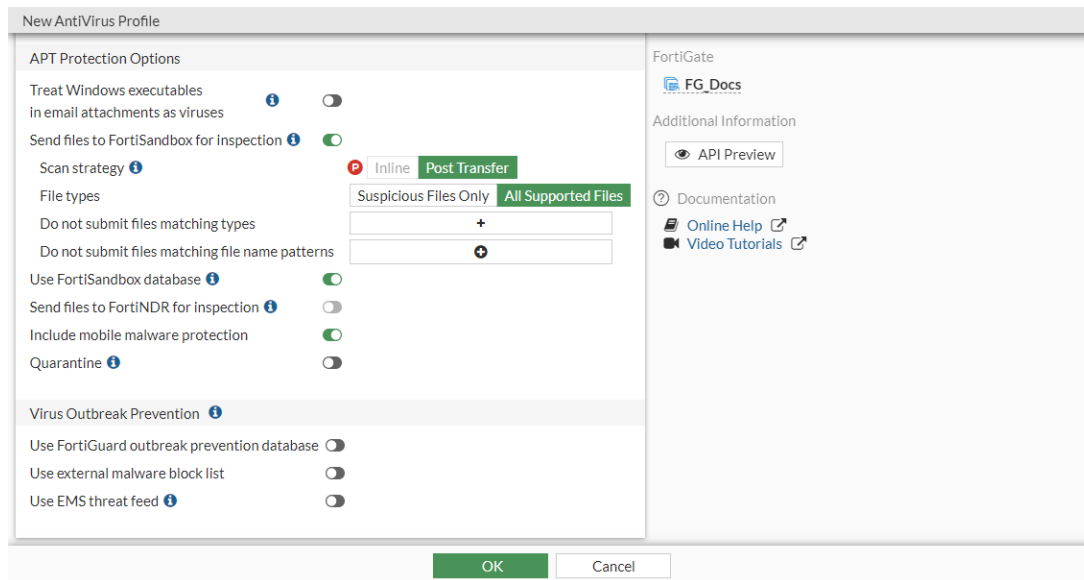

FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

- *All Supported Files*: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- *Suspicious Files Only*: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission limits.
- *None*: files are not forwarded to FortiSandbox.

For more information, see [Configuring sandboxing on page 2811](#).

To enable FortiSandbox inspection in an antivirus profile:

1. Go to *Security Profiles > AntiVirus*.
2. Create, edit, or clone an antivirus profile.
3. In the *APT Protection Options* section, set *Send Files to FortiSandbox for Inspection* to either *Suspicious Files Only* or *All Supported Files*.
4. Optionally, for *Do not submit files matching types*, click the + to exclude certain file types from being sent to FortiSandbox.
5. Optionally, for *Do not submit files matching file name patterns*, click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.

6. Enable *Use FortiSandbox Database*.

7. Click **OK**.

FortiGate diagnostics

To view the detection count:

```
# diagnose test application quarantined 7
Total: 0
```

Statistics:

```
vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_
reached:0
```

To verify the address is configured correctly:

```
# diagnose test application quarantined 1
...
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
...
```

To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
...
Active APTServer status: up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

```
# diagnose test application quarantined 2
```

FortiSandbox diagnostics

To run the OFTP debug for advanced debugging:

```
# diagnose-debug device <client serial number>
```

Using FortiSandbox inline scanning with antivirus

FortiSandbox inline scanning can be used in proxy inspection mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see [Protocol options on page 1339](#)). For example, leaking a certain amount of bytes at a certain time interval to the client. Once a verdict is returned, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate's configuration. This feature is not supported on FortiSandbox Cloud.

This topic describes how to configure the following:

- [FortiSandbox appliance inline scanning](#)
- [FortiGuard AI-Based Sandbox Service inline scanning](#)
- [FortiSandbox scanning error and timeout actions](#)

FortiSandbox appliance inline scanning

Inline scanning requires a FortiSandbox appliance running version 4.2 or later, and the FortiSandbox must be reachable by port 4443. See [Understanding Inline Block feature](#) in the FortiSandbox Best Practices for more information.

FortiSandbox inline scanning is disabled by default. FortiSandbox inline scanning is best used in conjunction with AV engine scanning since there is a higher rate of detection by using both at the same time.

To enable FortiSandbox inline scanning:

```
config system fortisandbox
    set status enable
    set inline-scan {enable | disable}
    set server <fortisandbox_server_ip>
end
```

To configure the FortiSandbox scanning options in an antivirus profile:

```
config antivirus profile
    edit <name>
        set fortisandbox-mode {inline | analytics-suspicious | analytics-everything}
        set fortisandbox-error-action {ignore | log-only | block}
```

```

        set fortisandbox-timeout-action {ignore | log-only | block}
        set fortisandbox-max-upload <integer>
        config {http | ftp | imap | pop3 | smtp | mapi | cifs | ssh}
            set av-scan {disable | block | monitor}
            set fortisandbox {disable | block | monitor}
        end
    next
end

```

<pre> fortisandbox-mode {inline analytics- suspicious analytics- everything} </pre>	<p>Set the FortiSandbox scan mode:</p> <ul style="list-style-type: none"> • <code>inline</code>: FortiSandbox inline scanning • <code>analytics-suspicious</code>: FortiSandbox post-transfer scanning; submit supported files if heuristics or other methods determine they are suspicious • <code>analytics-everything</code>: FortiSandbox post-transfer scanning; submit supported files and known infected files (default)
<pre> fortisandbox-error-action {ignore log-only block} </pre>	<p>Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox:</p> <ul style="list-style-type: none"> • <code>ignore</code>: take no action • <code>log-only</code>: log the FortiSandbox inline scan error, but allow the file (default) • <code>block</code>: block the file upon FortiSandbox inline scan error
<pre> fortisandbox-timeout- action {ignore log-only block} </pre>	<p>Set the action to take if FortiSandbox inline scanning encounters a scan timeout:</p> <ul style="list-style-type: none"> • <code>ignore</code>: take no action • <code>log-only</code>: log the FortiSandbox inline scan timeout, but allow the file (default) • <code>block</code>: block the file upon FortiSandbox inline scan timeout
<pre> fortisandbox-max-upload <integer> </pre>	<p>Set the maximum size of files that can be uploaded to FortiSandbox (1 - 396, default = 10).</p>
<pre> av-scan {disable block monitor} </pre>	<p>Enable the antivirus scan service. Set to <code>block</code> or <code>monitor</code> to work with FortiSandbox (default = <code>disable</code>).</p>
<pre> fortisandbox {disable block monitor} </pre>	<p>Set the protocol level parameter for FortiSandbox file scanning:</p> <ul style="list-style-type: none"> • <code>disable</code> (default), <code>block</code>, and <code>monitor</code> are available for inline scanning • <code>disable</code> (default) and <code>monitor</code> are available for post-transfer scanning

Basic configuration

This example assumes that *Inline Block Policy* is already enabled in FortiSandbox for the FortiGate with selected risk levels (see [FortiGate devices](#) in the FortiSandbox Administration Guide for more information). The inline block policy in this example blocks all risk levels: malicious, high risk, medium risk, and low risk.

Device Status	
Serial Number:	FG101FTK

To configure FortiSandbox inline scanning in the GUI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

2. Configure the antivirus profile:

- a. Go to *Security Profiles > AntiVirus* and click *Create New*.
- b. Set the *Feature set* to *Proxy-based*.
- c. Enable the protocols to inspect.
- d. Enable *AntiVirus scan* and set it to *Block*.
- e. Enable *Send files to FortiSandbox* for inspection and set the *Action* to *Block*. The *Scan strategy* appears as *Inline* because it was configured in the CLI.

f. Click OK.

To configure FortiSandbox inline scanning in the CLI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

2. Configure the antivirus profile:

```
config antivirus profile
    edit "Inline_scan_demo"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
        config ftp
            set av-scan block
            set fortisandbox block
        end
        config imap
            set av-scan block
            set fortisandbox block
        end
    end
```

```

end
config pop3
    set av-scan block
    set fortisandbox block
end
config smtp
    set av-scan block
    set fortisandbox block
end
config mapi
    set av-scan block
    set fortisandbox block
end
config cifs
    set av-scan block
    set fortisandbox block
end
config ssh
    set av-scan block
    set fortisandbox block
end
next
end

```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file.
2. The file is held while being scanned by FortiSandbox. Once FortiSandbox determines that file's risk level is not tolerated by the inline block policy, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.

High Security Alert

You are not permitted to download the file "skip_vm.vxE" because it is infected with the virus "Trojan".

URL http://172.16.200.184/sandbox/inline/skip_vm.vxE
 Quarantined File Name [disabled]
 Reference URL <http://www.fortinet.com/ve?vn=Trojan>

3. In FortiOS, view the antivirus log.
 - In the GUI, go to *Log & Report > Security Events* and click the *AntiVirus* card.
 - In the CLI:

```

# execute log filter category 2
# execute log display
1 logs found.
1 logs returned.

1: date=2022-03-23 time=16:19:37 eventtime=1648077577156255080 tz="-0700"

```

FortiGuard AI-Based Sandbox Service inline scanning

Inline scanning is supported when the FortiGate is licensed with the FortiGuard AI-Based Sandbox Service (FAIS). It works similar to inline scanning for the FortiSandbox appliance by holding a file up to 50 seconds for the verdict to be returned. Timed out scans can be set to block, log, or ignore. Inline scanning can be enabled from the GUI on the *Cloud Sandbox* configuration page.

Inline scanning is supported for FortiSandbox appliance, FortiNDR, and FAIS. On a FortiGate, only a single inline scanning type can be configured at a time.

To configure FAIS inline scanning in the GUI:

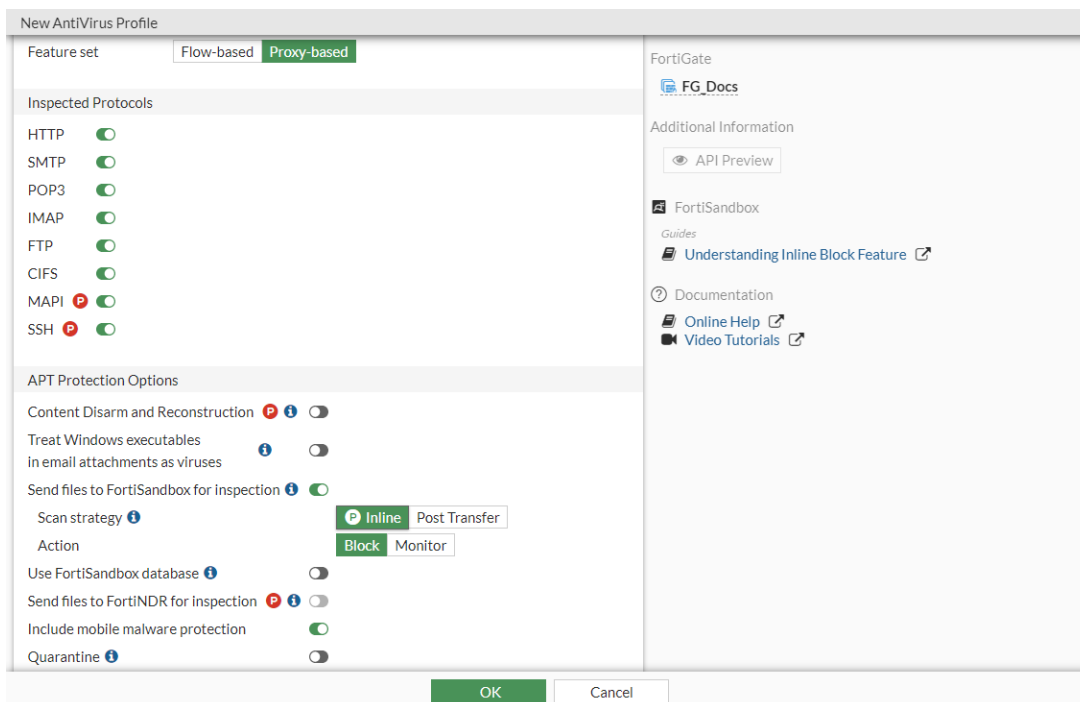

1. Enable the FortiGate Cloud feature visibility:
 - a. Go to *System > Feature Visibility*.
 - b. In the *Additional Features* section, enable *FortiGate Cloud Sandbox*.
 - c. Click *Apply*.
2. Configure the *Sandbox* Fabric connector:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Sandbox* card.
 - b. In the *Settings* tab, set the *Type* to *FortiGate Cloud*.
 - c. Select a *Region*.
 - d. Enable *Inline scan*.

e. Click **OK**.

3. Configure the antivirus profile:

- Go to *Security Profiles > AntiVirus* and click *Create New*.
- Set the *Feature set* to *Proxy-based*.
- Enable the protocols to inspect.
- Enable *Send files to FortiSandbox* for inspection.
- Set the *Scan strategy* to *Inline*, and set the *Action* to *Block*.

f. Click **OK**.

To configure FAIS inline scanning in the CLI:**1. Disable FortiSandbox appliance and FortiSandbox Cloud:**

```
config system fortisandbox
    set status disable
end
```

2. Configure FortiGate Cloud Sandbox:

```
# execute forticloud-sandbox region
0 Global
1 Europe
2 Japan
3 US
Please select cloud sandbox region[0-3]:0
Cloud sandbox region is selected: Global
```

3. Enable inline scanning for FortiGate Cloud:

```
config system fortiguard
    set sandbox-region "Global"
    set sandbox-inline-scan enable
end
```

4. Configure the antivirus profile:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        config ftp
            set fortisandbox block
        end
        config imap
            set fortisandbox block
        end
        config pop3
            set fortisandbox block
        end
        config smtp
            set fortisandbox block
        end
        config mapi
            set fortisandbox block
        end
        config cifs
            set fortisandbox block
        end
        config ssh
            set fortisandbox block
        end
        set scan-mode default
    next
end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file using HTTP.
2. The file is held while being scanned by FortiGate Cloud Sandbox. Once FortiGate Cloud Sandbox determines that file's risk level is not tolerated, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

To verify that infected files are monitored:

1. Edit the antivirus profile to monitor files over HTTP:

```
config antivirus profile
  edit "av"
    set feature-set proxy
    set fortisandbox-mode inline
    config http
      set fortisandbox monitor
    end
  next
end
```

2. On a client, open a web browser and download an infected file using HTTP.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:34:25 eventtime=1657668865371976563 tz="-0700"

fsaseverity="high-risk" fsafileid=0 fsafiletype="exe" crscore=50 craction=2
crlevel="critical"
```

To verify that infected files are blocked inline if a scan timeout occurs:

1. Edit the antivirus profile to block files over HTTP and when there is a scan timeout:

```
config antivirus profile
  edit "av"
    set feature-set proxy
    set fortisandbox-mode inline
    config http
      set fortisandbox block
    end
    set fortisandbox-timeout-action block
  next
end
```

2. On a client, open a web browser and download a large ZIP file (clean file).
3. When the scan timeout occurs, a replacement message appears that *The file "zipfile.zip" is still being scanned and will be released once complete. Please try the transfer again in a few minutes.*
4. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:44:51 eventtime=1657669491697816069 tz="-0700"
logid="0210008236" type="utm" subtype="virus" eventtype="fortisandbox" level="warning"
vd="vdom1" policyid=1 poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy"
msg="FortiSandbox scan timeout." action="blocked" service="HTTP" sessionid=20258
srcip=10.1.100.191 dstip=172.16.200.194 srcport=51830 dstport=80 srccountry="Reserved"
dstcountry="Reserved" srcintf="port1" srcintfrole="undefined" dstintf="port9"
dstintfrole="undefined" srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" proto=6 direction="incoming"
filename="zipfile.zip" quarskip="Quarantine-disabled"
url="http://172.16.200.194/sandbox/zipfile.zip" profile="av" agent="curl/7.68.0"
httpmethod="GET" analyticssubmit="false" fsaaction="timeout" fsafileid=0 crscore=50
craction=2 crlevel="critical"
```

5. After a few minutes, download the ZIP file again.
6. When the scan is complete on the FortiSandbox side, the file is downloaded and no log is generated because the scan deemed that the file is clean.

FortiSandbox scanning error and timeout actions

In this example, the HTTP protocol settings for `av-scan` and `fortisandbox` in the AV profile are both set to `block`. All files traversing HTTP in this configuration are scanned by the AV engine first, and then by FortiSandbox inline scanning for further file analysis. Based on the FortiSandbox results, FortiOS will take the appropriate action.

Files can be blocked if they contain a scan error or timeout. The scan timeout is configured in FortiSandbox and set to 50 seconds. If the file scan takes longer than 50 seconds, FortiSandbox returns a timeout to the FortiGate, and file is dropped with the current configuration. If a user tries to download the same file again, the cached result is provided by FortiSandbox to the FortiGate based on the previous file scan.

This example assumes FortiSandbox inline scanning has been configured globally. The FortiGate will block the file if there is an inline scanning error or timeout.

To configure the antivirus profile to block files if there is an inline scanning error or timeout:

```
config antivirus profile
  edit "av"
    set feature-set proxy
    set fortisandbox-mode inline
    config http
      set av-scan block
      set fortisandbox block
    end
    set fortisandbox-error-action block
    set fortisandbox-timeout-action block
  next
end
```

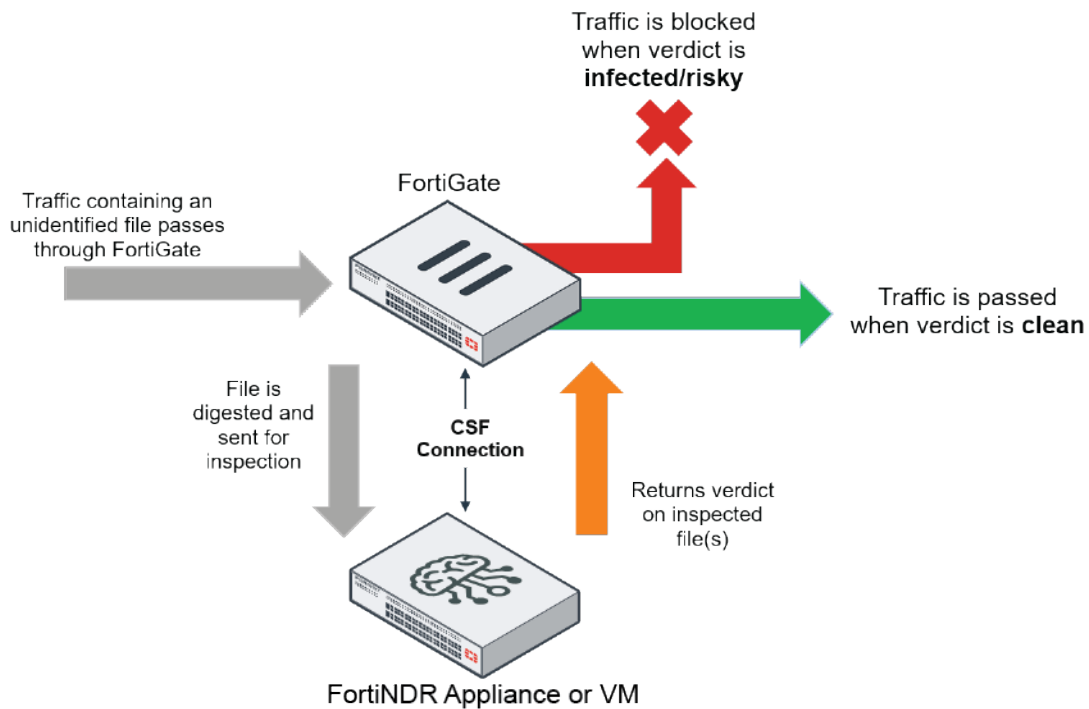

If the administrator decides to take more risk and scan all files traversing HTTP, but log or ignore an inline scanning error or timeout, the profile is modified as follows:

```
config antivirus profile
  edit "av"
    set fortisandbox-error-action {log-only | ignore}
    set fortisandbox-timeout-action {log-only | ignore}
  next
end
```

The AV engine is still used first, followed by FortiSandbox inline scanning. The FortiGate will log or ignore the file if there is an inline scanning error or timeout, and the file is allowed to pass through.

Using FortiNDR inline scanning with antivirus

FortiNDR (formerly FortiAI) can be used with antivirus profiles in proxy inspection mode (flow mode is currently not supported). FortiNDR inspects high-risk files and issues a verdict to the firewall based on how close the file features match those of malware. When enabled, FortiNDR can log, block, ignore, or monitor (allow) the file based on the verdict.

A licensed FortiNDR appliance with version 1.5.1 or later is required to use this feature.

To configure FortiNDR inline inspection with an AV profile:

1. Configure FortiNDR to join a Security Fabric in FortiOS (see [Configuring FortiNDR on page 2830](#)).
2. In the FortiNDR CLI, enable inline inspection:

```
config system fortindr
    set status enable
end
```

3. Configure an AV profile in FortiOS to use inline inspection and block detected infections:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set fortindr block
        end
        config ftp
            set fortindr block
        end
        config imap
            set fortindr block
        end
        config pop3
            set fortindr block
        end
    end
```

```

config smtp
    set fortindr block
end
config mapi
    set fortindr block
end
config nntp
    set fortindr block
end
config cifs
    set fortindr block
end
config ssh
    set fortindr block
end
next
end

```

4. Add the AV profile to a firewall policy. When potential infections are blocked by FortiNDR inline inspection, a replacement message appears (see [Replacement messages on page 2671](#) for more information). An infection blocked over HTTP looks similar to the following:

High Security Alert

You are not permitted to download the file "detected_samples.zip" because it is infected with the virus "MSIL/Kryptik.KVH!tr".

URL http://172.16.200.224/avengine_ai/detected_samples.zip
 Quarantined File Name [disabled]
 Reference URL <http://www.fortinet.com/ve?vn=MSIL%2FKryptik.KVH%21tr>

Sample log

```

FortiNDR inline inspection with other AV inspection methods

The following inspection logic applies when FortiNDR inline inspection is enabled simultaneously with other AV inspection methods. The AV engine inspection and its verdict always takes precedence because of performance. The

actual behavior depends on which inspected protocol is used.

HTTP, FTP, SSH, and CIFS protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
 - a. FortiNDR inline inspection occurs simultaneously.
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
 - a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
 - a. FortiNDR inline inspection occurs simultaneously.

If any AV inspection method returns an infected verdict, the FortiNDR inspection is aborted.

POP3, IMAP, SMTP, NNTP, and MAPI protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
 - a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
 - a. FortiNDR inline inspection occurs simultaneously.

In an AV profile, use `set fortindr-error-action {log-only | block | ignore}` to configure the action to take if FortiNDR encounters an error.

Accepted file types

The following file types are sent to FortiNDR for inline inspection:

7Z	HTML	RTF
ARJ	JS	TAR
BZIP	LZH	VBA
BZIP2	LZW	VBS
CAB	MS Office documents (XML and non-	WinPE (EXE)
ELF	XML)	XZ
GZIP	PDF	ZIP
	RAR	

Exempt list for files based on individual hash

The antivirus exempt list allows users to exempt known safe files that happen to be incorrectly classified as malicious by the AV signature and AV engine scan. Users can specify file hashes in MD5, SHA1, or SHA256 for matching, which are

applied at a per-VDOM level. When matched, the FortiGate ignores the AV scan verdict so that the corresponding UTM behavior defined in the AV profile is not performed.

```
config antivirus exempt-list
  edit <name>
    set hash-type {md5 | sha1 | sha256}
    set hash <string>
    set status {enable | disable}
  next
end
```

The exempt list does not apply to results from outbreak prevention, machine learning, FortiNDR, or FortiSandbox inline scans.

In this example, an antivirus exempt list is configured for the EICAR anti-malware test file. Although the antivirus profile is configured to block HTTP, the client is able to download the file.

To configure an antivirus exempt list:

1. Configure the antivirus profile:

```
config antivirus profile
  edit "av"
    set feature-set proxy
    config http
      set av-scan block
    end
  next
end
```

2. Configure the antivirus exempt list:

```
config antivirus exempt-list
  edit "test-hash"
    set comment "eicar.com"
    set hash-type md5
    set hash "44d88612fea8a8f36de82e1278abb02f"
    set status enable
  next
end
```

3. Get a client to access <https://www.eicar.com/> and download the anti-malware test file.

The FortiGate exempts the AV scan verdict and bypasses the file. The client can download the file and no replacement message is displayed.

Downloading quarantined files in archive format - NEW

The FortiGate can download quarantined files in an archive format (.TGZ) instead of the original raw file. This allows for a more detailed analysis of the quarantined files and reduces the risk of malware infection.

The FortiGate must have a disk logging capacity or be connected to FortiAnalyzer for logging.

To download a quarantined archive file:

1. Ensure that quarantining files is enabled in the AV profile:
 - a. Go to *Security Profiles > AntiVirus* and edit the AV profile.
 - b. In the *APT Protection Options* section, verify that *Quarantine* is enabled. At least one protocol must be enabled in the AV profile for inspection, and *AntiVirus scan* must be enabled for the *Quarantine* option to work.
2. Go to *Log & Report > Security Events* and select the *AntiVirus* card.
3. Select a log entry and click *Details*. The *Log Details* pane opens.
4. Select the *Archived Data* tab and click the download icon (in the *AntiVirus* title bar).

The screenshot shows the FortiGate Security Events Log interface. The 'Logs' tab is active, and a log entry is selected. The 'Details' pane is open, showing the 'Archived Data' tab. The log entry details are as follows:

Date/Time	Service	Source	File Name	Virus/Botnet	User	De	Log Details
2023/08/11 14:09:49	HTTPS	10.1.100.18	eicar.com	EICAR_TEST_...	URL: https://1		Details Archived Data

The 'Archived Data' tab shows the following details:

Status	Infected
Status Description	EICAR_TEST_FILE
Checksum	6851cf3c
File Name	eicar.com
Timestamp	1691767158000
Service	HTTP
Duplicates	3
Time Until Deletion	FOREVER

Web filter

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- *default*
- *monitor-all* (monitors and logs all URLs visited, flow-based)
- *wifi-default* (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web filters:

- [URL filter on page 1477](#)

- [Websense Integrated Services Protocol on page 1509](#)
- [Inspecting HTTP3 traffic on page 1510](#)
- [Configuring web filter profiles with Hebrew domain names on page 1512](#)

URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

URL filter type	Description
Simple	<p>The FortiGate tries to strictly match the full context. For example, if you enter <i>www.facebook.com</i> in the <i>URL</i> field, it only matches traffic with <i>www.facebook.com</i>. It won't match <i>facebook.com</i> or <i>message.facebook.com</i>.</p> <p>When the FortiGate finds a match, it performs the selected URL action.</p>
Regular expression/wildcard	<p>The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter <i>*fa*</i> in the <i>URL</i> field, it matches all the content that has <i>fa</i> such as <i>www.facebook.com</i>, <i>message.facebook.com</i>, <i>fast.com</i>, and so on.</p> <p>When the FortiGate finds a match, it performs the selected URL action.</p>

For more information, see the [URL Filter expressions](#) technical tip in the Knowledge Base.

The following actions are available:

URL filter action	Description
Exempt	The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.
Block	The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.
Allow	The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.
Monitor	The traffic is processed the same way as the <i>Allow</i> action. For the <i>Monitor</i> action, a log message is generated each time a matching traffic pattern is established.

The exempt URL filter action can be configured to bypass all or certain security profile operations. This setting can only be configured in the CLI.

If the action is set to exempt, use `set exempt` to select the security profile operations that exempt URLs skip.

```
config webfilter urlfilter
    edit <id>
        config entries
            edit <id>
                set action exempt
                set exempt {av web-content activex-java-cookie dlp fortiguard range-block
pass antiphish all}
            next
        end
    next
end
```

Option	Description
av	Antivirus scanning
web-content	Web filter content matching
activex-java-cookie	ActiveX, Java, and cookie filtering
dlp	DLP scanning
fortiguard	FortiGuard web filtering
range-block	Range block feature
pass	Pass single connection from all
antiphish	Antiphish credential checking
all	Exempt from all security profiles

These exempt options are not visible in the GUI. Setting the URL filter *Action* to *Exempt* will exempt URLs from all security profiles.

In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.

Configuring a URL filter in the GUI

To create a URL filter for Facebook:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *URL Filter*.
3. Click *Create New*. The *New URL Filter* pane opens.
4. For URL, enter **facebook.com*, for *Type*, select *Wildcard*, and for *Action*, select *Block*.

5. Click *OK*. The entry appears in the table.

URL	Type	Action	Status
*facebook.com	Simple	Block	Enable

6. Configure the other settings as needed.
7. Click *OK*.

To apply the web filter profile to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Edit a policy, or create a new one.
3. In the *Security Profiles* section, enable *Web Filter* and select the profile that you created.
4. Set *SSL Inspection* to *certificate-inspection*.

The *no-inspection* profile does not perform SSL inspection, so it should not be selected with other UTM profiles.

5. Configure the other settings as needed.
6. Click **OK**.

Configuring a URL filter in the CLI

To create a URL filter for Facebook:

```
config webfilter urlfilter
  edit 1
    set name "webfilter"
    config entries
      edit 1
        set url "*facebook.com"
        set type wildcard
        set action block
      next
    end
  next
end
```

To apply the URL filter to a web filter profile:

```
config webfilter profile
  edit "webfilter"
    config web
      set urlfilter-table 1
    end
    config ftgd-wf
      ...
    end
  next
end
```

To apply the web filter profile to a firewall policy:

```

config firewall policy
  edit 1
    set name "WF"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set logtraffic all
    set webfilter-profile "webfilter"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end

```

Verifying the URL filter results

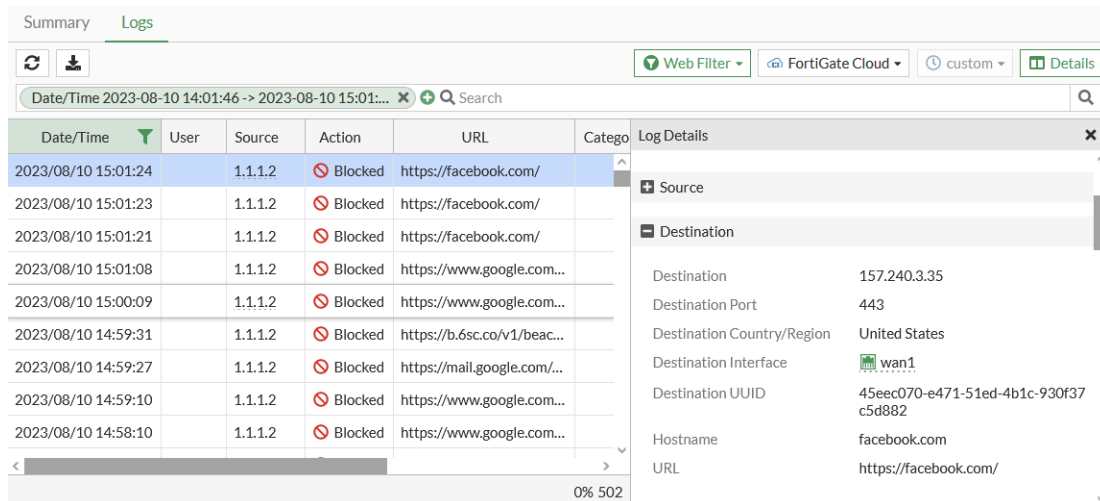

Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:

**To customize the URL web page blocked message:**

1. Go to *System > Replacement Messages*.
2. In the *HTTP* section, select *URL Block Page* and click *Edit*.
3. Edit the HTML to customize the message. See [Replacement messages on page 2671](#) for more information.

To check web filter logs in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *Web Filter* card name.
3. If there are a lot of log entries, click *Add Filter* and select *Event Type > urlfilter* to display logs generated by the URL filter.

Date/Time	User	Source	Action	URL	Category
2023/08/10 15:01:24		1.1.1.2	Blocked	https://facebook.com/	
2023/08/10 15:01:23		1.1.1.2	Blocked	https://facebook.com/

FortiGuard filter

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

The following actions are available:

FortiGuard web filter action	Description
Allow	Permit access to the sites in the category.
Monitor	Permit and log access to sites in the category. User quotas can be enabled for this option (see Usage quota on page 1495).
Block	Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.
Warning	Display a message to the user allowing them to continue if they choose.
Authenticate	Require the user to authenticate with the FortiGate before allowing access to the category or category group.
Disable	Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.

FortiGuard web filter categories

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:

FortiGuard web filter category	Where to find more information
All URL categories	See Web Filter Categories .
Local categories	See Web rating override on page 1748 .
Remote category	See Threat feeds on page 3099 .

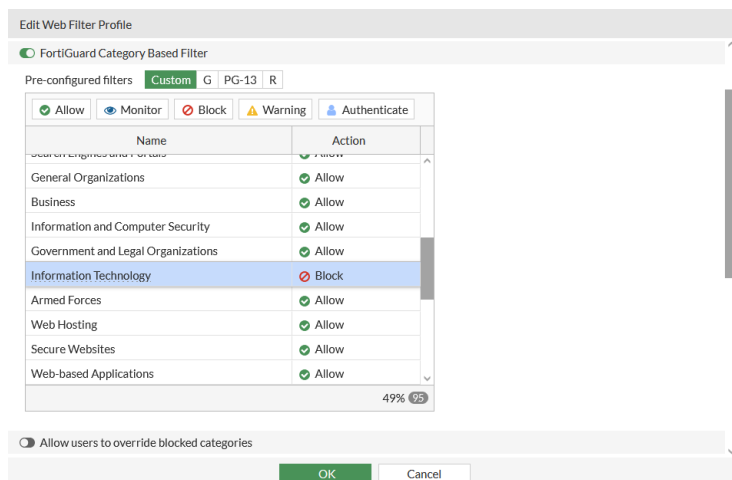

The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

Blocking a web category

The following example shows how to block a website based on its category. The Information Technology category (category 52) will be blocked.

To block a category in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Block*.

3. Configure the remaining settings as needed.
4. Click **OK**.

To block a category in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action block
        next
      end
    end
  next
end
```

To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com.
The page should be blocked and display a replacement message.

```

Allowing users to override blocked categories

There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. Enable *Allow users to override blocked categories*.
3. Enter information in the following fields:
 - *Groups that can override*
 - *Profile name*
 - *Switch applies to*
 - *Switch Duration*
4. Configure the other settings as needed.

5. Click **OK**.

To allow users to override blocked categories in the CLI:

```
config webfilter profile
  edit "webfilter"
    set ovr-d-perm bannedword-override urlfilter-override fortiguard-wf-override
  contenttype-check-override
    config override
      set ovr-d-user-group "radius_group"
      set profile "webfilter"
    end
  config ftgd-wf
    unset options
  end
next
end
```

Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (Information Technology, category 52).

To configure a warning for a category in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Warning*.
3. Set the *Warning Interval*, then click *OK*.

The warning interval is the amount of time until the warning appears again after the user proceeds past it.

4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a warning for a category in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action warning
        next
      end
    end
  next
end
```

To verify that the warning works:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed* or *Go Back*.

Authenticating a web category

The following example shows how to authenticate a website based on its category (Information Technology, category 52).

To authenticate a category in the GUI:

1. Go to *Security Profiles > Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Authenticate*.
3. Set the *Warning Interval* and select one or more user groups, then click *OK*.
4. Configure the remaining settings as needed.
5. Click *OK*.

To authenticate a category in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action authenticate
          set auth-usr-grp "local_group"
        next
      end
    end
  next
end
```

To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed*.

Customizing the replacement message page

When the category action is *Block*, *Warning*, or *Authenticate*, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to *Security Profiles > Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, right-click on a category and select *Customize*.
3. Select a *Replacement Message Group*. See [Replacement message groups on page 2674](#) for details.
4. Optionally, click *Edit FortiGuard Block Page* or *Edit FortiGuard Warning Page* to make modifications.
5. Click *Save*.
6. Configure the remaining settings as needed.
7. Click *OK*.

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the `domain controller`.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.
- The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.
- Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.
- The profile scans for pre-defined and custom username and password fields in the HTTP request, such as `username`, `auth`, and `password`. You can evaluate custom fields by configuring custom patterns.
- The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL filter and FortiGuard filters allow the traffic.
- If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
- Like firewall rules, the URL filter table and FortiGuard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

To configure credential phishing prevention:

1. Configure the corporate domain controller:

```
config user domain-controller
  edit "win2016"
    set hostname "win2016"
```

```
        set domain-name "corpserver.local"
        set username "Administrator"
        set password *****
        set ip <server_ip>
    next
end
```

The hostname and the domain-name are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

```
config webfilter profile
    edit <profile-name>
        set feature-set proxy
        ...
        config web
            ...
        end
        config antiphish
            set status enable
            set domain-controller "win2016"
            set default-action block
            set check-uri enable
            set check-basic-auth enable
            set max-body-len 65536
            config inspection-entries
                edit "inspect-37"
                    set fortiguard-category 37
                    set action block
                next
                edit "inspect-others"
                    set fortiguard-category all
                    set action log
                next
            end
            config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                    set category password
                next
            end
        end
        ...
        set web-antiphishing-log enable
    next
end
```

- `check-uri` enables support for scanning HTTP GET URI parameters.
- `check-basic-auth` enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs.

The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

```
config webfilter urlfilter
  edit 1
    set name "antiphish-table"
    config entries
      edit 1
        set url "www.example.com"
        set type simple
        set antiphish-action block
        set status enable
        set referrer-host ''
      next
    end
  next
end
config webfilter profile
  edit "<profile-name>"
    config web
      set urlfilter-table 1
    end
    ...
  next
end
```

4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```
config webfilter profile
  edit "<profile-name>"
    config custom-patterns
      edit "customer-name"
        set category username
      next
      edit "customer-passwd"
        set category password
      next
    end
  end
next
end
```

Additional antiphishing settings

The following settings are available for antiphishing:

- [Enable DNS service lookup in the domain controller so that the domain controller IP does not need to be configured.](#)
The DNS server will resolve the domain controller IP.
- [Specify a source IP or port for the fetching domain controller.](#)
- [Use an LDAP server as a credential source \(only the OpenLDAP server is supported\).](#)
- [Block or log valid usernames regardless of password match.](#)
- [Use literal custom patterns type for username and password.](#)
- [Active Directory Lightweight Directory Services \(AD LDS\) support](#)

Configuration examples

To enable DNS service lookup:

```
config user domain-controller
  edit "win2016"
    set ad-mode ds
    set dns-srv-lookup enable
    set hostname "win2016"
    set username "replicate"
    set password *****
    set domain-name "SMB2016.LAB"
  next
end
```

To specify the source IP and port for the fetching domain controller:

```
config user domain-controller
  edit "win2016"
    set ad-mode ds
    set hostname "win2016"
    set username "replicate"
    set password *****
    set ip-address 172.18.52.188
    set source-ip-address 172.16.100.1
    set source-port 2000
    set domain-name "SMB2016.LAB"
  next
end
```

To use an LDAP server as a credential store:

1. Configure the LDAP server:

```
config user ldap
  edit "openldap"
    set server "172.18.60.214"
    set cnid "cn"
    set dn "dc=qafsso,dc=com"
    set type regular
    set username "cn=Manager,dc=qafsso,dc=com"
    set password *****
    set antiphish enable
    set password-attr "userPassword"
  next
end
```

2. Configure the web filter profile:

```
config webfilter profile
  edit "webfilter"
    set feature-set proxy
    config ftgd-wf
      unset options
      config filters
```

```
        edit 1
            set action block
        next
    end
end
config antiphish
    set status enable
    config inspection-entries
        edit "cat34"
            set fortiguard-category 34
            set action block
        next
    end
    set authentication ldap
    set ldap "openldap"
end
set log-all-url enable
next
end
```

To configure username-only credential matching:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            set check-username-only enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

To configure different custom pattern types for usernames and passwords:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            config inspection-entries
```

```
        edit "cat34"
            set fortiguard-category 34
            set action block
        next
    end
    config custom-patterns
        edit "qwer"
            set type literal
        next
        edit "[0-6]Dat*"
        next
        edit "dauw9"
            set category password
            set type literal
        next
        edit "[0-5]foo[1-4]"
            set category password
        next
    end
    set domain-controller "win2016"
end
set log-all-url enable
next
end
```

In this example, the `qwer` and `dauw9` entries use the `literal` type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default `regex` type.

To configure Active Directory in LDS mode:

```
config user domain-controller
    edit "win2016adlds"
        set hostname "win2016adlds"
        set username "foo"
        set password *****
        set ip-address 192.168.10.9
        set domain-name "adlds.local"
        set ad-mode lds
        set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
        set adlds-ip-address 192.168.10.9
        set adlds-port 3890
    next
end
```

Usage quota

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the *Monitor*, *Warning*, or *Authenticate* actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.

Quotas are only available in proxy-based inspection mode.

Configuring a quota

The following example shows how to set a time quota for the education category (category 30).

To configure a quota in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. For *Feature set*, select *Proxy-based*.
3. In the *FortiGuard category based filter* section, scroll to the *General Interest - Personal* and click the + to expand the section.
4. Select *Education*, then click *Monitor*.

20% 95

Name	Action
Brokerage and Trading	Allow
Games	Allow
Web-based Email	Allow
Entertainment	Allow
Arts and Culture	Allow
Education	Monitor
Health and Wellness	Allow
Job Search	Allow
Medicine	Allow
News and Media	Allow

5. In the *Category Usage Quota* section, click *Create New*.
The *New/Edit Quota* pane opens.
6. In the *Category* field, select *Education*.
7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.

Category: Education

Quota Type: Time Traffic

Total quota: 0 hour(s) 5 minute(s) 0 second(s)

8. Click *OK*. The entry appears in the table.

Category Usage Quota

+ Create New Edit Delete

Category	Total quota
Education	5 minute(s)

OK Cancel

9. Configure the other settings as needed.
10. Click **OK**.

To configure a quota in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 30
        next
      end
    config quota
      edit 1
        set category 30
        set type time
        set duration 5m
      next
    end
  end
next
end
```

To verify the quota usage:

1. Go to a website that belongs to the education category, such <https://www.harvard.edu/>. You can view websites in that category at the moment.
2. In FortiOS, go to **Dashboard > FortiGuard Quota Monitor** to check the used and remaining time.

FortiGuard Quota

Reset Quota View Search

User	Used Traffic	Remaining
1.1.1.2	0 B	4 minutes and 57 seconds

Close

3. When the quota reaches its limit, traffic is blocked and the replacement page displays.

Web content filter

You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile. The maximum number of web content patterns in a list is 5000.

When configuring a web content filter list, the following patterns are available:

Web content pattern type	Description
Wildcard	Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as ? or * to represent one or more characters. For example, a wildcard expression <i>forti*.com</i> matches <i>fortinet.com</i> and <i>fortiguard.com</i> . The * represents any character appearing any number of times.
Regular expression	Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, <i>forti*.com</i> matches <i>fortiii.com</i> but not <i>fortinet.com</i> or <i>fortiice.com</i> . In this case, the symbol * represents <i>i</i> appearing any number of times.

Content evaluation

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table is an example of how rules are applied to the webpage contents. For example, a webpage contains only this sentence:

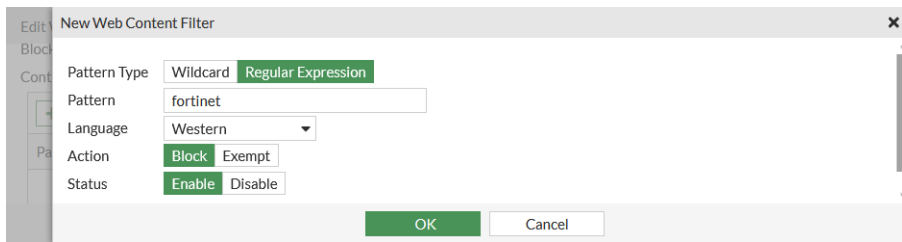

The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but is only counted once. The webpage is blocked.
word phrase	20	40	20	Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.
word sentence	20	20	20	<i>word</i> appears twice and <i>sentence</i> does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.
"word sentence"	20	0	20	This phrase does not appear exactly as written. The webpage is allowed.
"word or phrase"	20	20	20	This phrase appears twice but is only counted once. The webpage is blocked.

To configure a web content filter in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Content Filter*.
3. In the table, click *Create New*. The *New Web Content Filter* pane opens.
4. Configure the following settings:

Pattern Type	Regular Expression
Pattern	fortinet
Language	Western
Action	Block
Status	Enable

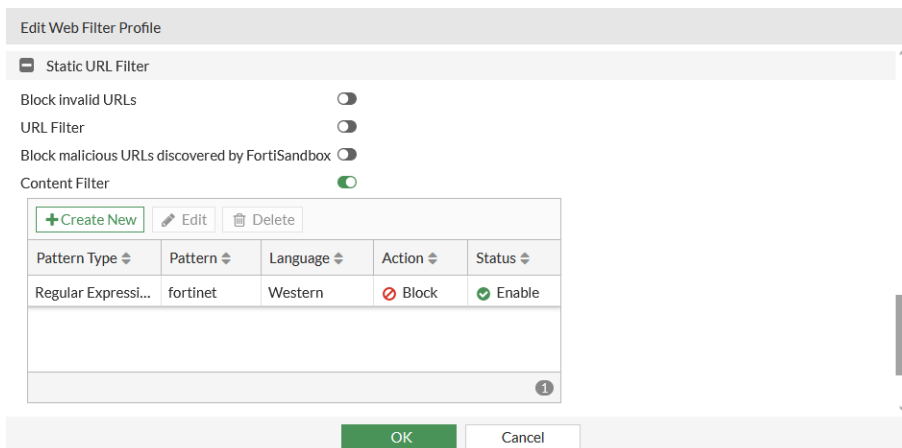

The 'New Web Content Filter' dialog box is shown. It has a sidebar on the left with 'Edit', 'Block', 'Content', and 'Pattern' options. The main area contains the following fields:

- Pattern Type:** Wildcard, Regular Expression (selected)
- Pattern:** fortinet
- Language:** Western
- Action:** Block, Exempt
- Status:** Enable, Disable

At the bottom are 'OK' and 'Cancel' buttons.

5. Click OK. The entry appears in the table.

The 'Edit Web Filter Profile' dialog box is shown. It has a sidebar on the left with 'Static URL Filter' selected. The main area contains the following settings:

- Block invalid URLs:** ☐
- URL Filter:** ☐
- Block malicious URLs discovered by FortiSandbox:** ☐
- Content Filter:** ☒

Below these settings is a table with columns: Pattern Type, Pattern, Language, Action, and Status. The table contains one entry:

Pattern Type	Pattern	Language	Action	Status
Regular Expressi...	fortinet	Western	Block	Enable

At the bottom are 'OK' and 'Cancel' buttons.

6. Configure the other settings as needed.
7. Click OK.

To configure a web content filter in the CLI:

1. Create the content (banned word) table:

```
config webfilter content
  edit 1
    set name "webfilter"
    config entries
      edit "fortinet"
        set pattern-type regexp
        set status enable
        set lang western
        set score 10
        set action block
      next
    end
  next
end
```

2. Apply the content table to the web filter profile:

```
config webfilter profile
  edit "webfilter"
    config web
      set bword-threshold 10
      set bword-table 1
    end
  config ftgd-wf
```

```
        unset options
    end
next
end
```

To verify the content filter:

1. Go to a website with the word *fortinet*, such as www.fortinet.com.
The website is blocked and a replacement page displays:

Attention

The page has been blocked because it contains a banned word.

URL <https://www.fortinet.com/>

Advanced filters 1

This topic gives examples of the following advanced filter features:

- [Block malicious URLs discovered by FortiSandbox on page 1501](#)
- [Allow websites when a rating error occurs on page 1502](#)
- [Rate URLs by domain and IP address on page 1502](#)
- [Block invalid URLs on page 1503](#)

Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see [Using FortiSandbox post-transfer scanning with antivirus on page 1459](#) and [Using FortiSandbox inline scanning with antivirus on page 1461](#).

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block malicious URLs discovered by FortiSandbox*.

3. Click **OK**.

To block malicious URLs discovered by FortiSandbox in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set blocklist enable
        end
    next
end
```

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Allow websites when a rating error occurs*.
3. Click **OK**.

To allow websites with rating errors in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options error-allow
        end
    next
end
```

Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

For example, if we use a spoof IP of Google as `www.irs.gov`, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to `www.irs.gov`. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Rate URLs by domain and IP address*.
3. Click *OK*.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options rate-server-ip
        end
    next
end
```

Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as `%20` in the URL path.

To block invalid URLs in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block invalid URLs*.

3. Click *OK*.

To block invalid URLs in the CLI:

```
config webfilter profile
    edit "webfilter"
        set options block-invalid-url
    next
end
```

Advanced filters 2

This topic gives examples of the following advanced filter features:

- [Safe search on page 1504](#)
- [Restrict YouTube access on page 1505](#)
- [Log all search keywords on page 1506](#)
- [Restrict Google account usage to specific domains on page 1506](#)
- [HTTP POST action on page 1507](#)
- [Remove Java applets, ActiveX, and cookies on page 1507](#)

These advanced filters are only available in proxy-based inspection mode.

Safe search

This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

To enable safe search in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex*.

3. Click *OK*.

To enable safe search in the CLI:

```
config webfilter profile
  edit "webfilter"
    config web
      set safe-search url header
    end
  next
end
```

Restrict YouTube access

The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see [Restrict YouTube content available to users](#) and [Manage your organization's YouTube settings](#) for more information). Google defines the restricted YouTube access modes as follows:

- **Strict Restricted YouTube access:** this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- **Moderate Restricted YouTube access:** this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

To restrict YouTube access in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Restrict YouTube Access* and select either *Strict* or *Moderate*.

3. Click *OK*.

To restrict YouTube access in the CLI:

```
config webfilter profile
  edit <name>
    config web
      set youtube-restrict {none | strict | moderate}
    end
  next
end
```

Vimeo access

The file filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.

To restrict Vimeo access:

```
config webfilter profile
  edit <name>
    config web
      set vimeo-restrict {7 | 134}
    end
  next
end
```

```
vimeo-restrict {7 | 134}
```

Set the Vimeo restriction:

- 7: do not show mature content
- 134: do not show unrated and mature content

Log all search keywords

Use this setting to log all search phrases.

To enable logging search keywords in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Log all search keywords*.
3. Click *OK*.

To enable logging search keywords in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set log-search enable
        end
    next
end
```

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, enable *Restrict Google account usage to specific domains*.
3. Click the + and enter the domains that Google can access, such as *www.fortinet.com*.

Edit Web Filter Profile

Proxy Options

Restrict Google account usage to specific domains ☒

Domain 1

HTTP POST Action

Remove Java Applets ☐

Remove ActiveX ☐

Remove Cookies ☐

4. Click *OK*.

When you try to use Google services like Gmail, only traffic from the domain of *www.fortinet.com* can go through. Traffic from other domains is blocked.

HTTP POST action

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

To configure HTTP POST in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, for *HTTP POST Action*, select *Allow* or *Block*.
3. Click *OK*.

To configure HTTP POST in the CLI:

```
config webfilter profile
  edit "webfilter"
    set post-action {normal | block}
    config ftgd-wf
      unset options
    end
  next
end
```

Remove Java applets, ActiveX, and cookies

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

To enable these filters in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile. and go to the *Proxy Options* section.
2. In the *Proxy Options* section, enabled the filters you want to use: *Remove Java Applets*, *Remove ActiveX*, or *Remove Cookies*.

To enable these filters in the CLI:

```
config webfilter profile
  edit "webfilter"
    set options {activexfilter cookiefilter javafilter}
    config ftgd-wf
      unset options
    end
  next
end
```

```
        end
    next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop_unknown_session is enabled.

(global) # diagnose wad stats filter list
filtering of vdom root
  dlp                = 0
  content-type       = 0
  urls:
    examined = 6
    allowed  = 3
    blocked  = 0
    logged   = 0
    overridden = 0

(global) # diagnose wad filter vd vdom1
(global) # diagnose wad stats filter list
filtering of vdom vdom1
  dlp                = 0
  content-type       = 0
  urls:
    examined = 13
    allowed  = 2
    blocked  = 9
    logged   = 8
    overridden = 0

(global) # diagnose wad filter vd ALL
(global) # diagnose wad stats filter list
filtering of all accessible vdoms
  dlp                = 0
  content-type       = 0
  urls:
    examined = 19
    allowed  = 5
    blocked  = 9
```

```
logged = 8
overridden = 0
```

Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
request:    9474
blocked:    8606
allowed:    868
overridden:0
logged:     8606
pending:    0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```
config vdom
  edit <vdom>
    config firewall ssl-ssh-profile
      edit "certificate-inspection"
        set block-blocklisted-certificates enable
      next
      edit "deep-inspection"
        set block-blocklisted-certificates enable
      next
    end
  next
end
```

Websense Integrated Services Protocol

Websense Integrated Services Protocol (WISP) servers can be used server, which allows the FortiGate to send traffic to the third-party web filtering service for rating and approval checking.

When WISP is enabled, the FortiGate maintains a pool of TCP connections to the WISP server. The TCP connections are used to forward HTTP request information and log information to the WISP server and receive policy decisions.

When a WISP server is used in a web filter profile, in flow or proxy mode, the following web filter scanning priority sequence is used:

1. Local URL filter
2. Websense web filtering service
3. FortiGuard web filtering service

The following example uses a WISP server configured in a flow mode web filter profile.

To use a WISP server in flow mode:

1. Configure the WISP servers:

```
config web-proxy wisp
  edit "wisp1"
    set server-ip 10.2.3.4
  next
  edit "wisp2"
    set server-ip 10.2.3.5
  next
  edit "wisp3"
    set server-ip 192.168.1.2
  next
  edit "wisp4"
    set server-ip 192.168.3.4
  next
end
```

2. Configure the web filter profile:

```
config webfilter profile
  edit "webfilter_flowbase"
    set feature-set flow
    config ftgd-wf
      unset options
      config filters
        edit 64
          set category 64
          set action block
        next
      end
    end
    set wisp enable
    set wisp-servers "wisp1" "wisp2"
    set wisp-algorithm {primary-secondary | round-robin | auto-learning}
    set log-all-url enable
  next
end
```

Inspecting HTTP3 traffic

HTTP/3 traffic can be inspected on the FortiGate in flow mode inspection.

When using Chrome, the browser may switch the HTTP/3 connection to HTTP/2 when deep inspection is applied, due to its sensitivity to delays caused by deep inspection.

Example

In this example, a web filter profile is created to block the words *Welcome to aioquic*, which appear in a website that uses HTTP/3.

To block content in HTTP/3 traffic:

1. Configure the web filter banned word table:

```
config webfilter content
  edit 1
    set name "aioquic"
    config entries
      edit "Welcome to aioquic"
        set status enable
      next
    end
  next
end
```

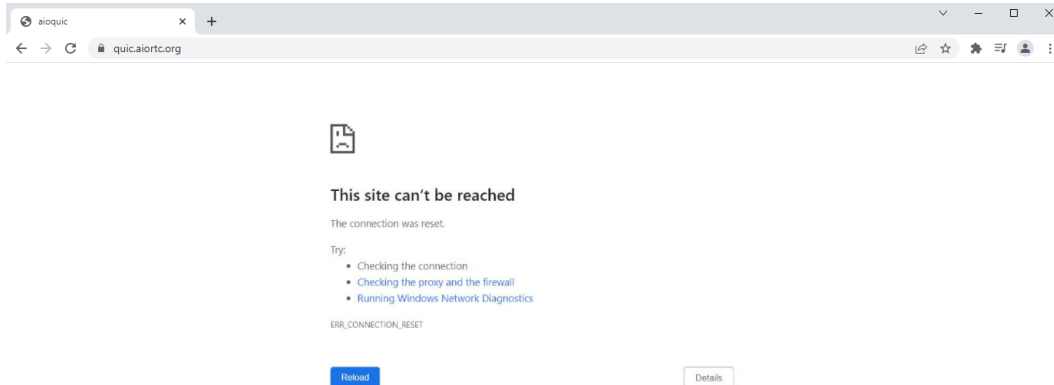

2. Apply the banned word table in the web filter profile:

```
config webfilter profile
  edit "flow-webfilter"
    config web
      set bword-table 1
    end
    config ftgd-wf
      unset options
    end
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set utm-status enable
    set ssl-ssh-profile "deep-inspection"
    set webfilter-profile "flow-webfilter"
    set logtraffic all
    set nat enable
  next
end
```

4. Access the website using a supported HTTP/3 client, such as Chrome or Firefox. The website is blocked by the FortiGate.

Configuring web filter profiles with Hebrew domain names

The domain name URLs in web filter profiles can be configured with non-ASCII characters, such as in Hebrew. Any configured domain name in non-ASCII characters is encoded into Punycode format, then the domain name in Punycode format is used to match the domain name in the HTTP request for URL filtering purposes.

In the following example, a Hebrew URL (איגוד-האינטרנט.ישראל) is blocked in by a static URL filter. The URL translates to:

- xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce in Punycode
- en.isoc.org.il in English

To configure the web filter profile in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*.
2. Enter a profile *Name*.
3. In the *Static URL Filter* section, enable *URL Filter* and click *Create New*.
4. Enter the Hebrew URL and set the *Action* to *Block*. The URL can be entered in Hebrew.

5. Click *OK* to save the filter. The URL appears in Hebrew in the URL filter table.

Edit Web Filter Profile

Static URL Filter

Block invalid URLs ☐

URL Filter ☒

URL	Type	Action	Status
איגוד-האינטרנט-ישראל	Simple	Block	Enable

Block malicious URLs discovered by FortiSandbox ☐

OK Cancel

6. Click OK to save the web filter profile.

7. Edit the web filter profile. The URL in the table has been converted by the FortiGate into Punycode.

Edit Web Filter Profile

Static URL Filter

Block invalid URLs ☐

URL Filter ☒

URL	Type	Action	Status
xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce	Simple	Block	Enable

Block malicious URLs discovered by FortiSandbox ☐

OK Cancel

In the CLI, Punycode must be used to configure the Hebrew URL.

To configure the web filter profile in the CLI:

```
config webfilter urlfilter
  edit 1
    set name "Auto-webfilter-urlfilter_0wedo5flc"
    config entries
      edit 1
        set url "xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce"
        set action block
      next
    end
  next
end
```

To verify the configuration:

1. From a client, access the Hebrew URL over HTTPS. The website is blocked by the FortiGate.
2. The content of the replacement message displayed in the browser depends on the inspection mode.

- In flow mode (current configuration), the URL is displayed in Hebrew.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

The page you have requested has been blocked because the URL is banned.

URL `http://איגוד-האינטרנט-ישראל/`
 Description
 URL Source Local URLfilter Block

- In proxy mode, the URL is displayed in Punycode.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

The page you have requested has been blocked because the URL is banned.

URL `http://xn---zhcbgfne2aaag8fb5i.xn--4dbrk0ce/`
 Description
 URL Source Local URLfilter Block

To verify the logs:

1. Go to **Log & Report > Security Events** and select the **Web Filter** card.
2. Select a log and click **Details**. The format of the **Hostname** and **URL** fields depends on the inspection mode.
 - In flow mode, the **Hostname** is displayed in Punycode with Hebrew in parentheses. The **URL** is displayed Punycode.

Summary						Logs
<div> <div> <div></div> <div></div> <div></div> </div> <div> <div>Search</div> <div></div> </div> </div> <div> <div>Web Filter</div> <div>Disk</div> <div>1 hour</div> <div>Details</div> </div>

If a FortiGuard category-based filter is configured in a web filter profile, the same behavior for replacement messages and logs applies based on the inspection mode.

Video filter

The video filter profile can be used to filter YouTube videos based on FortiGuard categories or by channel ID for a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

Configuring a video filter profile

In the GUI, there are two main sections on the *New Video Filter Profile* page (*Security Profiles > Video Filter*), *FortiGuard Category Based Filter* and *Channel override list*.

When *FortiGuard Category Based Filter* is enabled, the various FortiGuard categories can be set to allow, monitor, or block videos in those categories. See [Filtering based on FortiGuard categories on page 1517](#) for a detailed example and explanation of how the WAD daemon inspects videos.

The YouTube *Channel override list* can be used to filter specific YouTube channels. When a video matches a YouTube channel, the video filter will take the corresponding action of allow, monitor, or block. See [Filtering based on YouTube channel on page 1522](#) for a detailed example.

By default, when the FortiGuard category-based filter and YouTube channel override are used together, a video will be blocked if it matches either category or YouTube channel and the action is set to block.

Filtering based on FortiGuard categories

Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (`vid`) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the `videofilter.youtube-key` to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user's own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In the following example, a new video filter profile is created to block the Knowledge category.

Many Google services use the QUIC protocol on UDP/443. FortiOS can detect and inspect QUIC traffic in HTTP3, so QUIC is not blocked by default in application control profiles. QUIC can be blocked manually (see [Blocking QUIC manually on page 1571](#)) in application control profiles, such as in scenarios where the traffic uses HTTP2 over QUIC. Blocking QUIC will cause the traffic to fall back to TCP/443 without QUIC, and the FortiGate can successfully inspect the traffic.

To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
 - a. Go to *Security Profiles > Video Filter* and click *Create New*.
 - b. Enter a name (*category_filter*).
 - c. In the *FortiGuard Category Based Filter* section, set the *Knowledge* category *Action* to *Block*.
 - d. Click *OK*.
2. Create the firewall policy:
 - a. Enter the following:

Incoming Interface	port2
Outgoing Interface	port1
Source	All
Destination	All
Service	All
Inspection Mode	Proxy-based
NAT	Enable
Video Filter	Enable and select <i>category_filter</i>
Application Control	Enable and select <i>default</i>
SSL Inspection	deep-inspection
Log Allowed Traffic	All Sessions

- b. Configure the other settings as needed and click *OK*.

To configure a video filter based on FortiGuard categories in the CLI:**1. Create the video filter profile:**

```
config videofilter profile
  edit "category_filter"
    config fortiguard-category
      edit 5
        set action block
        set category-id 4
        set log enable
      next
    end
  next
end
```

2. Create the firewall policy:

```
config firewall policy
  edit 10
    set name "client_yt_v4"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set application-list "default"
    set videofilter-profile "category_filter"
    set logtraffic all
    set nat enable
  next
end
```

To configure the YouTube API key (optional):

```
config videofilter youtube-key
  edit 1
    set key *****
    set status enable
  next
end
```

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear. This replacement message says the URL is blocked, and displays the URL of the YouTube video. On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log

```
2: date=2021-04-27 time=15:27:13 eventtime=1619562433424944288 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.11 srcport=60628
srcintf="port2" srcintfrole="undefined" dstip=172.217.3.206 dstport=443 dstintf="port1"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" sessionid=8230
proto=6 action="client-rst" policyid=10 policytype="policy" poluuid="a5e991ba-a799-51eb-
4efe-ce32b9f70b75" policyname="client_yt_v4" service="HTTPS" trandisp="snat"

rcvpkt=34 appcat="unscanned" wanin=2152 wanout=2290 lanin=2000 lanout=2000
utmaction="block" countweb=3 utmref=65532-0
```

Sample web filter log

```
1: date=2021-04-27 time=15:25:37 eventtime=1619562338128550236 tz="-0700" logid="0347013664"
type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="vdom1"
msg="Video category is blocked." policyid=10 sessionid=8230 srcip=10.1.100.11
dstip=172.217.3.206 srcport=60628 dstport=443 srcintf="port2" srcintfrole="undefined"
dstintf="port1" dstintfrole="undefined" proto=6 service="HTTPS" action="blocked"
videoinfosource="Cache" profile="category_filter" videoid="EAyo3_zJj5c" videocategoryid=4
hostname="www.youtube.com" url="https://www.youtube.com/watch?v=EAyo3_zJj5c"
```

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

```
# get system fortiguard

fortiguard-anycast : enable
fortiguard-anycast-source: debug
protocol           : https
port               : 443
...
webfilter-license  : Contract
webfilter-expiration: Fri Dec 13 2030
...
videofilter-license : Contract
videofilter-expiration: Fri Dec 13 2030
```

The videofilter license should be synchronized with the webfilter license.

To verify the WAD worker is running:

```
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
              diagnosis=no debug=enable valgrind=supported/disabled
...
Process [6]: type=YouTube-filter-cache-service(9) index=0 pid=290 state=running
              diagnosis=no debug=enable valgrind=unsupported/disabled
...
```

To display and debug video filter cache:

```
# diagnose test app wad ?
....
321: Display Video Filter Cache stats.
322: Reset Video Filter Cache stats.
323: Flush Video Filter Cache entries.
324: Display Video Filter module stats.
325: Request category list from Youtube API.
326: Display FTGD agent module stats.
327: Reset FTGD agent module stats.
328: Toggle Video Filter Cache Check.
329: Toggle Video Filter FTGD Query.
330: Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```

Filtering based on YouTube channel

Video filtering can be configured to filter specific YouTube channels. When a video matches a YouTube channel, the video will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

By default, when the FortiGuard category-based filter and YouTube channel override are used together, a video will be blocked if it matches either category or YouTube channel and the action is set to block.

The *Channel override list* allows the channel action to override the category action. A category can be blocked, but certain channels in that category can be allowed (see [Configuration with YouTube channel override](#)).

Videos are first filtered by channel action. If no match is found, then the category action is checked. If neither condition is met, the default action in the video filter profile is used.

Identifying the YouTube channel ID

The following table lists how to identify the YouTube channel ID based on different YouTube video URLs formats:

Video URL	Channel ID
www.youtube.com/channel/<channel-id>	<channel-id> indicates the ID for the channel.
www.youtube.com/user/<user-id>	Open the page source and locate: <meta itemprop="channelId" content="<channel-id>"> <channel-id> indicates the channel ID for the user page.
www.youtube.com/watch?v=<string>	Open the page source and locate: <meta itemprop="channelId" content="<channel-id>"> <channel-id> indicates the channel ID for the video.

In a video filter profile, the default action is set to monitor when there is no match. Logging is enabled by default.

```
config videofilter profile
  edit <name>
    set default-action {block | monitor | allow}
    set log {enable | disable}
  next
end
```

Basic configuration

In the following example, the Fortinet YouTube channel ID (UCJHo4AuVomwMRzgkA5DQEOA) is blocked, and the video filter is applied to a policy.

To configure a video filter based on a YouTube channel in the GUI:

1. Go to *Security Profiles > Video Filter* and click *Create New*.
2. In the *Channel override list* section, click *Create New*. The *New Channel Override Entry* pane opens.
 - a. Enter the *Channel ID* (UCJHo4AuVomwMRzgkA5DQEOA) and for *Action*, select *Block*.

- b. Click *OK*.
3. Click *OK*.
4. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Inspection Mode*, select *Proxy-based*.
 - c. Enable *Video Filter* and select the profile you created.
 - d. For *SSL Inspection*, select *deep-inspection*.

- e. Configure the other settings as needed and click *OK*.

To configure a video filter based on a YouTube channel in the CLI:

1. Configure the channel filter:

```
config videofilter youtube-channel-filter
  edit 1
    set name "channel_filter"
    set log enable
    config entries
      edit 1
        set action block
        set channel-id "UCJHo4AuVomwMRzgkA5DQEOA"
      next
    end
  next
end
```

2. Configure the video filter profile:

```
config videofilter profile
  edit "channel_filter"
    set default-action monitor
    set log enable
    set youtube-channel-filter 1
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set name "video-filter"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set videofilter-profile "channel_filter"
    set nat disable
  next
end
```

Configuration with YouTube channel override

In this example, all categories in the video filter are configured to be blocked. The YouTube channel filter list is configured with the action set to allow, which effectively creates an allowlist. The channel UCR6d0EiC3G4WA8-Rqji6a8g is allowed.

To configure YouTube channel override in the GUI:

1. Go to *Security Profiles > Video Filter* and click *Create New*.
2. In the *Channel override list* section, click *Create New*. The *New Channel Override Entry* pane opens.
 - a. Enter the *Channel ID* (UCJHo4AuVomwMRzgkA5DQEOA) and for *Action*, select *Allow*.
 - b. Click *OK*.
3. In the *FortiGuard Category Based Filter* section, set the *Action* for all categories to *Block*.
4. Click *OK*.
5. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Inspection Mode*, select *Proxy-based*.
 - c. Enable *Video Filter* and select the profile you created.
 - d. For *SSL Inspection*, select *deep-inspection*.
 - e. Configure the other settings as needed and click *OK*.

To configure YouTube channel override in the CLI:

1. Configure the YouTube channel filter:

```
config videofilter youtube-channel-filter
  edit 1
    set name "vf1"
    config entries
      edit 1
        set comment "https://www.youtube.com/watch_v=EAYo3_zJj5c"
        set action allow
        set channel-id "UCR6d0EiC3G4WA8-Rqji6a8g"
      next
    end
    set log enable
  next
end
```

2. Configure the video filter profile:

```
config videofilter profile
  edit "channel_filter_override"
    set default-action monitor
    set log enable
    set youtube-channel-filter 1
    config fortiguard-category
      config filters
        edit 1
          set action block
          set log enable
        next
        edit 2
          set action block
          set category-id 1
          set log enable
        next
        edit 3
          set action block
          set category-id 2
      next
    end
  end
```

```
        set log enable
    next
    edit 4
        set action block
        set category-id 3
        set log enable
    next
    edit 5
        set action block
        set category-id 4
        set log enable
    next
    edit 6
        set action block
        set category-id 5
        set log enable
    next
    edit 7
        set action block
        set category-id 6
        set log enable
    next
    edit 8
        set action block
        set category-id 7
        set log enable
    next
    edit 9
        set action block
        set category-id 8
        set log enable
    next
    edit 10
        set action block
        set category-id 9
        set log enable
    next
    edit 11
        set action block
        set category-id 10
        set log enable
    next
end
end
next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 10
        set name "client_yt_v4"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
```

```

set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set ssl-ssh-profile "deep-inspection"
set videofilter-profile "channel_filter_override"
set logtraffic all
set nat enable
next
end

```

4. Verify the logs. The category action is set to `block` and the channel action is set to `allow`, so video access is allowed:

```

30: date=2023-05-03 time=16:38:41 eventtime=1683157121226033191 tz="-0700"
logid="0348013682" type="utm" subtype="webfilter" eventtype="videofilter-channel"

7881%2C24550458%2C24559266%2C24691625%2C39323074&c1=528338113&seq=3&docid=EAyo3_
zJj5c&ei=VvBSZIBxI4_Ckgaa6aW4Dw&event=streamingstats&plid=AAx60ovFxSwqcWr-&cbr=Chrom"

```

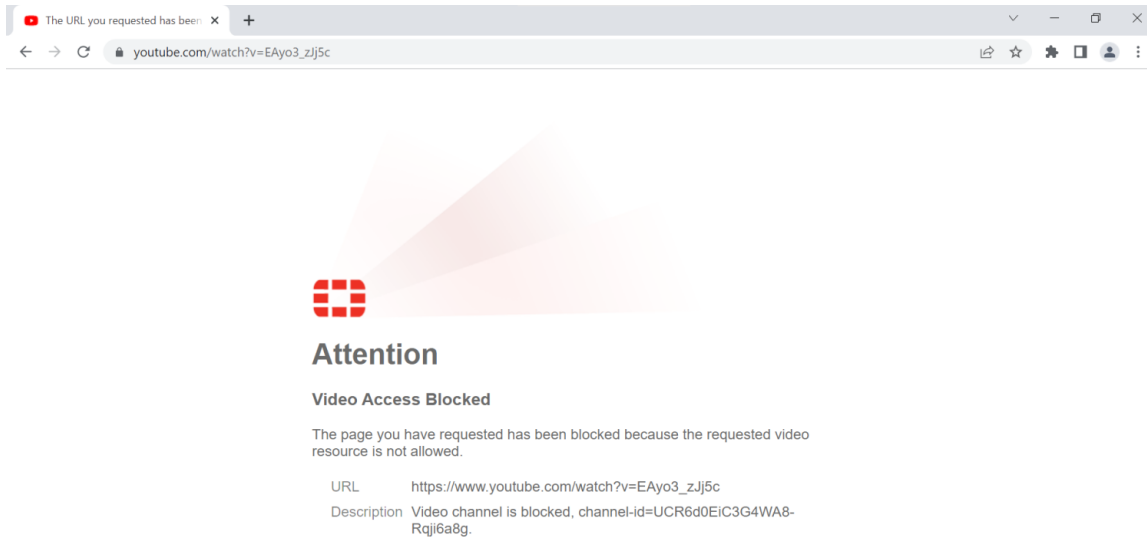

If the category action is changed to `allow` and the channel action is changed to `block`, the video access would be blocked.

Replacement messages displayed in blocked videos

When a user visits a video directly by a URL, a full page replacement message is displayed. When a user loads a video from the YouTube website (homepage or recommended videos), the page loads and the replacement message is displayed in the video frame. For more information about configuring video filters, see [Filtering based on FortiGuard categories on page 1517](#) and [Filtering based on YouTube channel on page 1522](#).

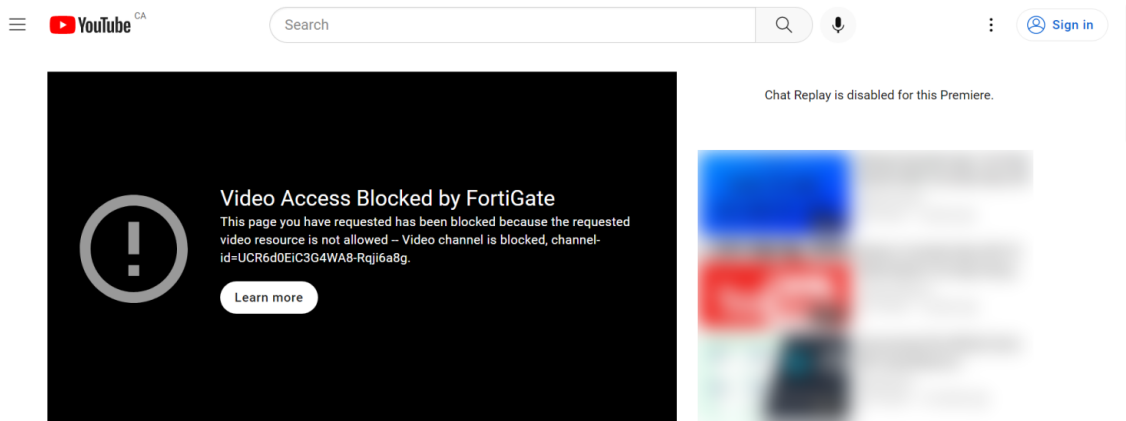

Example 1: blocking the video based on the URL

In this example, the user entered the URL of a blocked channel ID in their browser. The replacement message is displayed in the browser (full page).

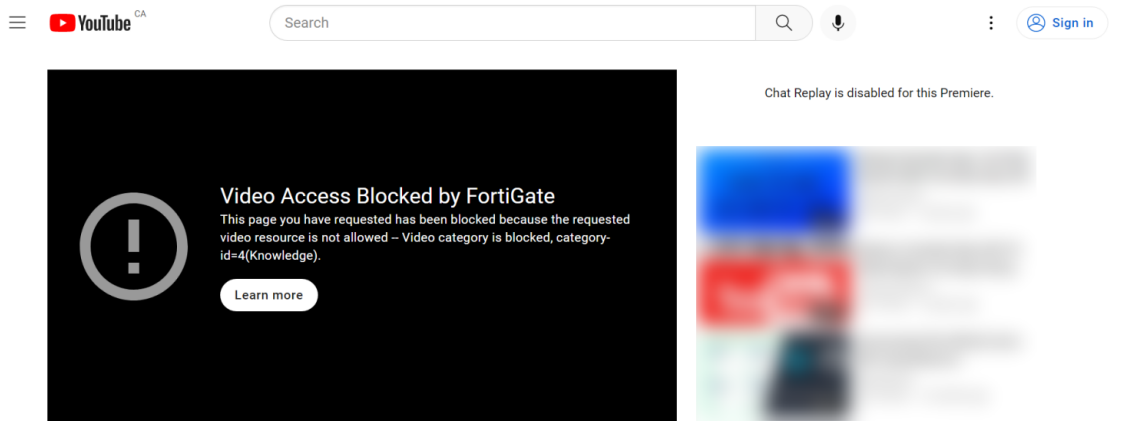

Example 2: blocking the video based on channel ID on YouTube

In this example, the user visited a blocked channel ID on the YouTube website. The replacement message is displayed in the video frame.

Example 3: blocking the video based on FortiGuard category on YouTube

In this example, the user visited a video on the YouTube website that belongs to a blocked FortiGuard category. The replacement message is displayed in the video frame.

DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see [DNS on page 268](#).

When both a DNS and a web filter are configured on a firewall policy, the DNS filter takes precedence. If certificate inspection is also used, the web filter replacement message might be shown instead of the SDNS block page. If both filters are set to block, SSL inspection is set to certificate inspection, and the destination web traffic is HTTPS, then the client receives a redirect to the SDNS server, which is then blocked by the web filter because the redirect URL cannot pass the certificate inspection.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filter: allows you to define your own domain list to block or allow.
- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
- DNS translation: maps the resolved result to another IP that you define.

Some DNS filter features require a subscription to FortiGuard Web Filtering.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see [DNS over TLS and HTTPS on page 282](#).

The IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

DNS filter profiles cannot be used in firewall policies when the FortiGate is in NGFW policy-based mode; see [NGFW policy on page 1192](#) for more information. They can be used in the DNS server; see [FortiGate DNS server on page 274](#) for more information.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1531](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1551](#)).

DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in the preceding section) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```
config system dns
    set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source fortinet
    set anycast-sdns-server-ip 0.0.0.0
    set anycast-sdns-server-port 853
end
```

The following topics provide information about DNS filters:

- [Configuring a DNS filter profile on page 1531](#)
- [FortiGuard category-based DNS domain filtering on page 1535](#)
- [Botnet C&C domain blocking on page 1538](#)
- [DNS safe search on page 1541](#)
- [Local domain filter on page 1543](#)
- [DNS translation on page 1548](#)
- [Applying DNS filter to FortiGate DNS server on page 1551](#)
- [DNS inspection with DoT and DoH on page 1552](#)
- [Troubleshooting for DNS filter on page 1555](#)

Configuring a DNS filter profile

A DNS filter profile contains settings that enable or disable various forms of DNS filtering, including:

- FortiGuard filtering
- Botnet C&C domain blocking
- DNS safe search
- External dynamic category domain filtering
- Local domain filter
- External IP block list
- DNS translation

Once a DNS filter is configured, it can be applied to a firewall policy, or on a FortiGate DNS server if one is configured. In the following basic example, a DNS filter is created and applied to a firewall policy to scan DNS queries that pass through the FortiGate.

To configure a DNS filter profile in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Configure the settings as needed.

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).
<i>Redirect botnet C&C requests to Block Portal</i>	Enable to block botnet website access at the DNS name resolution stage. See Botnet C&C domain blocking on page 1538 for more details.
<i>Enforce 'Safe Search' on Google, Bing, YouTube</i>	Enable to avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. See DNS safe search on page 1541 for more details.
<i>Restrict YouTube Access</i>	When <i>Enforce 'Safe Search' on Google, Bing, YouTube</i> is enabled, select either <i>Strict</i> or <i>Moderate</i> to restrict YouTube access by responding to DNS resolutions with CNAME restrict.youtube.com and restrictmoderate.youtube.com respectively.
<i>FortiGuard Category Based Filter</i>	Enable to use the FortiGuard domain rating database to inspect DNS traffic. A FortiGuard Web Filter license is required to use this option.

	Expand the category groups in the table to view and edit the FortiGuard category settings to <i>Allow</i> , <i>Monitor</i> , or <i>Redirect to Block Portal</i> . See FortiGuard category-based DNS domain filtering on page 1535 for more details.
Static Domain Filter	This section includes options related to the static domain filter.
<i>Domain Filter</i>	<p>Enable to define local static domain filters to allow or block specific domains. The local domain filter has a higher priority than the FortiGuard category-based domain filter.</p> <p>Click <i>Create New</i> in the table to add a domain filter and configure the following settings.</p> <ul style="list-style-type: none"> • <i>Domain</i>: enter a domain. • <i>Type</i>: select <i>Simple</i>, <i>Reg. Expression</i>, or <i>Wildcard</i>. • <i>Action</i>: select <i>Redirect to Block Portal</i>, <i>Allow</i>, or <i>Monitor</i>. • <i>Status</i>: select <i>Enable</i> or <i>Disable</i>. <p>See Local domain filter on page 1543 for more details.</p>
<i>External IP Block Lists</i>	Enable to add one or more external IP block lists. See IP address threat feed on page 3112 for more details.
<i>DNS Translation</i>	<p>Enable to translate a DNS resolved IP address to another IP address specified on a per-policy basis.</p> <p>Click <i>Create New</i> in the table to add a DNS translation and configure the following settings.</p> <ul style="list-style-type: none"> • <i>Type</i>: select <i>IPv4</i> or <i>IPv6</i>. • <i>Original Destination</i>: enter the address of a host or subnet that you want translated. When a resolved address in a DNS response matches this destination, the FortiGate will replace the address with the address in <i>Translated Destination</i>. • <i>Translated Destination</i>: enter the address of a host or subnet that you want the resolved address to be translated to. • <i>Network Mask</i>: enter the netmask for the original and translated destination. If a single host is used for the original and translated destination, set the netmask to <i>255.255.255.255</i>. • <i>Status</i>: select <i>Enable</i> or <i>Disable</i>. <p>Enabling DNS translation will override matching DNS responses with translated IPs. See DNS translation on page 1548 for more details.</p>
Options	This section includes other options related to the DNS filter.
<i>Redirect Portal IP</i>	<p>Set the IP address of the SDNS redirect portal. Select <i>Use FortiGuard Default</i>, or <i>Specify</i> and enter the IP address.</p> <p>When <i>FortiGuard Category Based Filter</i> categories are set to <i>Redirect to Block Portal</i>, the DNS response will use this IP address in its response to the client. If the client is accessing the domain on a web browser, they will be redirected to the block portal page on this address.</p>

Allow DNS requests when a rating error occurs

Enable to allow all domains when FortiGuard DNS servers fail, or they are unreachable from the FortiGate. When this happens, a log message is recorded in the DNS logs by default.

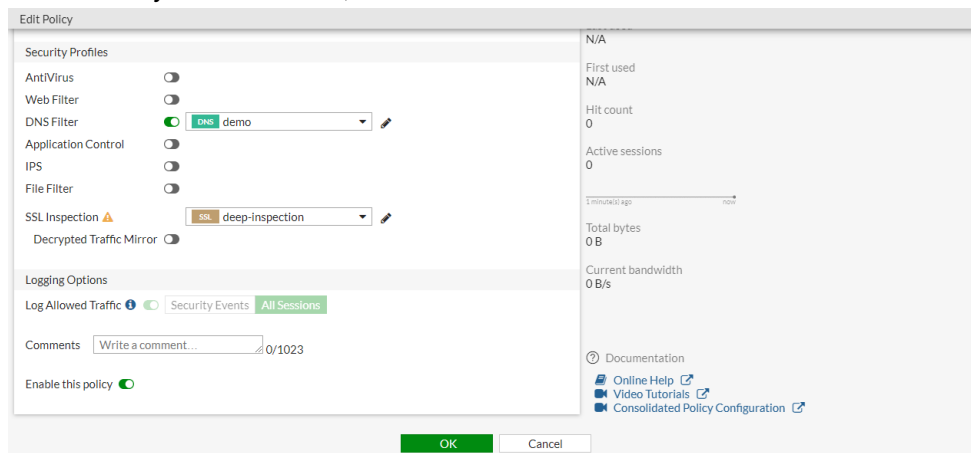

Log all DNS queries and responses

Enable to log all domains visited (detailed DNS logging).

3. Click **OK**.

To apply a DNS filter profile to a policy in the GUI:

1. Go to **Policy & Objects > Firewall Policy** and click **Create New**, or edit an existing policy.
2. In the **Security Profiles** section, enable **DNS Filter** and select the DNS filter.

3. Configure the other settings as needed.
4. Click **OK**.

CLI-only settings

The following DNS filter profile settings can only be configured in the CLI:

```
config dnsfilter profile
  edit <name>
    set block-action {block | redirect | block-servfail}
    set sdns-ftgd-err-log {enable | disable}
  next
end
```

```
block-action {block |
  redirect | block-
  servfail}
```

Set the action to take for blocked domains:

- **block**: return NXDOMAIN for blocked domains.
- **redirect**: redirect blocked domains to SDNS portal (default).
- **block-servfail**: return SERVFAIL for blocked domains.

When a FortiGuard or local domain filter category is set to **Redirect to Block Portal** in the GUI, the action is set to **block** in the CLI. By default, the **block-action** applied to a DNS profile is set to **redirect**.

```
sdns-ftgd-err-log {enable
  | disable}
```

Enable/disable FortiGuard SDNS rating error logging (default = enable).

To configure a DNS filter profile in the CLI:

```
config dnsfilter profile
  edit "demo"
    set comment ''
    config domain-filter
      unset domain-filter-table
    end
    config ftgd-dns
      set options error-allow
      config filters
        edit 2
          set category 2
          set action monitor
        next
        edit 7
          set category 7
          set action block
        next
        ...
        edit 22
          set category 0
          set action monitor
        next
      end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action redirect
    set block-botnet enable
    set safe-search enable
    set redirect-portal 93.184.216.34
    set youtube-restrict strict
  next
end
```

To apply a DNS filter profile to a policy in the CLI:

```
config firewall policy
  edit 1
    set name "Demo"
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set logtraffic all
    set fsso disable
    set dnsfilter-profile "demo"
    set profile-protocol-options "default"
    set ssl-ssh-profile "deep-inspection"
```

```

    set nat enable
  next
end

```

FortiGuard category-based DNS domain filtering

You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1531](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1551](#)).

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *FortiGuard Category Based Filter*.
3. Select the category and then select *Allow*, *Monitor*, or *Redirect to Block Portal* for that category.
4. In the *Options* section, select a setting for *Redirect Portal IP*. Select either *Use FortiGuard Default* (208.91.112.55) or click *Specify* and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS response packet.

New DNS Filter Profile

☒ FortiGuard Category Based Filter

☒ Allow
 ☐ Monitor
 ☐ Redirect to Block Portal

Name	Action
General Organizations	Allow

Options

Redirect Portal IP: Use FortiGuard Default | Specify

208.91.112.55

Allow DNS requests when a rating error occurs ☐
 Log all DNS queries and responses ☐

OK Cancel

5. Click **OK**.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```

config dnsfilter profile
  edit "demo"
    set comment ''
    config domain-filter
      unset domain-filter-table
    end
    config ftgd-dns
      set options error-allow
      config filters
        edit 2
          set category 2
          set action monitor
        next
        edit 7
          set category 7
          set action monitor
        next
        ...
        edit 22
          set category 0
          set action monitor
        next
      end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action {redirect | block}
    set block-botnet enable
    set safe-search enable
    set redirect-portal 93.184.216.34
    set youtube-restrict strict
  next
end

```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, to do a DNS query for some domains. For example:

```

#dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.      17164   IN      A      93.184.216.34

;; AUTHORITY SECTION:
com.                  20027   IN      NS      h.gtld-servers.net.
com.                  20027   IN      NS      i.gtld-servers.net.
com.                  20027   IN      NS      f.gtld-servers.net.

```

```

;; From 172.16.95.16@53 (UDP) in 3.8 ms

```

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.

Add Filter										Details
Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index #
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		52	Information Technology	1
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1					2

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
```

```

# execute log display
2 logs found.
2 logs returned.

```

```

qname="www.example.com" qtype="A" qtypeval=1 qclass="IN"
```

Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1531](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1551](#)).

To configure botnet C&C domain blocking in the GUI:

1. Go to **Security Profiles > DNS Filter** and click **Create New**, or edit an existing profile.
2. Enable **Redirect botnet C&C requests to Block Portal**.
3. Optionally, click the **botnet package** link. The **Botnet C&C Domain Definitions** pane opens, which displays the latest list.

The screenshot shows the 'Edit DNS Filter Profile' window on the left and the 'Botnet C&C Domain Definitions' pane on the right.

Edit DNS Filter Profile:

- Name: demo
- Comments: Co
- Redirect botnet C&C requests to Block Portal: ☒
- Enforce 'Safe Search' on Google, Bing, YouTube: ☒
- Restrict YouTube Access: ☒
- FortiGuard Category Based Filter: ☒
- Buttons: Allow, Monitor, Block
- Categories and Actions:
 - Adult/Mature Content: 15
 - Bandwidth Consuming: 4
 - General Interest - Business: 15
 - Finance and Banking: Allow
 - Search Engines and Portals: Allow
 - General Organizations: Allow
 - Business: Allow
 - Information and Computer Security: Allow
 - Government and Legal Organizations: Allow

Botnet C&C Domain Definitions:

Search	FQDN	Action
	oakbarrels-shop.co.uk	Other
	vpygumqwcz.ws	Other
	fceueqmmfftetl.co.uk	Other
	shadyacresminis.bravepages.com	Other
	canind.co	Other
	safety.microsoft.com.cnknk.klf3htd7zgbdzbsln6qgm2vs.review	Other
	ouzgspmhcz.ws	Other
	kiggmy.cn	Other
	trastres.com	Other
	olyjune.com	Other
	service-limited-account.net	Other
	biostevia.co	Other
	vwxzgehdldl.cn	Other
	lgoibyslivy.co.uk	Other
	52uo5k3t73ypjje.91006j.bid	Other

	ufxifajbqssgc.co.uk	Other
	homeworksite.tk	Other
	bvxszehcfetwddk.org	Other

4. Configure the other settings as needed.
5. Click **OK**.

To configure botnet C&C domain blocking in the CLI:

```
config dnsfilter profile
edit "demo"
set comment ''
config domain-filter
unset domain-filter-table
end
config ftgd-dns
```

```

        set options error-allow
        config filters
            ...
        end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action block
    set block-botnet enable
    set safe-search enable
    set redirect-portal 208.91.112.55
    set youtube-restrict strict
next
end

```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as dig or nslookup, to send a DNS query to traverse the FortiGate. For example:

```

#dig canind.co
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 997
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; canind.co.                IN      A

;; ANSWER SECTION:
canind.co.                60      IN      A      208.91.112.55

;; Received 43 B
;; Time 2019-04-05 09:55:21 PDT
;; From 172.16.95.16@53(UDP) in 0.3 ms

```

The botnet domain query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name to view the DNS query blocked as a botnet domain.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1	Domain was blocked by dns botnet C&C			
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1				

To check the DNS filter log in the CLI:

```
(vdom1) # execute log filter category utm-dns
```

```

(vdom1) # execute log display
2 logs found.
2 logs returned.

```

```

1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135

```

```
srcip=10.1.100.18 srcport=57447 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16

dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=24339
qname="canind.co" qtype="A" qtypeval=1 qclass="IN"
```

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

```
(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0
```

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as dig or nslookup, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```
# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com.          IN      A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60      IN      A      208.91.112.55

;; Received 64 B
;; Time 2019-04-05 11:06:47 PDT
;; From 172.16.95.16@53(UDP) in 0.6 ms
```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55).

To check the DNS filter log in the GUI:

1. Go to *Log & Report > DNS Query* to view the DNS query blocked by botnet C&C IPDB.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1	Domain was blocked by dns botnet C&C			
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1				

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns
```

```
(global) # execute log display
```

```
2 logs found.
```

```
2 logs returned.
```

```
1: date=2019-04-05 time=11:06:48 logid="1501054600" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232

dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=16265
qname="cpe-98-25-53-166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN"
```

To check botnet activity:

1. Go to *Dashboard > Status* and locate the *Botnet Activity* widget.

Botnet Activity		≡
Known IPs	2,805	
Known Domains	80,000	
Activity Since	2023/05/10 11:14:07	
Blocked IPs	1	
Blocked Domains	1	
Blocked Connections	46	

2. If you do not see the widget, click *Add Widget*, and add the *Botnet Activity* widget.

DNS safe search

The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, DuckDuckGo, Qwant, and YouTube search engines. The FortiGate responds with content filtered by the search engine.

For individual search engine safe search specifications, refer to the documentation for [Google](#), [Bing](#), [DuckDuckGo](#), [Qwant](#), and [YouTube](#).

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1531](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1551](#)).

To configure safe search in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Enforce 'Safe search' on Google, Bing, YouTube* (this setting also applies safe search on DuckDuckGo and Qwant).
3. For *Restrict YouTube Access*, click *Strict* or *Moderate*.

4. Configure the other settings as needed.
5. Click *OK*.

To configure safe search in the CLI:

```
config dnsfilter profile
  edit "demo"
    config ftgd-dns
      set options error-allow
    config filters
      edit 2
        set category 2
      next
    ...
  end
end
set log-all-domain enable
set block-botnet enable
set safe-search enable
set youtube-restrict strict
next
end
```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```
# dig www.bing.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.bing.com.                IN      A

;; ANSWER SECTION:
www.bing.com.                103     IN      CNAME    strict.bing.com
```

```
strict.bing.com.      103      IN      A      204.79.197.220
```

```
;; Received 67 B
;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53 (UDP) in 196.0 ms
```

The DNS query for `www.bing.com` returns with a CNAME `strict.bing.com`, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1	DNS Safe Search enforced		41	Search Engines and Portals
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1				

The DNS filter log in FortiOS shows a message of *DNS Safe Search enforced*.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.
```

```
1: date=2019-04-05 time=14:34:53 logid="1501054804" type="utm" subtype="dns" eventtype="dns-
response" level="notice" vd="vdom1" eventtime=1554500093 policyid=1 sessionid=65955

qname="www.bing.com" qtype="A" qtypeval=1 qclass="IN"
```

Local domain filter

In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter.

- If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.
- If the local domain filter action is set to block and an entry matches, then that DNS query is blocked and redirected.
- If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver.

- If the local domain filter action is set to monitor and an entry matches, it will skip the FortiGuard category-based domain filter, directly return to the client DNS resolver, and log the resolution.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1531](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1551](#)).

In this example, a DNS filter profile is configured and applied to a firewall policy running proxy-based inspection mode.

To configure the local domain filter in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Set *Name* to *demo*.
3. In the *Static Domain Filter* section, enable *Domain Filter*.
4. Click *Create New*. The *Create Domain Filter* pane opens.
5. Enter a domain, and select a *Type* and *Action*. This example has three filters:

Domain	Type	Action
www.fortinet.com	Simple	Allow
*.example.com	Wildcard	Redirect to Block Portal
google	Reg. Expression	Monitor

6. Click *OK*. The entry appears in the table.

Edit DNS Filter Profile

Static Domain Filter

Domain Filter ☒

[+ Create New](#) [Edit](#) [Delete](#)

Domain	Type	Action	Status
www.fortinet.com	simple	<input checked="" type="checkbox"/> Allow	<input checked="" type="checkbox"/> Enable
*.example.com	wildcard	<input checked="" type="checkbox"/> Redirect to Block Portal	<input checked="" type="checkbox"/> Enable
google	regex	<input checked="" type="checkbox"/> Monitor	<input checked="" type="checkbox"/> Enable

7. In the *FortiGuard Category Based Filter* table, set *General Interest - Business > Search Engines and Portals* to *Redirect to Block Portal*.
8. Configure the remaining settings as required.
9. Click *OK*.

To apply the DNS filter to a policy-mode policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
2. Configure the *Incoming Interface*, *Outgoing Interface*, *Source*, *Destination*, and *Service* as required.
3. Set *Inspection Mode* to *Proxy-based*.
4. Enable *DNS Filter* and select the *demo* filter.
5. Set *SSL Inspection* to *certificate-inspection*.
6. Configure the remaining settings as required.
7. Click *OK*.

To configure the local domain filter in the CLI:

```
config dnsfilter domain-filter
  edit 1
    set name "demo"
    set comment ''
    config entries
      edit 1
        set domain "www.fortinet.com"
        set type simple
        set action allow
        set status enable
      next
      edit 2
        set domain "*.example.com"
        set type wildcard
        set action block
        set status enable
      next
      edit 3
        set domain "google"
        set type regex
        set action monitor
        set status enable
      next
    end
  config domain-filter
    set domain-filter-table 1
  end
  config ftgd-dns
    config filters
      edit 23
        set category 41
        set action block
      next
    end
  end
next
end
```

Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```
config entries
  edit 1
    set domain "*.host"
    set type wildcard
  next
end
```

will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdns.com`.

To avoid this, use an explicit regular expression search string:

```
config entries
  edit 1
    set domain "^.*\\.host$"
    set type regexp
  next
end
```

To apply the DNS filter to a proxy-mode policy in the CLI:

```
config firewall policy
  edit 1
    set name "port3-port1"
    set srcintf "port3"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "certificate-inspection"
    set dnsfilter-profile "demo"
    set logtraffic all
    set nat enable
  next
end
```

Testing and Verification

On a client computer, perform DNS lookup on the three domains:

Domain	DNS query result	Log
www.fortinet.com	Allowed. Resolved to correct IP.	None

Domain	DNS query result	Log
www.example.com	Blocked. Redirected to IP of block page.	Deny log
www.google.com	Allowed. Resolved to correct IP.	Allow log

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name to show the logs.

To check the DNS filter log in the CLI:

```
# execute log display
71 logs found.
10 logs returned.
```

```
1: date=2022-08-17 time=18:16:50 eventtime=1660785410733825945 tz="-0700" logid="1501054401"

DNS translation

This setting allows you to translate a DNS resolved IP address to another IP address you specify on a per-policy basis.

For example, website A has a public address of 1.2.3.4. However, when your internal network users visit this website, you want them to connect to the internal host 192.168.3.4. You can use DNS translation to translate the DNS resolved address 1.2.3.4 to 192.168.3.4. Reverse use of DNS translation is also applicable. For example, if you want a public DNS query of your internal server to get a public IP address, then you can translate a DNS resolved private IP to a public IP address.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1531](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1551](#)).

Sample configuration

This configuration forces the DNS filter profile to translate 93.184.216.34 (www.example.com) to 192.168.3.4. When internal network users perform a DNS query for www.example.com, they do not get the original www.example.com IP address of 93.184.216.34. Instead, it is replaced with 192.168.3.4.

To configure DNS translation in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. In the *Static Domain Filter* section, enable *DNS Translation*.
3. Click *Create New*. The *New DNS Translation* pane opens.
4. Enter the *Original Destination* (the domain's original IP address), the *Translated Destination* IP address, and the *Network Mask*.

5. Click *OK*. The entry appears in the table.

6. Configure the other settings as needed.
7. Click OK.

To configure DNS translation in the CLI:

```
config dnsfilter profile
  edit "demo"
    set comment ''
    ...
    config dns-translation
      edit 1
        set src 93.184.216.34
        set dst 192.168.3.4
        set netmask 255.255.255.255
      next
    end
    set redirect-portal 0.0.0.0
    set redirect-portal6 ::
    set youtube-restrict strict
  next
end
```

To check DNS translation using a command line tool before DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 27030
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.      33946   IN      A      93.184.216.34

;; AUTHORITY SECTION:
example.com.          18578   IN      NS      b.iana-servers.net.
example.com.          18578   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 10:47:26 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 62060
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:

;; AUTHORITY SECTION:
```

```
example.com.          17123   IN      NS      b.iana-servers.net.
example.com.          17123   IN      NS      a.iana-servers.net.
```

```
;; Received 97 B
;; Time 2019-04-08 11:11:41 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

DNS translation network mask

The following is an example of DNS translation that uses a network mask:

To configure DNS translation in the CLI:

```
config dns-translation
    edit 1
        set src 93.184.216.34
        set dst 1.2.3.4
        set netmask 255.255.224.0
    next
end
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.          29322   IN      A      1.2.24.34

;; AUTHORITY SECTION:
example.com.              13954   IN      NS      a.iana-servers.net.
example.com.              13954   IN      NS      b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms
```

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

```
01011101.10111000.11011000.00100010 93.184.216.34
00000000.00000000.00011111.11111111 ~255.255.224.0
----- &
00000000.00000000.00011000.00100010 0.0.24.34
```

2. AND dst(Translated IP) with netmask:

```
00000001.00000010.00000011.00000100 1.2.3.4
11111111.11111111.11100000.00000000 255.255.224.0
----- &
00000001.00000010.00000000.00000000 1.2.0.0
```

3. Final step 2 bitwise-OR 3:

```

00000000.00000000.00011000.00100010 0.0.24.34
00000001.00000010.00000000.00000000 1.2.0.0
-----
00000001.00000010.00011000.00100010 1.2.24.34

```

Applying DNS filter to FortiGate DNS server

You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

Depending on the configuration, DNS service works in three modes: *Recursive*, *Non-Recursive*, or *Forward to System DNS* (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see [FortiGate DNS server on page 274](#).

You can apply a DNS filter profile to *Recursive* and *Forward to System DNS* mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.

To configure DNS service in the GUI:

1. Go to *Network > DNS Servers* (if this option is not available, go to *System > Feature Visibility* and enable *DNS Database*).
2. In the *DNS Service on Interface* section, click *Create New* and select an *Interface* from the dropdown.
3. For *Mode*, select *Forward to System DNS*.
4. Enable *DNS Filter* and select a profile from the dropdown.

5. Click **OK**.

To configure DNS service in the CLI:

```

config system dns-server
    edit "port10"
        set mode forward-only
        set dnsfilter-profile "demo"
    next
end

```

To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5, and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```

# dig @10.1.100.5 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

```

```
;; QUESTION SECTION:
;; www.fortinet.com.          IN      A

;; ANSWER SECTION:
www.fortinet.com.        60      IN      A      208.91.112.55

;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms
```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.0, DoT and DoH traffic silently passes through the DNS proxy. In 7.0, the WAD is able to handle DoT and DoH, and redirect DNS queries to the DNS proxy for further inspection.

In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.

To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
 - a. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*.
 - b. Set *Inspection method* to *Full SSL Inspection*. DoT and DoH can only be inspected using doing deep inspection.

- c. In the *Protocol Port Mapping* section, enable *DNS over TLS*.

- d. Configure the other settings as needed.

- e. Click **OK**.

2. Configure the DNS filter profile:

- a. Go to *Security Profiles > DNS Filter* and click *Create New*.

- b. Enable *Redirect botnet C&C requests to Block Portal*.

- c. Enable *FortiGuard Category Based Filter* and set the *Action* for the *Education* category to *Redirect to Block Portal*.

- d. Configure the other settings as needed.

- e. Click **OK**.

3. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.

- b. Enable *DNS Filter* and select the profile you created.

- c. For *SSL Inspection*, select the profile you created.

- d. Configure the other settings as needed.

- e. Click **OK**.

To configure DNS inspection of DoT and DoH queries in the CLI:

1. Configure the SSL-SSH profile:

```
config firewall ssl-ssh-profile
  edit "ssl"
    config dot
      set status deep-inspection
      set client-certificate bypass
      set unsupported-ssl-cipher allow
      set unsupported-ssl-negotiation allow
```

```
        set expired-server-cert block
        set revoked-server-cert block
        set untrusted-server-cert allow
        set cert-validation-timeout allow
        set cert-validation-failure block
    end
next
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
        set block-botnet enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set webfilter-profile "webfilter"
        set dnsfilter-profile "dnsfilter"
        set nat enable
    next
end
```

Testing the connection

To query DNS over TLS:

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses `kdig` on an Ubuntu client). The `www.ubc.ca` domain belongs to the education category:

```
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port
(853), protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
```

```
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG: #1, C=US, ST=California, L=San Francisco, O=Cloudflare\, Inc., CN=cloudflare-
dns.com
;; DEBUG: SHA-256 PIN: elpYCnCs9ZtkQBI4+cb2QtZcyO15UI9jMkSvbTsTad0=
;; DEBUG: #2, C=US, ST=California, L=Sunnyvale, O=Fortinet, OU=Certificate
Authority, CN=FG3H1E5818903681, EMAIL=support@fortinet.com
;; DEBUG: SHA-256 PIN: s48VtdOD1NZfAG2g/92hMLhitU51qsP9pkHAUtTJ+f4=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, The certificate is trusted.
;; TLS session (TLS1.3)-(ECDHE-SECP256R1)-(ECDSA-SECP256R1-SHA256)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca. IN A

;; ANSWER SECTION:
www.ubc.ca. 60 IN A 208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.1@853(TCP) in 6.0 ms
```

In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

1. In your browser, enable DNS over HTTPS.
2. Go to www.ubc.ca. The website is redirected to the block page.

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses DNS over TLS (DoT, TCP port 853) to connect to the SDNS server. See [DNS over TLS and HTTPS on page 282](#) for more information.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

```
# diagnose test application dnsproxy 3
...
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0
probe=0 failure=0 last_failed=0
```

The SDNS server IP address might be different depending on location (in this example, it is 173.243.140.53:853).

2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

```
# execute ping 173.243.140.53
```

3. If FortiGuard is not reachable using anycast, configure the default FortiGuard SDNS (unicast) server (208.91.112.220):

```
config system fortiguard
    set fortiguard-anycast disable
    set sdns-server-ip "208.91.112.220"
end
```

4. Verify the list of SDNS servers again:

```
# diagnose test application dnsproxy 3
FGD_DNS_SERVICE_LICENSE:
server=208.91.112.220:53, expiry=2023-10-28, expired=0, type=2
server=83.231.212.53:53, expiry=2023-10-28, expired=0, type=2
```

The default FortiGuard SDNS server should work in most cases; however, you can switch to another server to see if it improves latency.

By default, DNS filtering connects to the FortiGuard secure DNS server over anycast and uses DoT (TCP port 853) when the default settings of `fortiguard-anycast enable` and `fortiguard-anycast-source fortinet` are configured. Disabling `fortiguard-anycast` will force the FortiGate to use cleartext (UDP port 53) instead of DoT (TCP port 853) in addition to disabling FortiGuard secure DNS over anycast.

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

```
# diagnose test application dnsproxy 3
```

2. Find the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

```
FGD_DNS_SERVICE_LICENSE:
server=173.243.140.53:853, expiry=2023-10-28, expired=0, type=2
```

3. Find the `SDNS servers` line to view the functioning servers:

```
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0
probe=0 failure=0 last_failed=0
```

Checking the FortiGate DNS filter profile configuration

To check the DNS filter profile configuration:

1. In FortiOS, create a local domain filter and set the *Action* to *Redirect to Block Portal* (see [Local domain filter on page 1543](#)).
2. Apply this DNS filter profile to the policy.
3. From the client PC, perform a DNS query on this domain. If you get the profile's redirected portal address, this means that the DNS filter profile works as expected.

Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:

Test level	Action
1	Clear DNS cache
2	Show statistics
3	Dump DNS setting
4	Reload FQDN
5	Requery FQDN
6	Dump FQDN
7	Dump DNS cache
8	Dump DNS database
9	Reload DNS database
10	Dump secure DNS policy/profile
11	Dump botnet domain
12	Reload secure DNS setting
13	Show hostname cache
14	Clear hostname cache
15	Show SDNS rating cache
16	Clear SDNS rating cache
17	Show DNS debug bit mask

Test level	Action
18	Show DNS debug object members
99	Restart the dnsproxy worker

To debug DNS proxy details:

```
# diagnose debug application dnsproxy -1
# diagnose debug {enable | disable}
```

Application control

FortiGate can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).

FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

This functionality requires a subscription to FortiGuard Application Control.

The following topics provide information about application control:

- [Configuring an application sensor on page 1559](#)
- [Basic category filters and overrides on page 1560](#)
- [Excluding signatures in application control profiles on page 1563](#)
- [Port enforcement check on page 1565](#)
- [Protocol enforcement on page 1565](#)
- [SSL-based application detection over decrypted traffic in a sandwich topology on page 1567](#)
- [Matching multiple parameters on application control signatures on page 1568](#)

- [Application signature dissector for DNP3 on page 1571](#)
- [Blocking QUIC manually on page 1571](#)

Configuring an application sensor

FortiGate can recognize network traffic generated by a large number of applications using application control, which relies on IPS protocol decoders. Application sensors control what action is taken with application traffic.

To configure an application sensor:

1. Go to *Security Profiles > Application Control* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the sensor.
<i>Comments</i>	Enter a comment (optional).
<i>Categories</i>	Configure the action to take on groups of signatures based on their category type. Applications belonging to the category trigger the configured action: monitor, allow, block, or quarantine. See Basic category filters and overrides on page 1560 for more information.
<i>Network Protocol Enforcement</i>	Enable/disable the enforcement of protocols over selected ports. See Protocol enforcement on page 1565 for more information.
<i>Application and Filter Overrides</i>	Configure multiple applications signatures with a dedicated action for a single sensor. Filters can be added based on the application category, behavior, popularity, protocol, risk, technology, or vendor subtype. For more information, see <ul style="list-style-type: none"> • Configuring application and filter overrides on page 1561 • Matching multiple parameters on application control signatures on page 1568 • Blocking applications with custom signatures on page 1739
<i>Block applications detected on non-default ports</i>	When enabled: <ul style="list-style-type: none"> • For monitor and allow actions, applications will be blocked if detected on non-default ports (as defined in FortiGuard application signatures). • Block actions still block traffic for the application regardless of the port. See Port enforcement check on page 1565 for more information.
<i>Allow and Log DNS Traffic</i>	Allow and log DNS application protocol signatures.
<i>Replacement Messages for HTTP-based Applications</i>	Enable/disable replacement messages for blocked applications. See Replacement messages on page 2671 for information about replacement messages.

3. Click *OK*.

Basic category filters and overrides

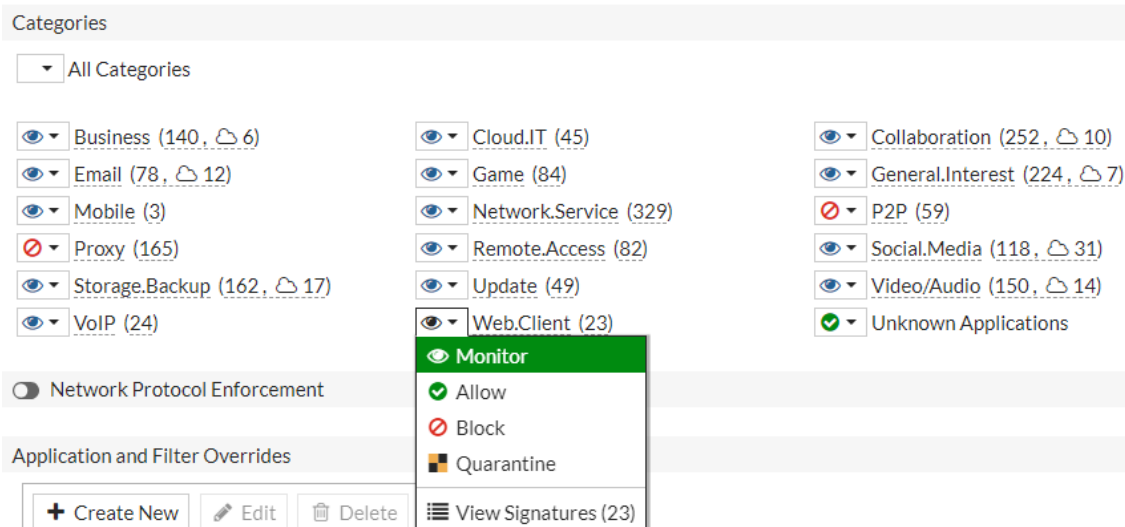

When creating an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).

Action	Description
Monitor	Passes the traffic and generates a log message.
Allow	Passes the traffic but does not generate a log message.
Block	Drops the detected traffic and generates a log message.
Quarantine	Blocks the traffic from an attacker IP address until the expiration time is reached and generates a log message.

For more information about application control logs, see [Security Events log page on page 3157](#).

To configure category filters in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*, or edit an existing sensor.
2. Under *Categories*, click the icon next to the category name to set the action or view the application signatures.

3. If you select the *Quarantine* action, the *Quarantine Duration* pane will open. Enter the duration values and click *OK*.

Quarantine Duration

Days	<input type="text" value="0"/>
Hours	<input type="text" value="0"/>
Minutes	<input type="text" value="5"/>

4. Click *OK*.

To configure category filters in the CLI:

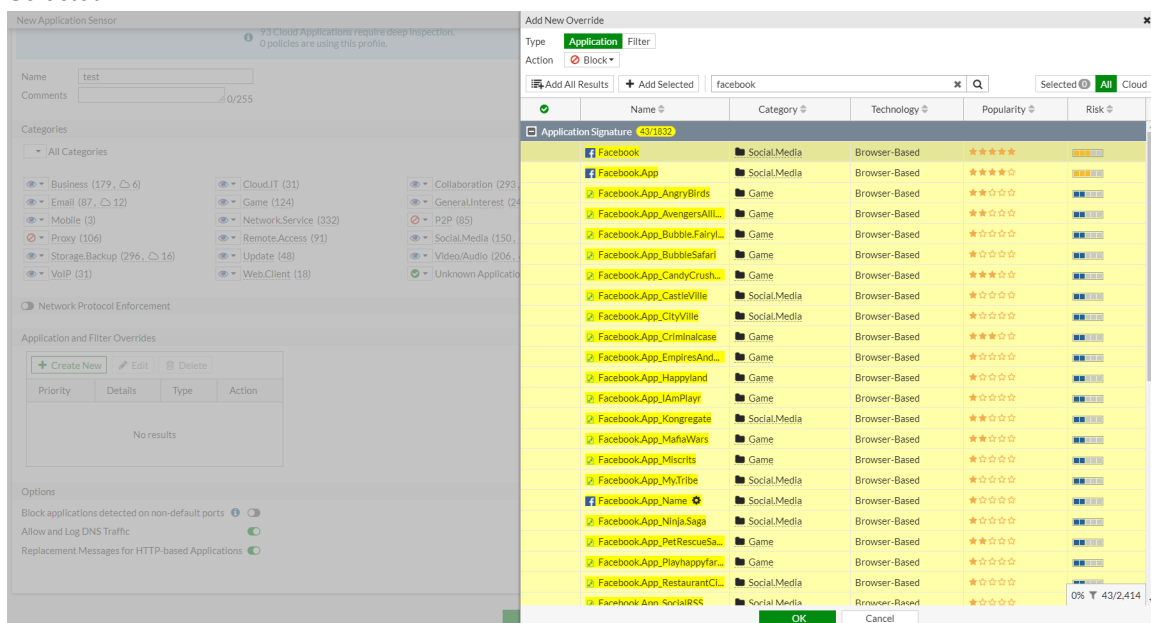

```
config application list
  edit <name>
    config entries
      edit <id>
        set category <id>
        set action {pass | block | reset}
        set quarantine {none | attacker}
        set quarantine-expiry <###d##h##m>
        set log {enable | disable}
      next
    end
  next
end
```

Configuring application and filter overrides

Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

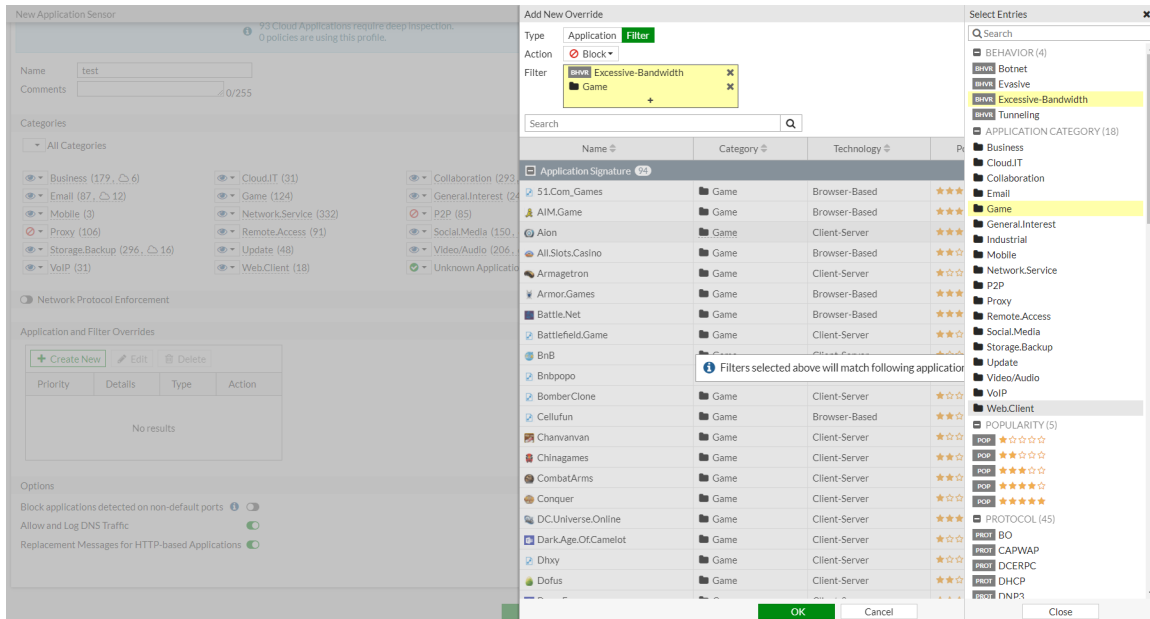

To configure overrides in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Add an application:
 - a. For *Type*, select *Application*.
 - b. Select an *Action* from the dropdown.
 - c. In the *Search* box, enter an application name and press *Enter*.
 - d. In the search results, select desired the applications (you can select multiple applications) and click *Add Selected*.

- e. Click *OK*.

4. Add a filter:
 - a. In the *Application and Filter Overrides* table, click *Create New*.
 - b. For *Type*, select *Filter*.
 - c. Select an *Action* from the dropdown.
 - d. In the *Filter* field, click the +. The *Select Entries* pane opens, and you can search based on filter subtypes. This example has excessive bandwidth (under behavior) and game (under application category).

- e. Click OK.

5. Click OK.

To configure overrides in the CLI:

```
config application list
  edit <name>
    config entries
      edit <id>
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set action {pass | block | reset}
        set log {enable | disable}
      next
    end
  next
end
```

protocols <integer> Application protocol filter (0 - 47, or all).

risk <integer> Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).

vendor <id>	Application vendor filter (0 - 25, or all).
technology <id>	Application technology filter: <ul style="list-style-type: none"> • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
behavior <id>	Application behavior filter: <ul style="list-style-type: none"> • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
popularity <integer>	Application popularity filter (1 - 5, from least to most popular).
action {pass block reset}	Pass/block traffic or reset the connection for traffic from this application (default = block).
log {enable disable}	Enable/disable logging for this application list (default = enable).

Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on the entry in which it is excluded, but may match subsequent entries that exist.

To configure signature exclusion:

```
config application list
  edit <name>
    config entries
      edit <id>
        set category <id>
        set exclusion <application id>
        set action {pass | block | reset}
      next
    end
  next
end
```

Sample configurations

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of other-application-action is set to pass.

To configure signature exclusion:

```
config application list
  edit "test"
    set other-application-action pass
    set unknown-application-action pass
    set other-application-log enable
    set unknown-application-log enable
    config entries
      edit 1
        set category 23
        set exclusion 34527
        set action block
      next
    end
  next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

To configure signature exclusion:

```
config application list
  edit "test"
    set other-application-action pass
    set unknown-application-action pass
    set other-application-log enable
    set unknown-application-log enable
    config entries
      edit 1
        set category 23
        set exclusion 34527
        set action pass
      next
      edit 2
        set application 34527
        set action block
      next
    end
  next
end
```

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

```
config application list
  edit "test"
    set other-application-action pass
    set unknown-application-action pass
    set other-application-log enable
    set unknown-application-log enable
```

```
        config entries
            edit 1
                set category 6
                set exclusion 107347980
                set action block
            next
        end
    next
end
```

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

If the default network service is enabled in the application control profile, a port enforcement check is done at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

To configure port enforcement check:

```
config application list
    edit <name>
        set enforce-default-app-port enable
        config entries
            edit 1
                set application 15896
                set action pass
            next
        end
    next
end
```

For example, when applying this application control sensor, FTP traffic (application 15896) with the standard port (port 21) is allowed, while the non-standard port (port 2121) is blocked.

Protocol enforcement

Protocol enforcement allows you to configure networking services (e.g. FTP, HTTP, HTTPS) on known ports (e.g. 21, 80, 443). For protocols that are not allowlisted under select ports, the IPS engine performs the violation action to block, allow, or monitor that traffic.

This feature can be used in the following scenarios:

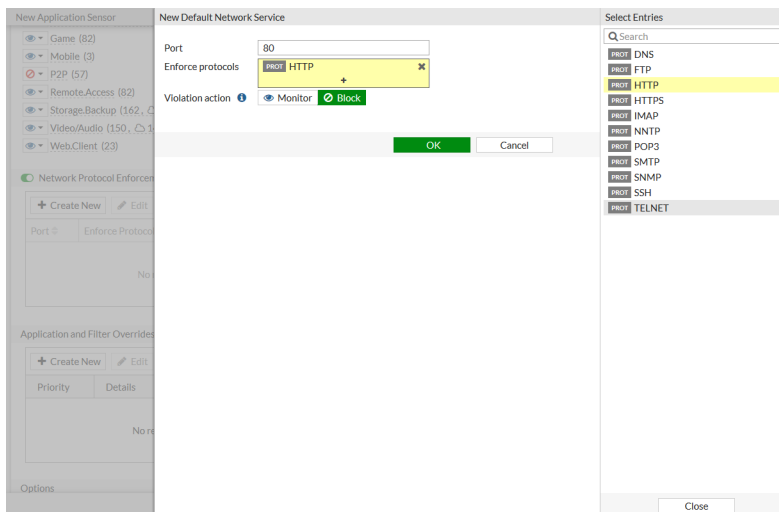

- When one protocol dissector confirms the service of network traffic, protocol enforcement can check whether the confirmed service is allowlisted under the server port. If it is not allowlisted, the traffic is considered a violation and IPS can take the action specified in the configuration (block or monitor it).
- When there is no confirmed service for the network traffic, the traffic is considered a service violation if IPS dissectors rule out all of the services enforced under its server port.

In an applicable profile, a default network service list can be created to associate well known ports with accepted services.

In the following example, an application sensor is configured to enforce HTTP on port 80 (block), and DNS on port 53 (monitor).

To configure protocol enforcement in the GUI:

1. Go to *Security Profiles > Application Control*.
2. Create a new application sensor or edit an existing one.
3. Enable *Network Protocol Enforcement*.
Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.
4. In the *Network Protocol Enforcement* table, click *Create New*.
5. Configure the entry for HTTP:
 - a. For *Port*, enter 80.
 - b. For *Enforced protocols*, select *HTTP*.
 - c. For *Violation action*, select *Block*.
 - d. Click *OK*.

6. Configure the entry for DNS:
 - a. Click *Create New*, then for *Port*, enter 53.
 - b. For *Enforced protocols*, select *DNS*.
 - c. For *Violation action*, select *Monitor*.
 - d. Click *OK*.

The entries are displayed in the table.

7. Click OK.

To configure protocol enforcement in the CLI:

```
config application list
  edit "protocol-GUI"
    set other-application-log enable
    set control-default-network-services enable
    config default-network-services
      edit 1
        set port 80
        set services http
        set violation-action block
      next
      edit 2
        set port 53
        set services dns
        set violation-action monitor
      next
    end
  next
end
```

SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application control. In some pre-defined signatures, the signature is pre-marked with the *require_ssl_di* tag. The *force-inclusion-ssl-di-sigs* option under *application list* allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.

To configure SSL-based application detection over decrypted traffic:

```

config application list
  edit "test"
    set force-inclusion-ssl-di-sigs {enable | disable}
  next
end

```

Example pre-marked SSL-based signature:

```

F-SBID( --vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; -
-revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20;
--depend-on 15832; --depend-on 38468; --require_ssl_di "Yes"; --casi 1; --casi 8; --parent 15832; --app_port
"TCP/443"; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --
pattern ".facebook.com"; --context host; --no_case; --tag set, Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date
20190301;)

```

All signatures that include the *require_ssl_di* tag are pre-defined and cannot be customized.

Matching multiple parameters on application control signatures

Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.

This example uses the *Modbus_Func05.Write.Single.Coil.Validation* signature. This is an OT signature, so ensure that no signatures are excluded:

```

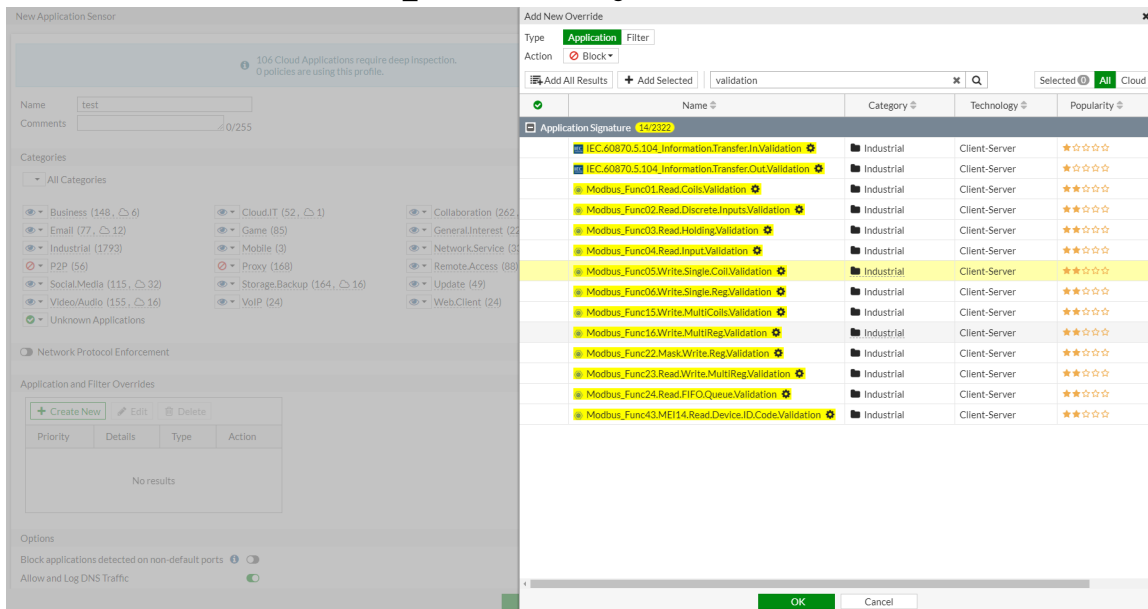

config ips global
  set exclude-signatures none
end

```

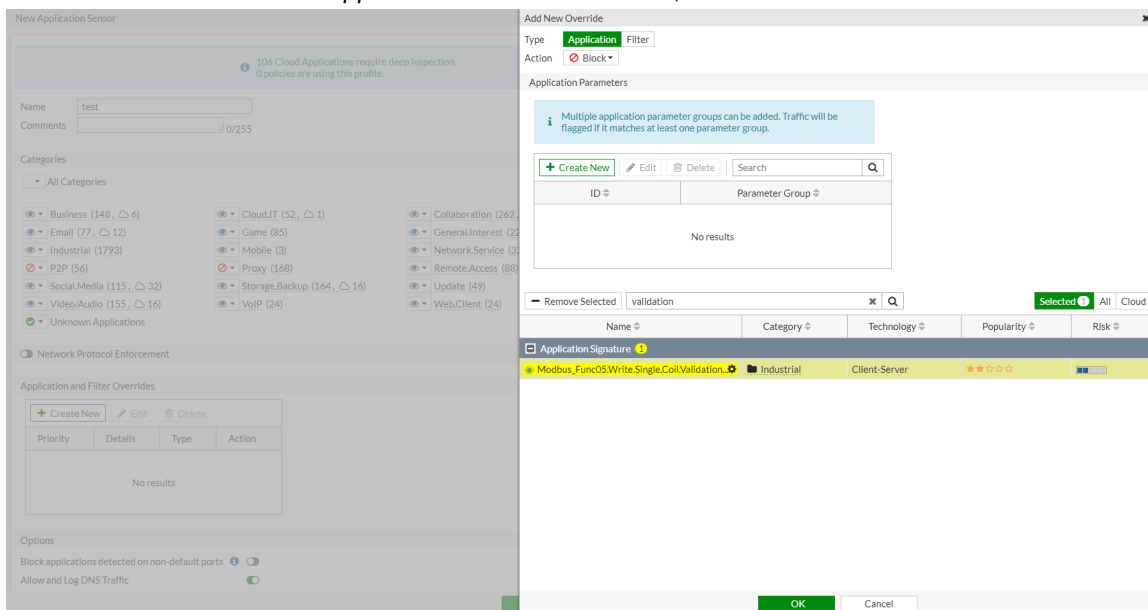

To configure an application sensor with multiple parameters in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Search for *Modbus_Func05.Write.Single.Coil.Validation* and press **Enter**. A gear icon beside the signature name indicates it has configurable application parameters.

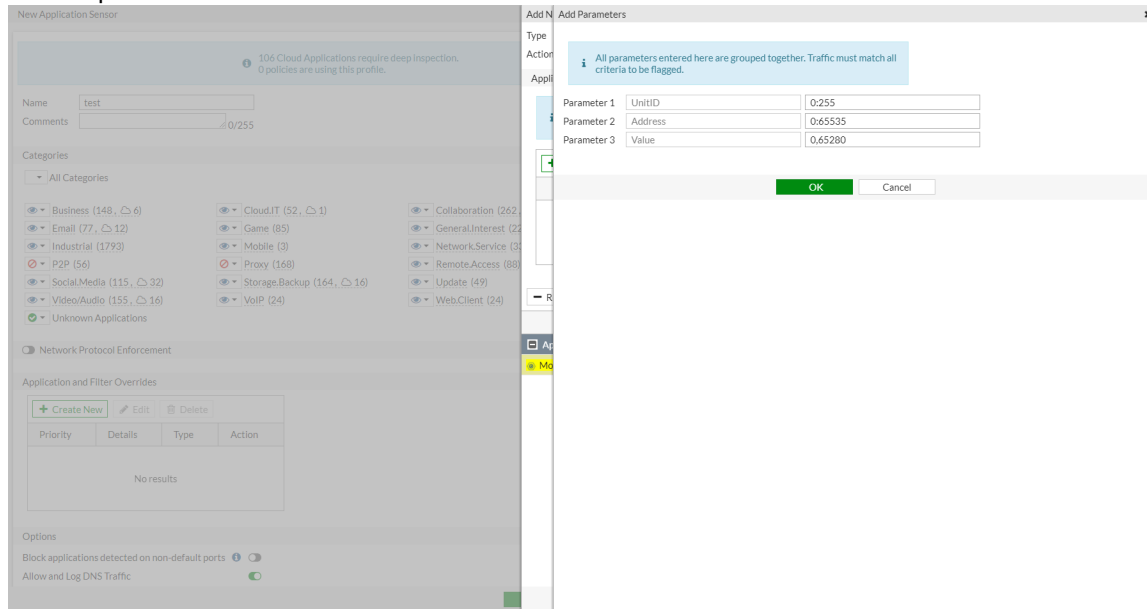

4. In the search results, select *Modbus_Func05.Write.Single.Coil.Validation* and click *Add Selected*.

5. Click the *Selected* tab. In the *Application Parameters* section, click *Create New*.

6. Edit the parameter values as needed.

7. Click OK.

8. Add more signatures if needed.

9. Click OK.

To configure an application sensor with multiple parameters in the CLI:

```
config application list
  edit "test"
    set other-application-log enable
    config entries
      edit 1
        set application 48885
        config parameters
          edit 1
            config members
              edit 1
                set name "UnitID"
                set value "0:255"
              next
              edit 2
                set name "Address"
                set value "0:65535"
              next
              edit 3
                set name "Value"
                set value "0,65280"
              next
            end
          next
        end
      next
    end
  next
edit 2
  set category 2 6
```

```
        next
    end
next
end
```

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate OT signatures must be enabled to use RealPort.DNP3 signatures:

```
config ips global
    set exclude-signatures none
end
```

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

Sample logs

```

Blocking QUIC manually

Blocking QUIC by default in the application control profile is no longer necessary since HTTP3 over QUIC is fully supported by FortiOS. Users can still select the QUIC application signature (40169) to manually block or monitor QUIC.

To block the QUIC application signature in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*.
2. Enter a name (*test*).
3. Add a filter override for the QUIC application signature:
 - a. In the *Application and Filter Overrides* section, click *Create New*. The *Add New Override* pane appears.
 - b. In the search box, enter *QUIC* and press *Enter*.
 - c. Select the *QUIC* entry and click *Add Selected*.

d. Click OK.

4. Configure the other sensor settings as needed.

5. Click OK.

To block the QUIC application signature in the CLI:

```
config application list
edit "test"
set other-application-log enable
```

```

config entries
edit 1
    set application 40169
    set action block
    set log enable
next
end
next
end

```

Sample traffic log

Inline CASB - NEW

The inline CASB security profile enables the FortiGate to perform granular control over SaaS applications directly on firewall policies. The supported controls include:

Control	Description
Privilege control	Specify the action to apply to user activities per application such as upload, download, share, delete, log in, and so on.
Safe search	On SaaS applications that support searching, enable and select the level of safe search.
Tenant control	Allow only users belonging to specific domains to access the SaaS application.
UTM bypass	For each user activity, bypass further UTM scanning any of the following security profiles: <ul style="list-style-type: none"> Antivirus DLP File filter Video filter Web filter

Administrators can customize their own SaaS applications, matching conditions, and custom controls and actions.

A firewall policy must use proxy-based inspection with a deep inspection SSL profile to apply the inline CASB profile and scan the traffic payload.

Inline CASB can be applied to a firewall policy or a proxy policy. However, applying it to a ZTNA type firewall policy or proxy policy will not take effect.

The Inline-CASB Application Definitions entitlement is licensed under the basic firmware and updates contract. To view the entitlement information, go to *System > FortiGuard* and expand the *Firmware & General Updates* section.

To enable inline CASB security profiles in the GUI:

1. Go to *System > Feature Visibility*.
2. Enable *Inline-CASB* in the *Security Features* section.
3. Click *Apply*.

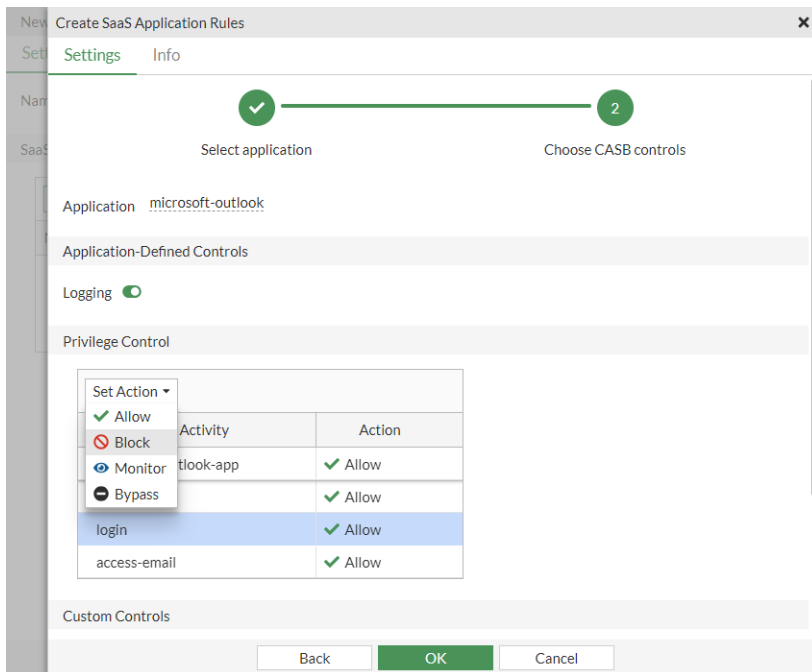

Example 1: privilege control

In this example, logging in to Microsoft Outlook is blocked by the privilege control settings in the inline CASB profile.

To configure an inline CASB profile with privilege control in the GUI:

1. Configure the inline CASB profile:
 - a. Go to *Security Profiles > Inline-CASB* and click *Create new*.
 - b. Enter a *Name*, such as *outlook_test*.
 - c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
 - d. Set the *Application* to *microsoft-outlook*, then click *Next*.

- e. Enable *Logging*.
- f. In the *Privilege Control* table, select *login* and from the *Set Action* dropdown, select *Block*.

g. Click OK.

2. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy*. Edit an existing policy, or create a new one.
- b. Set the *Inspection Mode* to *Proxy-based*.
- c. In the *Security Profiles* section, enable *Inline-CASB* and select the *outlook_test* profile.
- d. Set the *SSL Inspection* profile to one that uses deep inspection.
- e. Configure the other settings as needed.
- f. Click OK.

To configure an inline CASB profile with privilege control in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
  edit "outlook_test"
    config saas-application
      edit "microsoft-outlook"
        config access-rule
          edit "microsoft-outlook-login"
            set action block
          next
        end
      next
    end
  next
end
next
end
```

2. Configure the firewall policy:

```
config firewall policy
  edit 6
```

```

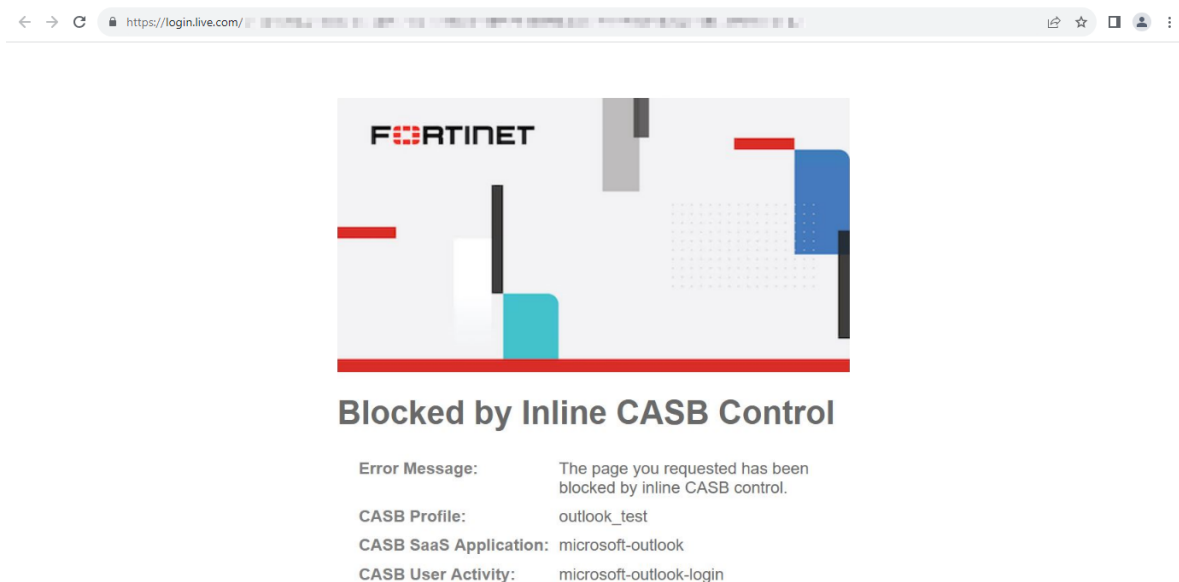

set name "casb_test"
set srcintf "port1"
set dstintf "port3"
set action accept
set srcaddr "all"
set dstaddr "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set ssl-ssh-profile "ssl"
set casb-profile "outlook_test"
set nat enable

next
end

```

To test the configuration:

1. Open a browser and attempt to access the Outlook login page.
2. The traffic is blocked by the firewall policy. The browser displays a replacement message: *Blocked by Inline CASB Control*.

Sample log:

```

1: date=2023-08-18 time=16:59:32 eventtime=1692403171962221884 tz="-0700" logid="2500010000"
type="utm" subtype="casb" eventtype="casb" level="warning" vd="vdom1" msg="CASB access was
blocked because it contained banned activity." policyid=6 sessionid=63635 srcip=10.1.100.195
dstip=20.190.190.130 srcport=61013 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="block" profile="outlook_test"
saasapp="microsoft-outlook" useractivity="microsoft-outlook-login"
activitycategory="activity-control"

```

Example 2: safe search

In this example, safe search is configured for Google in the inline CASB profile.

To configure an inline CASB profile with safe search in the GUI:

1. Configure the inline CASB profile:
 - a. Go to *Security Profiles > Inline-CASB* and click *Create new*.
 - b. Enter a *Name*, such as *google_test*.
 - c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
 - d. Set the *Application* to *google*, then click *Next*.

New Create SaaS Application Rules

Settings Info

Back OK Cancel

f. Click OK.

2. Configure the firewall policy:

- Go to *Policy & Objects > Firewall Policy*. Edit an existing policy, or create a new one.
- Set the *Inspection Mode* to *Proxy-based*.
- In the *Security Profiles* section, enable *Inline-CASB* and select the *google_test* profile.
- Set the *SSL Inspection* profile to one that uses deep inspection.
- Configure the other settings as needed.
- Click OK.

To configure an inline CASB profile with safe search in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
  edit "google_test"
    config saas-application
      edit "google"
        set safe-search enable
        set safe-search-control "strict"
      next
    end
  next
end
```

2. Configure the firewall policy:

```
config firewall policy
  edit 7
    set name "casb_test_google"
    set srcintf "port1"
    set dstintf "port3"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "ssl"
    set casb-profile "google_test"
    set nat enable
  next
end
```

To test the configuration:

1. Open a browser and attempt to search in Google for content that is considered mature or explicit.
2. The sensitive content is filtered out in the search results.

Sample log:

```
1: date=2023-08-18 time=17:01:36 eventtime=1692403295962385271 tz="-0700" logid="2500010002"

```

Example 3: tenant control

In this example, tenant control is configured for Microsoft in the inline CASB profile for the fortinet-us.com domain.

To configure an inline CASB profile with tenant control in the GUI:

1. Configure the inline CASB profile:
 - a. Go to *Security Profiles > Inline-CASB* and click *Create new*.
 - b. Enter a *Name*, such as *microsoft_test*.
 - c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
 - d. Set the *Application* to *microsoft*, then click *Next*.

2. Configure the firewall policy:

- Go to *Policy & Objects > Firewall Policy*. Edit an existing policy, or create a new one.
- Set the *Inspection Mode* to *Proxy-based*.
- In the *Security Profiles* section, enable *Inline-CASB* and select the *microsoft_test* profile.
- Set the *SSL Inspection* profile to one that uses deep inspection.
- Configure the other settings as needed.
- Click **OK**.

To configure an inline CASB profile with tenant control in the CLI:**1. Configure the inline CASB profile:**

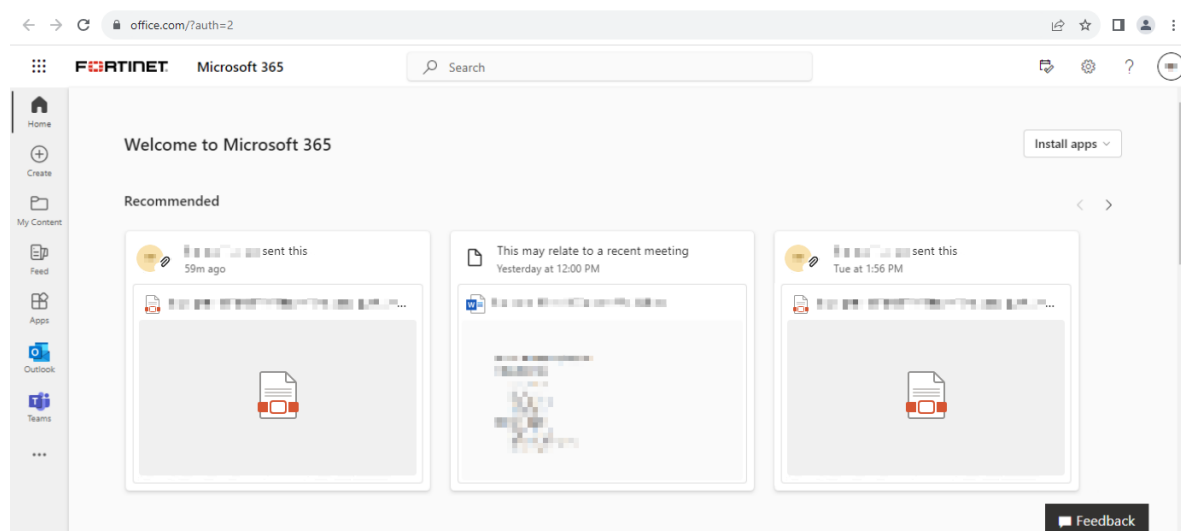

```
config casb profile
  edit "microsoft_test"
    config saas-application
      edit "microsoft"
        set tenant-control enable
        set tenant-control-tenants "fortinet-us.com"
      next
    end
  next
end
```

2. Configure the firewall policy:

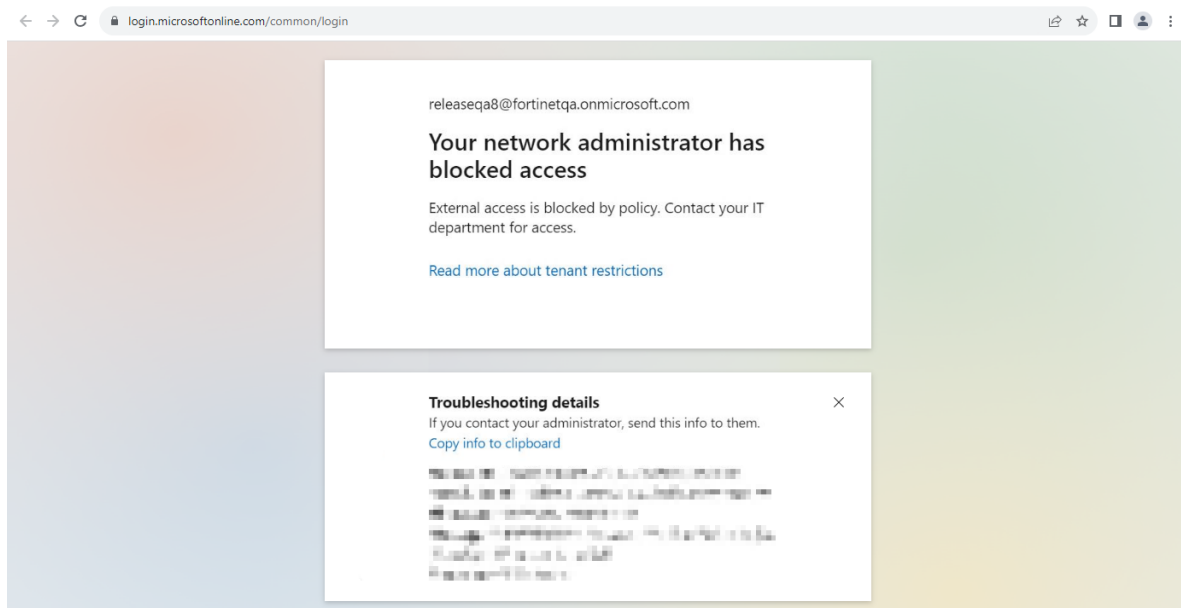

```
config firewall policy
  edit 8
    set name "casb_test_microsoft"
    set srcintf "port1"
    set dstintf "port3"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "ssl"
    set casb-profile "microsoft_test"
    set nat enable
  next
end
```

To test the configuration:

1. Open a browser and attempt to log in to Microsoft Office 365 with a fortinet-us.com account.
2. Since the domain is valid, the user can log in successfully.

3. Attempt to log in to Microsoft Office 365 with another account with a different domain.
4. The domain is invalid. The user is unable to log in, and an error message appears: *Your network administrator has blocked access.*

Sample log:

```
1: date=2023-08-18 time=17:09:25 eventtime=1692403765238967943 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access
was monitored because it contained activity." policyid=8 sessionid=65108 srcip=10.1.100.195
dstip=20.189.173.15 srcport=61912 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="microsoft_test"
saasapp="microsoft" useractivity="ms-tenant-control" activitycategory="tenant-control"
```

Example 4: UTM bypass

In this example, UTM bypass is configured for Dropbox file downloading in the inline CASB profile.

To configure an inline CASB profile with UTM bypass in the GUI:

1. Configure the inline CASB profile:
 - a. Go to *Security Profiles > Inline-CASB* and click *Create new*.
 - b. Enter a *Name*, such as *dropbox_test*.
 - c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
 - d. Set the *Application* to *dropbox*, then click *Next*.

Back OK Cancel

The *Bypass UTM Profile(s)* pane opens.

- g. Click the + and set *Profile(s)* to *File Filter*.

- h. Click **OK** to save the bypass UTM profile.
- i. Click **OK** to save the inline CASB profile
2. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*. Edit an existing policy, or create a new one.
 - b. Set the *Inspection Mode* to *Proxy-based*.
 - c. In the *Security Profiles* section, enable *Inline-CASB* and select the *dropbox_test* profile.
 - d. Set the *SSL Inspection* profile to one that uses deep inspection.
 - e. Configure the other settings as needed.
 - f. Click **OK**.

To configure an inline CASB profile with UTM bypass in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
  edit "dropbox_test"
    config saas-application
      edit "dropbox"
        config access-rule
          edit "dropbox-download-file"
            set bypass file-filter
            set action bypass
          next
        end
      end
    end
```

```

        next
    end
    next
end

```

2. Configure the firewall policy:

```

config firewall policy
    edit 9
        set name "casb_test_dropbox"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "dropbox_test"
        set nat enable
    next
end

```

To test the configuration:

1. Open a browser and log in to Dropbox.
2. Attempt to download a file, such as a PDF. The download is successful.

Sample log:

```

1: date=2023-08-18 time=17:15:29 eventtime=1692404129378193492 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access
was allowed although it contained activity." policyid=9 sessionid=65452 srcip=10.1.100.195
dstip=162.125.1.15 srcport=62110 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="bypass" profile="dropbox_test"
saasapp="dropbox" useractivity="dropbox-download-file" activitycategory="activity-control"

```

Example 5: customized SaaS application and user activity

In this example, a custom SaaS application is created (pc4) with a custom user action. When a user accesses pc4.qa.fortinet.com/virus, they are redirected to pc4.qa.fortinet.com/testweb/testweb.htm.

To configure a customized inline CASB profile in the GUI:

1. Configure the inline CASB profile:
 - a. Go to *Security Profiles > Inline-CASB* and click *Create new*.
 - b. Enter a *Name*, such as *custom_test*.
 - c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
 - d. In the *Application* dropdown, click the + to create a custom entry. The *Create Inline-CASB SaaS Application* pane opens.

- e. Enter the *Name* (*pc4*) and *Domains* (*pc4.qa.fortinet.com*), then click *OK*.

- f. Select *pc4* and click *Next*.
- g. Configure the custom control and action:
- In the *Custom Controls* table, *Create new*. The *Create Custom Control* pane opens.
 - Enter a *Name*, such as *pc4-virus_test_replace*.
 - Set *Apply when HTTP packet matches* to *All of the following*.
 - Enable *URL path* and enter */virus*.

- In the *Application-Defined Controls* table, *Create new*. The *Create Custom Control Action* pane opens.
- Enter a *Name*, such as *virus_replace_operation*.
- Set the *Control Type* to *Edit URL path*.
- Set the *Action* to *Replace path with value*.

- ix. Set the *Path* to */virus*.
- x. Set the *Value* to */testweb/testweb.html*.

Name	virus_replace_operation
Control type	Edit URL path
Action	Replace path with value
Path	/virus
Value	/testweb/testweb.html

- xi. Click *OK* to save the custom action.
- xii. Click *OK* to save the custom control.
- h. Click *OK* to save the application rule.
- i. Click *OK* to save the inline CASB profile.
- 2. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*. Edit an existing policy, or create a new one.
 - b. Set the *Inspection Mode* to *Proxy-based*.
 - c. In the *Security Profiles* section, enable *Inline-CASB* and select the *custom_test* profile.
 - d. Set the *SSL Inspection* profile to one that uses deep inspection.
 - e. Configure the other settings as needed.
 - f. Click *OK*.

To configure a customized inline CASB profile in the CLI:

1. Configure the CASB SaaS application:

```
config casb saas-application
  edit "pc4"
    set domains "pc4.qa.fortinet.com"
  next
end
```

2. Configure the CASB user activity:

```
config casb user-activity
  edit "pc4-virus_test_replace"
    set application "pc4"
    set category other
    config match
      edit 1
        config rules
          edit 1
            set type path
            set match-value "/virus"
          next
        end
      next
    end
  next
end
config control-options
  edit "virus_replace_operation"
    config operations
      edit "virus_replace_operation"
        set target path
        set action replace
        set search-key "/virus"
        set values "/testweb/testweb.html"
      next
    end
  next
end
next
end
```

3. Configure the inline CASB profile:

```
config casb profile
  edit "custom_test"
    config saas-application
      edit "pc4"
        config custom-control
          edit "pc4-virus_test_replace"
            config option
              edit "virus_replace_operation"
            next
          end
        next
      end
    next
  end
next
end
```

4. Configure the firewall policy:

```
config firewall policy
  edit 10
    set name "casb_test_custom"
    set srcintf "port1"
    set dstintf "port3"
    set action accept
    set srcaddr "all"
```

```

        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "custom_test"
        set nat enable
    next
end

```

To test the configuration:

1. Open a browser and go to pc4.qa.fortinet.com/virus.
2. Access is redirected to pc4.qa.fortinet.com/testweb/testweb.htm.

Sample log:

```

1: date=2023-08-21 time=08:31:06 eventtime=1692631866382806917 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access
was allowed although it contained activity." policyid=10 sessionid=3139 srcip=10.1.100.195
dstip=172.16.200.44 srcport=56774 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6
url="http://pc4.qa.fortinet.com/testweb/testweb.html" action="bypass" profile="custom_test"
saasapp="pc4" useractivity="pc4-virus_test_replace" activitycategory="other"

```

Intrusion prevention

Intrusion Prevention System (IPS) detects network attacks and prevents threats from compromising the network, including protected devices. IPS can be in the form of a standalone appliance, or part of the feature set of a Next Generation Firewall (NGFW), such as FortiGate. IPS utilizes signatures, protocol decoders, heuristics (or behavioral monitoring), threat intelligence (such as FortiGuard Labs), and advanced threat detection in order to prevent exploitation of known and unknown zero-day threats. FortiGate IPS is even capable of performing deep packet inspection to scan encrypted payloads in order to detect and prevent threats from attackers.

Networks and devices are often exploited through vulnerabilities. Software vulnerabilities are one such example where a bug or inherent weakness in the code provides attackers an opportunity to gain access to the software. More severe vulnerabilities allow unauthorized access, data leakage, and execution of malicious code. Exploitation of these vulnerabilities can cause damage to the machine and infect others. While the best solution is to patch vulnerabilities as soon as patches are available, IPS signatures offer a solution to detect and block exploitation of many vulnerabilities before they enter the network.

IPS signatures

Fortinet's solution combines industry-leading threat intelligence from FortiGuard Labs with the FortiGate NGFW to identify the latest threats and prevent them from entering your network. IPS signatures are one such method for delivering the latest protection. FortiGuard Labs uses AI and Machine Learning (ML) to analyze billions of events every

day. The FortiGuard Labs research team also proactively performs threat research to discover new vulnerabilities and exploitation, and produces signatures to identify such threats. These IPS signatures are delivered to each FortiGate daily, so that the IPS engine is armed with the latest databases to match the latest threats.

IPS sensors

A FortiGate IPS sensor is a collection of IPS signatures and filters that define the scope of what the IPS engine will scan when the IPS sensor is applied. An IPS sensor can have multiple sets of signatures and/or filters. A set of IPS signatures consists of manually selected signatures, while a set of IPS filters consists of filters based on signature attributes like target, severity, protocol, OS, and application. Each signature has predefined attributes and an action, such as block, allow, monitor (pass), quarantine, and reset. It is also possible to create custom IPS signatures to apply to an IPS sensor.

From the *Security Profiles > Intrusion Prevention* pane, you can create new IPS sensors and view a list of predefined sensors.

FortiOS includes the following predefined IPS sensors with associated predefined signatures:

Predefined IPS sensors	Description
all_default	Filters all predefined signatures, and sets action to the signature's default action.
all_default_pass	Filters all predefined signatures, and sets action to pass/monitor.
default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action.
high_security	Filters all predefined signatures with severity of Critical/High/Medium, and sets action to Block. For Low severity signatures, sets action to signature's default action.
protect_client	Protects against client-side vulnerabilities by filtering on <code>Target=Client</code> . Sets action to signature's default action.
protect_email_server	Protects against email server-side vulnerabilities by filtering on <code>Target=Server</code> and <code>Protocol=IMAP, POP3 or SMTP</code> . Sets action to signature's default action.
protect_http_server	Protects against HTTP server-side vulnerabilities by filtering on <code>Target=Server</code> and <code>Protocol=HTTP</code> . Sets action to signature's default action.
wifi-default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action. Used in profile for offloading WiFi traffic.

DDoS attacks

Besides protecting against threats and exploitation of vulnerabilities, the IPS engine is also responsible for mitigating Denial of Service (DoS) attacks where attackers attempt to bring a service down by flooding the target with traffic from distributed systems. Using anomaly-based defense, FortiGate can detect a variety of L3 and L4 anomalies and take action against these attacks. This can be configured under IPv4 and IPv6 DoS Policies, which is discussed in detail under [DoS policy on page 1212](#).

This section contains the following topics:

- [Signature-based defense on page 1591](#)
- [Configuring an IPS sensor on page 1594](#)

- [IPS configuration options on page 1597](#)
- [IPS signature filter options on page 1602](#)

This section also provides the following examples about IPS sensors:

- [IPS with botnet C&C IP blocking on page 1606](#)
- [IPS signatures for the operational technology security service on page 1610](#)
- [IPS sensor for IEC 61850 MMS protocol on page 1611](#)
- [SCTP filtering capabilities on page 1613](#)

Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access, and this communication includes commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

This section describes the following components used in signature-based defense:

- [IPS signatures on page 1591](#)
- [Protocol decoders on page 1591](#)
- [IPS engine on page 1592](#)
- [IPS sensors on page 1592](#)
- [IPS filters on page 1593](#)
- [Custom and predefined signature entries on page 1593](#)
- [Policies on page 1594](#)

IPS signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information, and FortiGate uses the information to detect and stop attacks.

Signatures also include characteristics about the attack they describe. These characteristics include the network protocol associated with the attack, the vulnerable operating system, and the vulnerable application.

To view the complete list of signatures, go to *Security Profiles > IPS Signatures*. The list of signatures includes predefined and custom signatures. You can hover over the name of the IPS signature to display a pop-up window that includes an ID number. You can click the ID number to display the FortiGuard page.

Protocol decoders

Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.

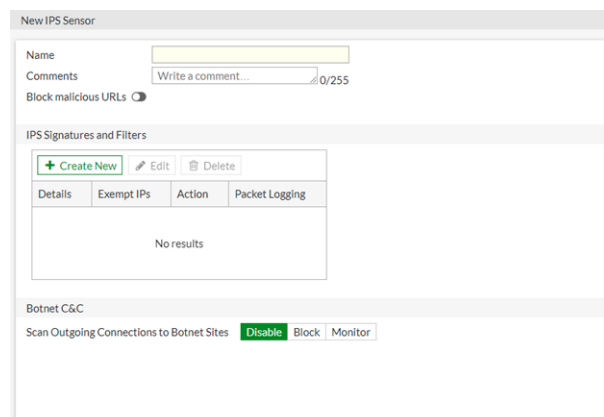

IPS engine

Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures by using IPS sensors.

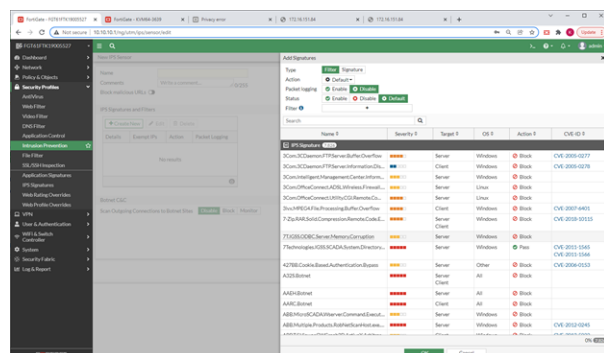

IPS sensors

The IPS engine does not examine network traffic for all signatures. The IPS engine examines network traffic for signatures specified in IPS sensors. You must first create an IPS sensor, and then you can specify what signatures the IPS sensor will use. You can add individual signatures to IPS sensors, or you can add filters to IPS sensors, and the filters automatically include the applicable signatures.

To view IPS sensors, go to *Security Profiles > Intrusion Prevention*. To create a new sensor, click *Create New*.

An IPS sensor is composed of IPS signatures and filters. Under *IPS Signatures and Filters*, click *Create New* to create a set of IPS signatures or a set of IPS filters.

You can create IPS sensors for specific types of traffic, and then select the IPS sensors in firewall policies designed to handle the same type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and select the IPS sensor in a firewall policy that controls all traffic to and from a web server that is protected by the FortiGate unit.

The FortiGuard Service periodically adds new predefined signatures to counter new threats. New predefined signatures are automatically included in IPS sensors that are configured to use filters when the new signatures match existing filter specifications. For example, if you have an IPS sensor with a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures that the FortiGuard Service adds to the database.

IPS signature and filter entries are checked from top down. When a signature is found in a set of signatures or filters, the action defined for the signature is taken.

IPS filters

IPS sensors can contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

Following are the attribute groups:

- Target
- Severity
- Protocol
- OS
- Application

Starting in FortiOS 6.4.2, you can also filter by CVE ID or CVE pattern by using the CLI. See [FortiOS 6.4 New Features > IPS signature filter options](#).

When selecting multiple attributes within the same group, the selections are combined by using a logical **OR**. When selecting multiple attributes between attribute groups, each attribute group is combined by using a logical **AND**.

Once you select filters in the GUI, the filtered list of IPS signatures are displayed. Adjust your filters accordingly to construct a suitable list for your needs.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting OS filter attribute to *Linux*, and the filter attribute *Application* to *Apache*, the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to *Security Profiles > Intrusion Prevention*, select the IPS sensor, and click *Edit*.

Custom and predefined signature entries

Signature entries allow you to add individual, custom or predefined IPS signatures to an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.

To select an individual signature, click a signature, and select *Add Selected*. The signature moves to the *Selected* list.

To select multiple signatures, use the *Search* bar to perform a keyword search, and then click *Add All Results* to move all entries to the *Selected* list.

Overriding the default action

Each IPS signature comes with a default action such as *Block* and *Pass*. In some scenarios, you may want to override this action. You can override a set of IPS filter or signatures. By default, a set of IPS filter or signatures has an action of *Default*, which applies a signature's default action when the signature is matched. By changing the action, you can override the setting for all signatures within the filter or signature set.

Policies

You must select an IPS sensor in a security policy or an interface policy to apply the IPS sensor to traffic. An IPS sensor that is not selected in a policy is not applied to network traffic.

Configuring an IPS sensor

You can configure IPS sensors to be used in policies in the GUI.

To configure an IPS sensor:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.

3. Configure the following settings:

<i>Name</i>	Enter a unique name for the sensor.
<i>Comments</i>	Enter a comment (optional).
<i>Block malicious URLs</i>	Enable to block malicious URLs based on a local malicious URL database on the FortiGate to assist in the detection of drive-by exploits. See Malicious URL database for drive-by exploits detection on page 1598 .
<i>IPS Signature and Filters</i>	Select a signature or filter to assign to the sensor. See Configuring signatures and filters on page 1595 .
<i>Botnet C&C</i>	
<i>Scan Outgoing Connections to Botnet Sites</i>	Define the botnet scanning across traffic that matches the policy: <ul style="list-style-type: none"> • <i>Disable</i>: Do not scan connections to botnet servers. • <i>Block</i>: Block connections to botnet servers. • <i>Monitor</i>: Log connections to botnet servers. See IPS with botnet C&C IP blocking on page 1606 .

4. Click OK.

For information on configuring IPS sensors in the CLI, see [IPS configuration options on page 1597](#).

Configuring signatures and filters

Signatures and filters can be configured and added to IPS sensors. A filter is a collection of signature attributes. Any signatures that meet all of the attributes specified in a filter are automatically included in the IPS sensor. See [IPS signature filter options on page 1602](#).

To configure a Signature entry of type Filter:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

<i>Type</i>	Select <i>Filter</i> .
<i>Action</i>	Click the dropdown menu and select the action when a signature is triggered: <ul style="list-style-type: none"> • <i>Allow</i>: Allow traffic to continue to its destination. • <i>Monitor</i>: Allow traffic to continue to its destination and log the activity. • <i>Block</i>: Drop traffic that matches the signature. • <i>Reset</i>: Reset the session whenever the signature is triggered.

	<ul style="list-style-type: none"> • <i>Default</i>: Use the default action of the signature. Search for the signature in the <i>IPS Signature</i> pane to view the default <i>Action</i>. • <i>Quarantine</i>: Block the matching traffic. Enable packet logging. Quarantine the attacker.
<i>Packet logging</i>	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later.
<i>Status</i>	Define the signature status: <ul style="list-style-type: none"> • <i>Enable</i>: Enable the signature. • <i>Disable</i>: Disable the signature. • <i>Default</i>: Use the default status of the signature. Search for the signature in the <i>IPS Signature</i> pane to view the default <i>Status</i>.
<i>Filter</i>	Select the + to open the <i>Select Entries</i> field and select filter entries. There are different entry categories: <ul style="list-style-type: none"> • <i>Target</i>: Refers to the type of device targeted by the attack. • <i>Severity</i>: Refers to the level of the threat posed by the attack. • <i>Protocol</i>: Refers to the protocol that is the vector for the attack. • <i>OS</i>: Refers to the Operating System affected by the attack. • <i>Application</i>: Refers to the application affected by the attack.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

Individual signatures, custom or predefined IPS signatures can be selected for an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way.

To configure a Signature entry of type Signature:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select Signature.
<i>Action</i>	Click the dropdown menu and select the action when a signature is triggered: <ul style="list-style-type: none"> • <i>Allow</i>: Allow traffic to continue to its destination. • <i>Monitor</i>: Allow traffic to continue to its destination and log the activity. • <i>Block</i>: Drop traffic that matches the signature. • <i>Reset</i>: Reset the session whenever the signature is triggered. • <i>Default</i>: Use the default action of the signature. Search for the signature in the <i>IPS Signature</i> pane to view the default <i>Action</i>. • <i>Quarantine</i>: Block the matching traffic. Enable packet logging. Quarantine the attacker.

Packet Logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later.
Status	Define the signature status: <ul style="list-style-type: none"> • <i>Enable</i>: Enable the signature. • <i>Disable</i>: Disable the signature. • <i>Default</i>: Use the default status of the signature. Search for the signature in the <i>IPS Signature</i> pane to view the default <i>Status</i>.
Rate-based settings	
Default	Use the default rate-based settings.
Specify	Specify the rate-based settings: <ul style="list-style-type: none"> • <i>Threshold</i>: Enter the threshold. See IPS signature rate count threshold on page 1598. • <i>Duration (seconds)</i>: Enter the duration in seconds. • <i>Track By</i>: Select the tracking method as <i>Any</i>, <i>Source IP</i>, or <i>Destination IP</i>.
Exempt IPs	Add IP addresses that are exempt from the signature rules. Click <i>Edit IP Exemptions</i> and click <i>Create New</i> . Edit the <i>Source IP/Netmask</i> and the <i>Destination IP/Netmask</i> to define the IP address for exemption. Click <i>OK</i> to add it to <i>Exempt IPs</i> .

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

IPS configuration options

Besides configuring an IPS filter or selecting IPS signatures for an IPS sensor, you can configure additional IPS options for each sensor or globally for all sensors. This topic introduces the following available configuration options:

- [Malicious URL database for drive-by exploits detection on page 1598](#)
- [IPS signature rate count threshold on page 1598](#)
- [Botnet C&C on page 1599](#)
- [Hardware acceleration for flow-based security profiles \(NTurbo and IPSA\) on page 1599](#)
- [Extended IPS database on page 1600](#)
- [IPS engine-count on page 1600](#)
- [OT threat definitions on page 1600](#)

To configure IPS sensors, signatures, and filters in the GUI, see [Configuring an IPS sensor on page 1594](#).

Malicious URL database for drive-by exploits detection

This feature uses a local malicious URL database on the FortiGate to assist in detection of drive-by exploits, such as adware that allows automatic downloading of a malicious file when a page loads without the user's detection. The database contains all malicious URLs active in the last one month, and all drive-by exploit URLs active in the last three months. The number of URLs controlled are in the one million range.

This feature can be enabled from an IPS sensor in the GUI by going to *Security Profiles > Intrusion Prevention* and editing or creating an IPS Sensor, then enabling *Block malicious URLs*. See [Configuring an IPS sensor on page 1594](#).

To enable the blocking of malicious URLs in the CLI:

```
config ips sensor
    edit <profile>
        set block-malicious-url {enable | disable}
    next
end
```

Blocking malicious URLs is not supported on some FortiGate models, such as FortiGate 51E, 50E, or 30E.

IPS signature rate count threshold

You can use the IPS signature rate-based settings to specify a rate count threshold that must be met before the signature is triggered. A rate count threshold provides a more controlled recording of attack activity. For example, if multiple login attempts produce a failed result over a short period of time, then an alert would be sent and traffic might be blocked, which is a more manageable response than sending an alert every time a login fails.

This can be configured from the GUI by going to *Security Profiles > Intrusion Prevention*. Create or edit an IPS sensor. Within the sensor, edit the IPS signatures and filters. Only IPS signatures have the rate-based settings option. IPS filters do not. See [Configuring an IPS sensor on page 1594](#).

Some settings are only available in the CLI.

To configure the IPS signature rate-based settings in the CLI:

```
config ips sensor
    edit <sensor>
        config entries
            edit <filter ID number>
                set rule <ids>
                set rate-count <integer>
                set rate-duration <integer>
                set rate-mode {continuous | periodical}
                set rate-track {none | src-ip | dest-ip | dhcp-client-mac | dns-domain}
            next
        end
    next
end
```

<code>rule <ids></code>	The predefined or custom IPS signatures to add to the sensor.
<code>rate-count <integer></code>	The count of the rate (0 - 65535, default = 0). The rate-count must be configured before the other rate settings can be set.
<code>rate-duration <integer></code>	Duration of the rate, in seconds (0 - 65535, default = 60)
<code>rate-mode {continuous periodical}</code>	How the count threshold is met. <ul style="list-style-type: none"> <code>continuous</code>: If the action is set to block, the action is engaged as soon as the rate-count is reached. For example, if the count is 10, the traffic would be blocked as soon as the signature is triggered 10 times. This is the default. <code>periodical</code>: The FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.
<code>rate-track {none src-ip dest-ip dhcp-client-mac dns-domain}</code>	Track one of the protocol fields within the packet (default = none).

Botnet C&C

See [IPS with botnet C&C IP blocking on page 1606](#) for information on configuring settings in the CLI.

Hardware acceleration for flow-based security profiles (NTurbo and IPSA)

Some FortiGate models support a feature call NTurbo that can offload flow-based firewall sessions to network processors. See also [NTurbo offloads flow-based processing](#) in the Hardware Acceleration Guide. For IPSA enhanced pattern matching, see [IPSA offloads flow-based advanced pattern matching](#) in the Hardware Acceleration Guide.

Some FortiGate models also support offloading enhanced pattern matching for flow-based security profiles to CP8 or CP9 content processors.

To configure NTurbo and IPSA:

```
config ips global
    set np-accel-mode {none | basic}
    set cp-accel-mode {none | basic | advanced}
end
```

If the `np-accel-mode` option is available, your FortiGate supports NTurbo. The `none` option disables NTurbo, and `basic` (the default) enables NTurbo.

If the `cp-accel-mode` option is available, your FortiGate supports IPSA. The `none` option disables IPSA, and `basic` enables basic IPSA, and `advanced` enables enhanced IPSA, which can offload more types of pattern matching than basic IPSA. The `advanced` option is only available on FortiGate models with two or more CP8 processors, or one or more CP9 processors.

Extended IPS database

Some models have access to an extended IPS Database. Because the extended database may affect FortiGate performance, the extended database package may be disabled by default on some models, such as desktop models.

You can only enable the extended IPS database by using the CLI.

To enable the extended IPS database:

```
config ips global
    set database extended
end
```

FortiGate models with the CP9 SPU receive the IPS full extended database, and the other physical FortiGate models receive a slim version of the extended database. The slim-extended DB is a smaller version of the full extended DB that contains top active IPS signatures. It is designed for customers who prefer performance.

Customers with non-CP9 SPU models need to upgrade to a CP9 SPU model (physical FortiGate) in order to get full IPS signature coverage. All FortiGate models 200 (E and F) and higher have a CP9 SPU.

See [Determining the content processor in your FortiGate unit](#) in the FortiOS Hardware Acceleration Guide to check if your device has a CP9 SPU.

FortiGate VMs with eight or more vCPUs can be configured to have a minimum of eight cores to be eligible to run the full extended database. Any FortiGate VM with less than eight cores will receive a slim version of the extended database.

IPS engine-count

FortiGate units with multiple processors can run one or more IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines to use at the same time.

To specify the number of concurrent IPS engines running:

```
config ips global
    set engine-count <int>
end
```

The recommended and default setting is 0, which allows the FortiGate unit to determine the optimum number of IPS engines.

OT threat definitions

Operational Technology (OT) threat definitions are defined to protect Industrial Control Systems (ICS), Operational Technology (OT) and SCADA systems, which are critical infrastructure used by manufacturing industries. An OT Security Service license is required to use this signature database. These signatures are excluded by default, but can be configured in the CLI.

Enabling the OT threat definitions may impact IPS performance, since this increases the number of signatures to scan. To optimize IPS performance, enable only IPS signature packages that are needed.

To configure OT signatures:

```
config ips global
    set exclude-signatures {none | ot}
end
```

Fail-open

A fail-open scenario is triggered when IPS raw socket buffer is full. Therefore IPS engine has no space in memory to create more sessions and needs to decide whether to drop the sessions or bypass the sessions without inspection.

To enable fail-open mode:

```
config ips global
    set fail-open {enable | disable}
end
```

The default setting is `disable`, so sessions are dropped by IPS engine when the system enters fail-open mode.

When enabled, the IPS engine fails open, and it affects all protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, and so on. When the IPS engine fails open, traffic continues to flow without IPS scanning.

Sessions offloaded to Nturbo do not support fail-open. When Nturbo data path is overloaded, traffic is dropped regardless of fail-open setting.

IPS buffer size

If system enters fail-open mode frequently, it is possible to increase the IPS socket buffer size to allow more data buffering, which reduces the chances of overloading the IPS engine. You can set the size of the IPS buffer.

To set the socket buffer size:

```
config ips global
    set socket-size <int>
end
```

The default socket size and maximum configurable value varies by model. In short, `socket-size` determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Take caution when modifying the default value. If the `socket-size` is too large, the higher memory used by the IPS engine may cause the system to enter conserve mode more frequently. If set too low, the system may enter IPS fail-open mode too frequently.

Session count accuracy

The IPS engine can track the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

To configure the IPS open session count mode:

```
config ips global
    set session-limit-mode {accurate | heuristic}
end
```

The default is `heuristic`.

Protocol decoders

The FortiGate Intrusion Prevention system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI.

To configure protocol decoder ports:

```
config ips decoder dns_decoder
    config parameter "port_list"
        set value "100,200,300"
    end
end
```

In this example, the ports examined by the DNS decoder were changed from the default 53 to 100, 200, and 300.

You cannot assign specific ports to decoders that are set to *auto* by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

IPS signature filter options

IPS signature filter options include hold time, CVE pattern, and IPS sensor attributes.

Hold time

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 7 days, in the format `##d##h`.

To configure the amount of time to hold and monitor IPS signatures:

```
config system ips
    set signature-hold-time 3d12h
```

```
set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold`:

```
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1278399657778481842 tz="-0700"
severity="info" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" sessionid=3620
action="detected" proto=6 service="HTTP" policyid=1 attack="Eicar.Virus.Test.File"
srcport=52170 dstport=80 hostname="172.16.200.55" url="/virus/eicar" direction="incoming"
attackid=29844 profile="test" ref="http://www.fortinet.com/ids/VID29844"
incidentserialno=25165825 msg="file_transfer: Eicar.Virus.Test.File, (signature is on hold)"
```

To view signatures being held by rule ID 29844 on the VDOM:

```
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
```

To view all help signatures on the VDOM:

```
# diagnose ips signature on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```

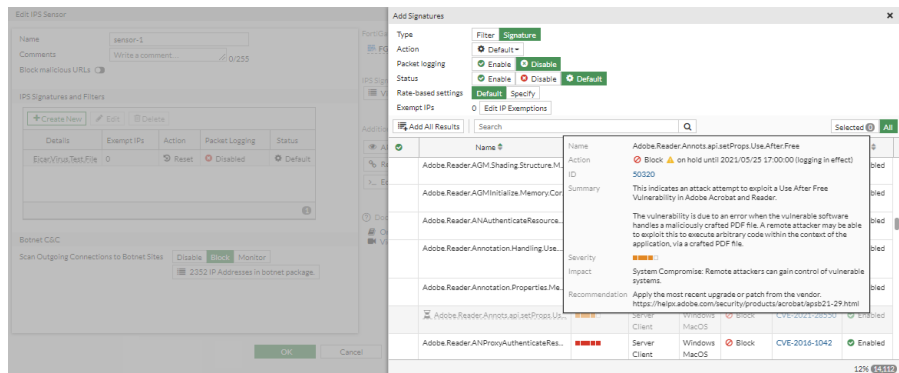

Viewing on hold information in the GUI

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry time and other details.

On the *Security Profiles > IPS Signatures* page, for example, the *Adobe.Reader.Annots.api.setProps.Use.After.Free* signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry. On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.

The same tooltip is available on the *Edit IPS Sensor (Security Profiles > Intrusion Prevention)* page when creating or editing the IPS signatures. In the *Add Signatures* pane when the *Type* is *Signature*, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.

You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.

CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
  edit "cve"
    set comment "cve"
    config entries
      edit 1
        set cve "cve-2010-0177"
        set status enable
        set log-packet enable
        set action block
      next
      edit 2
        set cve "cve-2017"
        set action reset
      next
    end
  next
end
```

For example, the CVE of the IPS signature *Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution* is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```
date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700"
```

```
severity="critical" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=1638 action="dropped" proto=6 service="HTTPS" policyid=1
attack="Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution" srcport=58298 dstport=443
hostname="172.16.200.55" url="/Mozilla" direction="incoming" attackid=20853 profile="sensor-1"
ref="http://www.fortinet.com/ids/VID20853" incidentserialno=124780667 msg="web_client: Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution," crscore=50 craction=4096
crlevel="critical"
```

IPS sensor attributes

When configuring IPS sensor profiles, IPS signatures can be filtered based on the attributes: default status, default action, vulnerability type, and the last update date. When monitoring the specific, filtered signatures, logs are not generated for other, irrelevant signatures.

This avoids generating a lot of false positives due to many signatures having the pass action, which is never logged.

To configure filters in an IPS sensor profile:

```
config ips sensor
  edit "test_default"
    config entries
      edit 1
        set default-action pass
        set default-status enable
        set vuln-type 12
        set last-modified before 2020/02/02
      next
    end
  next
end
```

default-action {pass block all}	Filter by signatures' default actions (default = all).
default-status {enable disable all}	Filter by signatures' default statuses (default = all).
vuln-type <integer> ... <integer>	Filter by signatures' vulnerability types.
last-modified {before after between} <date> [end-date]	Filter by signatures' last modified date (default = before 00/00/00). The date format is yyyy/mm/dd. The year range is 2001 - 2050.

When the IPS profile is used in a firewall profile and then the EICAR virus test file signature is triggered, the signature matches the values set in the filter and logs are generated:

```
1:date=2022-02-15 time=14:07:03 eventtime=1644962823303491048 tz="-0800" logid="0419016384"

IPS with botnet C&C IP blocking

The *Botnet C&C* section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

To configure botnet C&C IP blocking in the GUI:

1. Go to *Security Profiles > Intrusion Prevention*, and click *Create New* to create a new IPS sensor, or double-click an existing IPS sensor to open it for editing.
2. Navigate to the *Botnet C&C* section.
3. For *Scan Outgoing Connections to Botnet Sites*, select *Block* or *Monitor*.

4. Configure the other settings as needed.
5. Click *OK* to save the IPS sensor.

6. Add the IPS sensor to a firewall policy.

The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP address, an IPS log is generated for this attack.

7. Go to *Log & Report > Security Events* and click the *Intrusion Prevention* card to view the log.**To configure botnet C&C IP blocking in the CLI:**

```
config ips sensor
  edit "Demo"
    set scan-botnet-connections {disable | block | monitor}
  next
end
```

The `scan-botnet-connections` option is no longer available in the following CLI commands:

- `config firewall policy`
- `config firewall interface-policy`
- `config firewall proxy-policy`
- `config firewall sniffer`

Sample log

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.
```

```
1: date=2022-04-28 time=16:18:34 eventtime=1651187914585406621 tz="-0700" logid="0422016400"

crlevel="critical"
```

Botnet IPs and domains lists**To view botnet IPs and domains lists:**

1. Go to *System > FortiGuard*.
2. Expand *License Information > Intrusion Prevention* to view *Botnet IPs* and *Botnet Domains* information.

3. Click *View List* for more details.

The screenshot displays the FortiGuard Distribution Network interface. On the left, the 'License Information' section lists various entitlements and their status:

Entitlement	Status	Actions
FortiCare Support	Registered	Actions
Virtual Machine	Valid (Expiration Date: 2021/10/02)	FortiGate VM License
Firmware & General Updates	Licensed (Expiration Date: 2022/10/02)	
Intrusion Prevention	Licensed (Expiration Date: 2022/10/02)	
IPS Definitions	Version 17.00004	Actions
IPS Engine	Version 6.00064	
Malicious URLs	Version 2.00896	
Botnet IPs	Version 7.01307	View List
Botnet Domains	Version 2.00670	View List
AntiVirus	Licensed (Expiration Date: 2022/10/02)	
Web Filtering	Licensed (Expiration Date: 2022/10/02)	
Outbreak Prevention	Licensed (Expiration Date: 2022/10/02)	
SD-WAN Network Monitor	Licensed (Expiration Date: 2022/10/02)	
Security Rating	Licensed (Expiration Date: 2022/10/02)	
Industrial DB	Licensed (Expiration Date: 2022/10/02)	
FortiPAM	Licensed (Expiration Date: 2022/10/02)	
IoT Detection Service	Licensed (Expiration Date: 2022/10/02)	
FortiGate Cloud	Not Activated	Activate

Below the license list, there is an 'Enter Registration Code' field and a 'FortiGuard Updates' section with a toggle for 'Accept push updates'.

On the right, the 'Fortinet Service Communications' section shows a table of services and their traffic volume (Last 24 hours):

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	0 B
FortiGuard.com	545.12 kB
FortiGuard Download	45.51 MB
FortiGuard Query	14.97 kB
FortiSandbox Cloud	0 B
OCVPN	0 B
SDNS	71.37 kB
FortiToken Registration	0 B
SMS Service	0 B

Below the table, there is a 'Documentation' section with links to 'Online Help', 'Video Tutorials', and 'How to Purchase/Renew Fortinet Service Subscriptions'.

Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to *Security Profiles > DNS Filter*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Redirect botnet C&C requests to Block Portal*.

The screenshot displays the 'Edit DNS Filter Profile' interface. The 'Name' field is set to 'default' and the 'Comments' field contains 'Default dns filtering.' with a character count of 22/255. The 'Redirect botnet C&C requests to Block Portal' toggle is enabled, and a tooltip indicates '55225 domains in botnet package'. The 'Enforce 'Safe Search' on Google, Bing, YouTube' toggle is disabled.

The 'FortiGuard Category Based Filter' section shows a table of categories and their actions:

Name	Action
Adult/Mature Content (15)	15
Alternative Beliefs	Monitor
Abortion	Monitor
Other Adult Materials	Monitor
Advocacy Organizations	Monitor
Gambling	Monitor
Nudity and Risque	Monitor
Pornography	Monitor
Dating	Monitor

The 'Static Domain Filter' section shows the 'Domain Filter' toggle is disabled, 'External IP Block Lists' is disabled, and 'DNS Translation' is enabled.

3. Configure the other settings as needed.

4. Click **OK**.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to *Security Profiles > Intrusion Prevention*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Block malicious URLs*.

5. Add the sensor to a firewall policy.

Botnet C&C signature blocking

To add IPS signatures to a sensor:

1. Go to *Security Profiles > Intrusion Prevention*, and click *Create New*, or double-click an existing sensor to open it for editing.
2. In the *IPS Signatures and Filters* section, click *Create New*. A list of available signatures appears.
3. For *Type*, select *Signature*. Select the signatures you want to include from the list.
4. Configure the other settings as needed.

5. Click **Add Selected**.

The screenshot shows the 'Add Signatures' dialog in the FortiGate GUI. The dialog has a left sidebar with 'New IPS Sensor' and 'IPS Signatures and Filters' sections. The main area displays a table of signatures. The 'Add Selected' button is highlighted in green.

Name	Severity	Target	OS	Action	CVE-ID
427BB.Cookie.Based.Authentication.Bypass	High	Server	Other	Block	CVE-2006-0153
A32S.Botnet	High	Server Client	All	Block	
AAEH.Botnet	High	Server	All	Block

ACME.mini_httpd.Arbitrary.File.Read	High	Server	Linux	Block	CVE-2018-18778
ACT.IASOC.Web.Configurator.Remote.Co...	High	Server	Other	Block	
ACTI.Network.Video.Controller.ActiveX.Co...	High	Client	Windows	Block	CVE-2007-4583
ACTI.Network.Video.Controller.ActiveX.Set...	High	Client	Windows	Block	CVE-2007-4582
ACal.Arbitrary.Command.Execution	High	Server	Windows Linux BSD Solaris MacOS	Block	CVE-2006-2261

6. Click **OK** to add the IPS signatures to the IPS sensor.7. Click **OK** to save the IPS sensor.

8. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

IPS signatures for the operational technology security service

The FortiGuard Operational Technology (OT) includes both application control and intrusion prevention signatures for industrial applications and protocols. The OT attack definitions are only updated if the FortiGate has a valid OT Security Services license and an IPS security profile is used in a policy.

By default, OT signatures are excluded from the signature lists in the GUI.

To verify that the FortiGate has a valid OT Security Service license:

1. Go to *System > FortiGuard*.
2. In the *License Information* table, check the license status of *Operational Technology (OT) Security Service*.
3. Expand the *Operational Technology (OT) Security Service* entry to see the current versions.

To force the industrial DB attack definitions to update:

1. Optionally, create an IPS profile:
 - a. Go to *Security Profiles > Intrusion Prevention* and click *Create New*.
 - b. Enter a name for the profile.
 - c. In the *IPS Signatures and Filters* table click *Create New*.
 - d. Click **OK**.
 - e. Click **OK**.

See [Intrusion prevention on page 1589](#) for more information.

2. Use the IPS profile in a policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Edit an existing policy, or click *Create New* to create a new policy.
 - c. Under *Security Profiles*, enable *IPS* and select an IPS profile.
 - d. Configure the remaining settings as needed, then click *OK*.
3. Go to *System > FortiGuard* and either click *Update Licenses & Definitions Now*, or wait for the next automatic update. The update could take a few minutes.
4. Refresh the page, then check the *Operational Technology (OT) Security Service* versions to confirm that they have been updated.

To make OT IPS and application control signatures available in the GUI:

```
config ips global
    set exclude-signatures none
end
```

To view the signatures in the GUI:

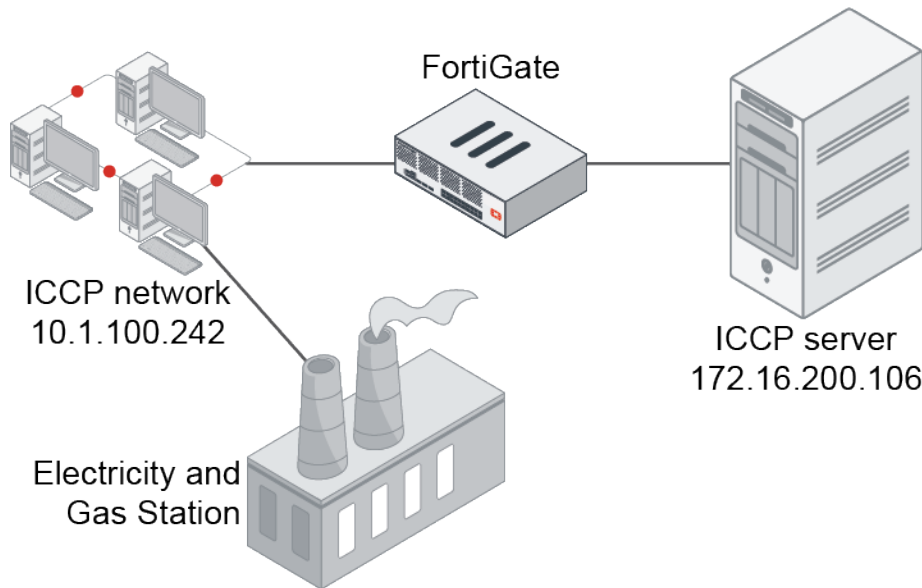

1. Go to *Security Profiles > Application Signatures* and to find signatures that identify OT protocols.
2. Go to *Security Profiles > IPS Signatures* to find signatures that detect networks attacks that target OT assets.

IPS sensor for IEC 61850 MMS protocol

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.

OT signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, OT signatures are excluded.

```
config ips global
    set exclude-signatures {none | ot}
end
```

Below are some OT signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort
- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values
- ICCP_Get.Next.DSTransfer.Set.Value
- ICCP_Delete.Dataset
- ICCP_Start.Transfer.IMTransferSet

Diagnose command

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
```

```
[284@78]ips_l7_dsct_processor: serial=8142 create: cotp
[284@78]ips_l7_dsct_processor: serial=8142 create: iec104
[284@78]ips_l7_dsct_processor: serial=8142 create: modbus
```

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

Log samples:

```
date=2023-07-27 time=15:40:04 eventtime=1690497604271242607 tz="-0700" logid="1059028704"

```

SCTP filtering capabilities

A Stream Control Transmission Protocol (SCTP) dissector and Payload Protocol Identifier (PPID) filter can be used to either terminate the SCTP session, or replace the offending data chunk with zeros to keep the client and server sequence numbers synchronized. The SCTP filter action can also pass the data chunk.

To configure and test an SCTP filter:

1. Configure an SCTP filter profile that uses the reset action:

```
config sctp-filter profile
  edit "sctp"
    set comment "Demo profile"
    config ppid-filters
      edit 1
        set ppid 112233
        set action reset
        set comment "test chunk"
      next
    end
  next
end
```

2. Use the SCTP filter profile in a firewall policy:

```
config firewall policy
  edit 1
```

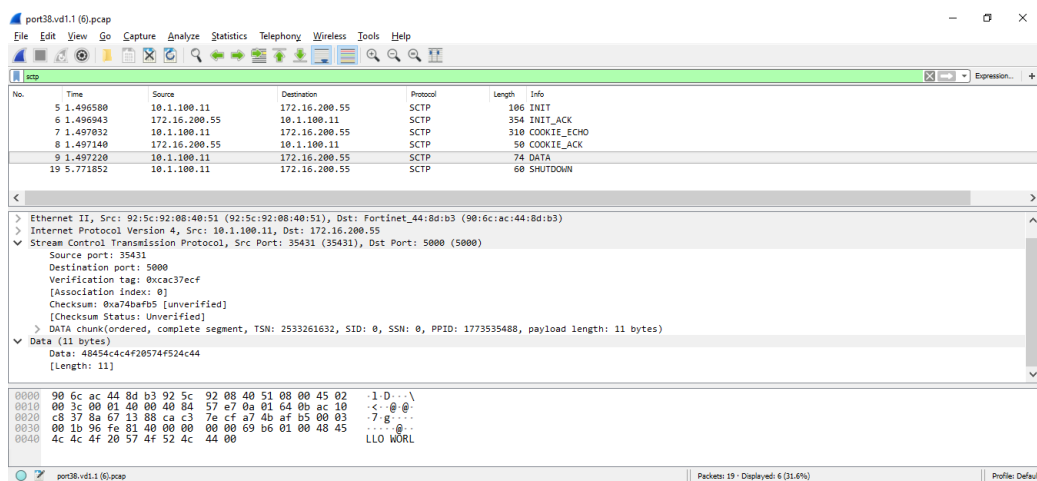

```

set name "1"
set srcintf "port38"
set dstintf "port37"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set utm-status enable
set ssl-ssh-profile "new-deep-inspection"
set sctp-filter-profile "sctp"
set logtraffic all

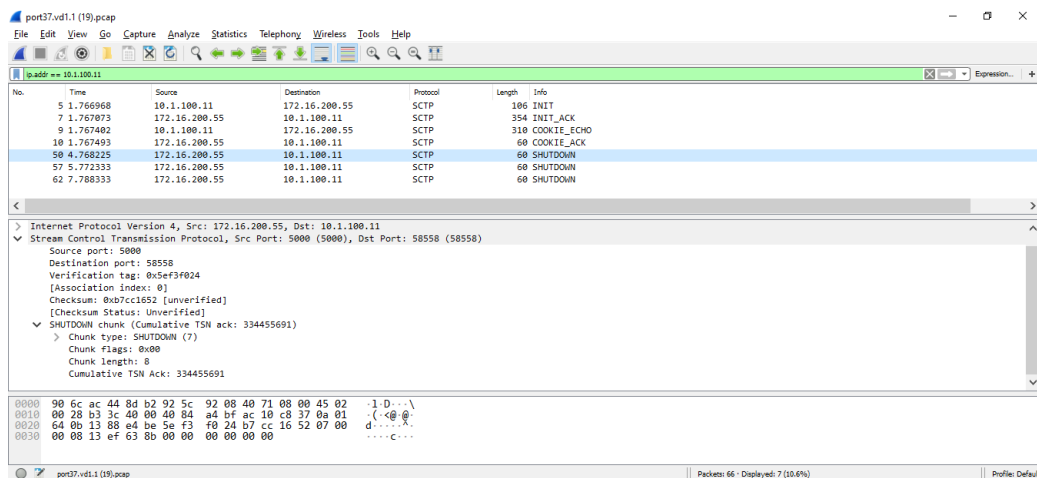

next
end

```

3. On the SCTP client, confirm that the connection works and send a data chunk with PPID 112233.

4. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is reset, so the data chunk is not received on the server, and the session is terminated.

5. Change the filter action to replace:

```

config sctp-filter profile
edit "sctp"
config ppid-filters

```

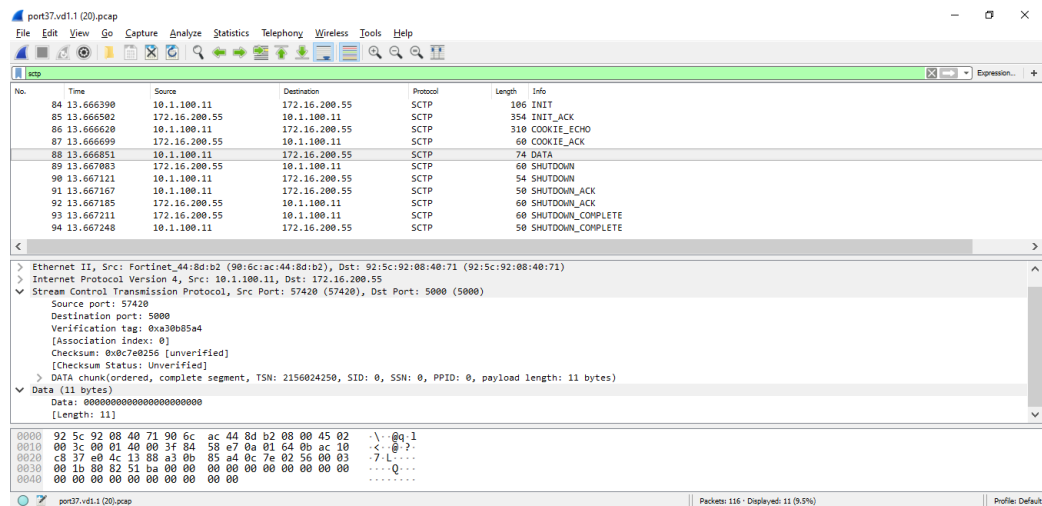

```

edit 1
    set action replace
next
end
next
end

```

6. Resend the data chunk.

7. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is replace, so the data chunk is replaced with zeros.

File filter

A file filter can be configured to control the flow of different types of files passing through FortiGate. This is done by setting up rules that specify which file types are allowed or blocked. The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode. The feature set setting (proxy or flow) in the file filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based file filter profile must be used with a flow-based firewall policy.

Prior to FortiOS 6.4.1, file filter was embedded in the web filter, email filter, SSH inspection, and CIFS profiles.

Protocol	Proxy mode	Flow mode
CIFS	Yes	Yes
FTP	Yes	Yes
HTTP	Yes	Yes
IMAP	Yes	Yes

Protocol	Proxy mode	Flow mode
MAPI	Yes	No
POP3	Yes	Yes
SMTP	Yes	Yes
SSH	Yes	No

File filtering is based only on the file type (file meta data) and not on file size or content. A DLP dictionary, sensor, and profile would need to be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regular expressions (see [Basic DLP settings on page 1683](#) for more information).

The following options can be configured in a file filter profile:

GUI option	CLI option	Description
Basic profile settings		
<i>Name</i>	<code>name <string></code>	Enter a unique name for the profile.
<i>Comments</i>	<code>comment <var-string></code>	Enter a comment (optional).
<i>Scan archive contents</i>	<code>scan-archive-contents {enable disable}</code>	Enable to scan archive contents.
<i>Feature set</i>	<code>feature-set {flow proxy}</code>	<p>Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.</p> <ul style="list-style-type: none"> • <i>Flow-based</i> • <i>Proxy-based</i> <p>If the <i>Feature set</i> option is not visible in the GUI, enter the following in the CLI:</p> <pre>config system settings set gui-proxy-inspection enable end</pre>
n/a	<code>log {enable disable}</code>	Enable to use file filter logging. This setting is enabled by default.
n/a	<code>extended-log {enable disable}</code>	Enable to use file filter extended logging. This setting is disabled by default.
n/a	<code>replacemsg-group <string></code>	Set a replacement message group.
File filter rule settings		
<i>Name</i>	<code>name <string></code>	Enter a unique name for the rule.
<i>Comments</i>	<code>comment <var-string></code>	Enter a comment (optional).

GUI option	CLI option	Description
<i>Protocols</i>	<code>protocol {option1}, {option2}, ...</code>	Set the protocols to apply to the rule. By default, all protocols are configured: CIFS, FTP, HTTP, IMAP, POP3, and SMTP in flow mode. Additionally, MAPI and SSH are configured by default in proxy mode.
<i>Traffic</i>	<code>direction {incoming outgoing any}</code>	Set the traffic direction: <ul style="list-style-type: none"> • <i>Incoming</i>/<i>incoming</i>: match files transmitted in the session's reply direction. • <i>Outgoing</i>/<i>outgoing</i>: match files transmitted in the session's originating direction. • <i>Both</i>/<i>any</i>: match files transmitted in the session's originating and reply directions.
<i>Password-protected only</i>	<code>password-protected {yes any}</code>	Enable (<i>yes</i>) to match password-protected files. If the setting is not enabled, any file is matched.
<i>File types</i>	<code>file-type <name1>, <name2>, ...</code>	Select the file type. See Supported file types on page 1621 for the list of available options.
<i>Action</i>	<code>action {log-only block}</code>	Set the action to take for a matched file: <ul style="list-style-type: none"> • <i>Monitor</i>/<i>log-only</i>: allow the content and write a log message. • <i>Block</i>/<i>block</i>: block the content and write a log message.

Configuring a file filter profile

In this example, a flow-based file filter is created that has two rules.

- Rule 1: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to monitor any matched .NET, 7-Zip, ActiveMime, ARJ, ASPack, AVI, Base64, Windows batch, BinHex, BMP, Bzip, and Bzip2 files transmitted in the session's originating and reply directions.
- Rule 2: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to block any matched SIS, TAR, TIFF, torrent, UPX, UUE, WAV, WMA, ZAR archive, XZ, and ZIP files transmitted in the session's originating direction.

To configure a file filter in the GUI:

1. Configure the filter profile:
 - a. Go to *Security Profiles > File Filter* and click *Create New*.
 - b. Enter a name.
 - c. Set the *Feature set* to *Flow-based*.
 - d. In the *Rules* table, click *Create New*.
 - e. Configure rule 1 as follows:

Name	r1
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Both
Password-protected only	Deselect
File types	.net, 7z, activemime, arj, aspack, avi, base64, bat, binhex, bmp, bzip, bzip2
Action	Monitor

- f. Click *OK* to save the rule.
- g. In the *Rules* table, click *Create New* and configure rule 2 as follows:

Name	r2
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Outgoing
Password-protected only	Deselect
File types	sis, tar, tiff, torrent, upx, uue, wav, wma, xar, xz, zip
Action	Block

Create New File Filter Rule

Name: r2

Comments: Write a comment... (0/255)

Protocols: CIFS, FTP, HTTP, IMAP, POP3, SMTP (all selected)

Traffic: Incoming, **Outgoing**, Both

Match Files

Password-protected only: ☐

File types: sis, tar, tiff, torrent, upx, uue, wav, wma, xar, xz, zip (all selected)

Action: ☐ Monitor, **☒ Block**

OK Cancel

- h. Click *OK* to save the rule.
- i. Click *OK* to save the filter profile.

2. Apply the filter to a policy:

- Go to **Policy & Objects > Firewall Policy** and edit an existing policy or create a new one.
- In the **Security Profiles** section, enable **File Filter**.
- Select the filter from the dropdown box (**test**).
- Configure the other settings as needed.
- Click **OK**.

To configure a file filter in the CLI:

1. Configure the file filter profile:

```
config file-filter profile
edit "test"
set comment ''
set feature-set flow
set replacemsg-group ''
set log enable
set scan-archive-contents enable
config rules
edit "r1"
set comment ''
set protocol http ftp smtp imap pop3 cifs
set action log-only
set direction any
set password-protected any
set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64"
"bat" "binhex" "bmp" "bzip" "bzip2"
next
edit "r2"
set comment ''
set protocol http ftp smtp imap pop3 cifs
set action block
set direction outgoing
set password-protected any
set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar"
"xz" "zip"
```

```
        next
    end
    next
end
```

2. Apply the filter to a policy:

```
config firewall policy
    edit 1
        set name "filefilter-policy"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set file-filter-profile "test"
        set auto-asic-offload disable
        set np-acceleration disable
        set nat enable
    next
end
```

To view file filter logs in the GUI:

1. Go to *Log & Report > Security Events*.
2. Select the *File Filter* card.

To view file filter logs in the CLI:

```
# execute log filter category utm-file-filter
# execute log display
```

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP profile must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

Type	Description
.net	Match .NET files
7z	Match 7-Zip files
activemime	Match ActiveMime files
arj	Match ARJ compressed files

Type	Description
aspack	Match ASPack files
avi	Match AVI files
base64	Match Base64 files
bat	Match Windows batch files
binhex	Match BinHex files
bmp	Match BMP files
bzip	Match Bzip files
bzip2	Match Bzip2 files
cab	Match Windows CAB files
chm	Match Windows compiled HTML help files
class	Match CLASS files
cod	Match COD files
crx	Match Chrome extension files
dmg	Match Apple disk image files
elf	Match ELF files
exe	Match Windows executable files
flac	Match FLAC files
fsg	Match FSG files
gif	Match GIF files
gzip	Match Gzip files
hlp	Match Windows help files
hta	Match HTA files
html	Match HTML files
iso	Match ISO archive files
jad	Match JAD files
javascript	Match JavaScript files
jpeg	Match JPEG files
lzh	Match LZH compressed files
mach-o	Match Mach object files
mime	Match MIME files

Type	Description
mov	Match MOV files
mp3	Match MP3 files
mpeg	Match MPEG files
msi	Match Windows Installer MSI Bzip files
msoffice	Match MS-Office files. For example, DOC, XLS, PPT, and so on.
msofficex	Match MS-Office XML files. For example, DOCX, XLSX, PPTX, and so on.
pdf	Match PDF files
petite	Match Petite files
png	Match PNG files
rar	Match RAR archives
rm	Match RM files
sis	Match SIS files
tar	Match TAR files
tiff	Match TIFF files
torrent	Match torrent files
unknown*	Match unknown files
upx	Match UPX files
uue	Match UUE files
wav	Match WAV files
wma	Match WMA files
xar	Match XAR archive files
xz	Match XZ files
zip	Match ZIP files

* This file type is only available in DLP profiles.

Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- Local options: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- FortiGuard-based options: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- Third-party options: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

	SMTP	POP3	IMAP	MAPI
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

The following topics provide information about email filter profiles:

- [Configuring an email filter profile on page 1624](#)
- [Local-based filters on page 1625](#)
- [FortiGuard-based filters on page 1632](#)
- [Third-party-based filters on page 1634](#)
- [Filtering order on page 1635](#)
- [Protocols and actions on page 1636](#)
- [Configuring webmail filtering on page 1638](#)

Configuring an email filter profile

Email filters can be configured to perform spam detection and filtering.

To configure an email filter profile:

1. Go to *Security Profiles > Email filter* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).
<i>Enable spam detection and filtering</i>	Enable/disable spam detection and filtering.
<i>Spam Detection by Protocol</i>	Configure settings for SMTP, POP3, IMAP, and MAPI protocols. See Protocols and actions on page 1636 and Filtering order on page 1635 for more information.
<i>FortiGuard Spam Filtering</i>	The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing and spam URLs, known spam email checksums, and others. See FortiGuard-based filters on page 1632 for more information.
<i>Local Spam Filtering</i>	Enable and configure local spam filters. See Local-based filters on page 1625 for more information.

3. Click OK.

Local-based filters

There are six types of local spam filters:

- [HELO DNS lookup](#)
- [Return email DNS check](#)
- [Block/allow list](#)
- [Banned words](#)*
- [Trusted IP addresses](#)*
- [MIME header](#)*

* These filters can only be configured in the CLI.

By default, HELO DNS and return email DNS checks are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, configure the following to give precedence to the block/allow list:

```
config emailfilter profile
    edit <name>
        config smtp
            set local-override enable
        next
    end
end
```

HELO DNS lookup and return email DNS checking are not supported while in flow-based inspection mode. See [Inspection mode feature comparison on page 1428](#).

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam. The HELO DNS lookup is only available for SMTP traffic.

Return email DNS check

The FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam. When return email DNS checking is enabled, the FortiGate takes the domain in the reply-to email address and reply-to domain, and checks the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, the FortiGate treats the email as spam.

Block/allow list

Block/allow lists can be made from emails or IP subnets to forbid or allow them to send or receive emails. The following table summarizes the configurable options in a block/allow list.

Type	Description	Pattern	Action
<i>IP/Netmask and IPv6/Netmask</i>	<p>The FortiGate compares the IP address of the client delivering the email to the addresses in the IP address block/allow list specified in the email filter profile.</p> <p>If a match is found, the FortiGate takes the action configured for the matching block/allow list entry against all delivered email.</p> <p>By default the <code>hdrrip</code> setting under <code>config smtp</code> is disabled. If enabled, the FortiGate checks all the IP addresses in the header of SMTP email against the specified IP address block/allow list.</p>	The filter is an IP address with a subnet mask.	<ul style="list-style-type: none"> • <i>Mark as Reject:</i> the email is dropped before reaching its destination. • <i>Mark as Spam:</i> the email is allowed through, but it will be tagged with an indicator marking the email as spam. • <i>Mark as Clear:</i> the email is allowed to go through to its destination on the assumption that it is not spam.

Type	Description	Pattern	Action
<i>Recipient Address</i>	The FortiGate compares the sender email address to the contents of the RCPT TO envelope header and To: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.	<ul style="list-style-type: none"> • Wildcard: the filter is an email address with a wildcard symbol in place of the variable characters (such as <code>*.example.com</code> or <code>fred@*.com</code>). • Regular Expression: the filter is a regular expression. For example, <code>^[a-z0-9-]+(\.[a-z0-9-]+)*@(example xmp examp).com org net</code> can be used to filter based on a number of email domain name combinations. 	<ul style="list-style-type: none"> • Mark as Spam: the email is allowed through, but it will be tagged with an indicator marking the email as spam. • Mark as Clear: the email is allowed to go through to its destination on the assumption that it is not spam.
<i>Sender Address</i>	The FortiGate compares the sender email address to the contents of the MAIL FROM envelope header, From: mail header, and Sender: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		
<i>Subject</i>	The FortiGate compares the sender email address to the contents of the Subject: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		

Banned words

When banned word checking is enabled, the FortiGate examines emails for words that appear in the banned word list specified in the email filter profile.

The banned word pattern can be either wildcard or Perl regular expression, which could include part of a word, a whole word, a phrase, multiple words, or multiple phrases.

Each time the banned word filter detects a pattern in an email, it adds the pattern score to the sum of scores for the message. The score is set when creating a new pattern to block content (`set score`). Higher scores indicate more offensive content. If the total score of the discovered banned words in the email exceeds the threshold value set in the email filter profile, then the FortiGate treats the email as spam. The score for each pattern is counted only once, even if that pattern appears many times in the email. The default score for banned word patterns is 10, and the default threshold in the email filter is 10. This means that by default, an email message is blocked by a single match.

For example, if the FortiGate scans an email containing only this sentence: "The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message." and the banned word list contains the following patterns:

Banned word pattern	Pattern type	Assigned score	Score added to sum for entire page	Comments
word	Wildcard	20	20	The pattern appears twice, but it is counted once.
word phrase	Wildcard	20	0	Both words appear in the email, but they do not appear together as specified in the pattern. There are no matches.
word*phrase	Wildcard	20	20	A match occurs as long as “word” appears before “phrase” regardless of what is in between them. The pattern appears twice, but it is counted once.
mail*age	Wildcard	20	20	This pattern is a match because “email message” appears in the email.

The email would be treated as spam if the banned word threshold is set to 60 or less.

To apply a banned word filter to an email filter profile:

1. Configure the banned words list:

```
config emailfilter bword
  edit 1
    set name "banned"
    config entries
      edit 23
        set pattern-type {wildcard | regexp}
        set pattern <string>
        set score <1 - 99999>
      next
    end
  next
end
```

2. Configure the email filter profile:

```
config emailfilter profile
  edit "myBannedWordsProfile"
    set spam-filtering enable
    set options bannedword
    set spam-bword-threshold <0 - 2147483647>
    set spam-bword-table 23
  next
end
```

Once a banned word list is configured in the CLI and applied to an email filter profile, some settings can be edited in the GUI for that particular email filter profile. A banned word profile can be selected, and its *Threshold* (spam-bword-threshold) can be edited.

Trusted IP addresses

When the FortiGate creates a list of trusted IP addresses, any incoming email traffic from these IP address is exempt from having IP-based checks, such as DNSBL, RBL, FortiGuard Antispam service, or locally-defined IP block lists.

If the FortiGate sits behind a company's mail transfer units, it may be unnecessary to check email IP addresses because they are internal and trusted. In this case, only external IP addresses would be checked. In some cases, external IP addresses may be added to the list if they are known to not be spam sources.

To configure a trusted IP address list:

1. Define the IP address list:

```
config emailfilter iptrust
  edit 1
    set name "trustedIP"
    config entries
      edit 33
        set addr-type {ipv4 | ipv6}
        set ipv4-subnet <IPv4_classnet>
        set ipv6-subnet <IPv6_network>
      next
    end
  next
end
```

2. Add the list to the email filter profile:

```
config emailfilter profile
  edit "email_filter_profile"
    set spam-iptrust-table 1
  next
end
```

MIME header

This feature filters by the MIME header.

To configure a MIME header check:

1. Define the header content:

```
config emailfilter mheader
  edit 100
    set name "mheader"
    config entries
      edit 1
        set fieldname <string>
        set fieldbody <string>
        set pattern-type {wildcard | regexp}
        set action {spam | clear}
      next
    end
  next
end
```

2. Add the header to the email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set options spamhdrcheck
        set spam-mheader-table 100
    next
end
```

Configuring a local-based email filter

To configure a local-based email filter in the GUI:

1. Configure the email filter profile:
 - a. Go to *Security Profiles > Email Filter* and click *Create New*, or edit an existing profile.
 - b. Select a *Feature set* (*Proxy-based* is used in this example) and enable *Enable spam detection and filtering*.
 - c. In the *Local Spam Filtering* section, enable the desired filters (*HELO DNS Lookup*, *Return Email DNS Check*, *Block/Allow List*).
 - d. In the *Block/Allow List* table, click *Create New*. The *Create Anti-Spam Block/Allow List Entry* pane opens.
 - e. Set the *Type* to *IP/Netmask* and enter an *IP/Netmask*.
 - f. Select an *Action*.

The screenshot shows the 'Create Anti-Spam Block/Allow List Entry' dialog box. The 'Type' dropdown is set to 'IP/Netmask'. The 'IP/Netmask' text field contains '10.1.100.0 255.255.255.0'. The 'Action' field has three buttons: 'Mark as Reject', 'Mark as Spam' (which is highlighted in green), and 'Mark as Clear'. The 'Status' is set to 'On' (indicated by a green toggle). The 'OK' button is highlighted in green.

- g. Click **OK** to save the block/allow list.

 Consolidated Policy Configuration

OK **Cancel**

- Set *SSL Inspection* to a profile that has deep SSL inspection enabled. Deep inspection is required to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.
- Configure the other settings as needed.
- Click **OK**.

To configure a local-based email filter in the CLI:**1. Configure a block/allow list:**

```

config emailfilter block-allow-list
  edit 1
    set name "myBAL"
    config entries
      edit 1
        set status enable
        set type ip
        set action spam
        set addr-type ipv4
        set ip4-subnet 10.1.100.0 255.255.255.0
      next
    end
  next
end

```

2. Configure an email filter profile:

```

config emailfilter profile
  edit "myLocalEmailFilter"
    set spam-filtering enable
    set options spambal spamhelodns spamraddrdns
    config smtp
      set action tag
    end
    set spam-bal-table 1
  next
end

```

3. Use the profile in a firewall policy:

```

config firewall policy
  edit 1
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set emailfilter-profile "myLocalEmailFilter"
  next
end

```

FortiGuard-based filters

The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others. For more information, refer to the [FortiGuard](#) website.

There are five FortiGuard spam filtering options:

- [IP address check](#)
- [URL check](#)
- [Detect phishing URLs in email](#) (requires URL check to be enabled)
- [Email checksum check](#)
- [Spam submission](#)

FortiGuard-based filters are not supported while in flow-based inspection mode. See [Inspection mode feature comparison on page 1428](#).

IP address check

The FortiGate queries the FortiGuard Antispam service to determine if the IP address of the client delivering the email is in the block list. If there is a match, the FortiGate treats delivered emails as spam.

URL check

The FortiGate submits all URLs that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL block list, the FortiGate treats the email as spam.

Detect phishing URLs in email

The FortiGate submits all URL hyperlinks that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, the FortiGate removes the hyperlink from the message. The URL remains in place, but it is no longer a clickable hyperlink.

Email checksum check

The FortiGate submits a checksum of each email to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum block list, the FortiGate treats the email as spam.

Spam submission

Spam submission is a way to inform the FortiGuard Antispam service of non-spam messages incorrectly marked as spam. When enabled, the FortiGate adds a link to the end of every email marked as spam. Click the link to notify the FortiGuard Antispam service if an email is marked incorrectly.

Configuring FortiGuard filters

To configure FortiGuard filters in the GUI:

1. Go to *Security Profiles > Email Filter* and click *Create New*.
2. Enable *Enable spam detection and filtering*.
3. In the *FortiGuard Spam Filtering* section, enable the following as needed:
 - *IP Address Check*
 - *URL Check*
 - *Detect Phishing URLs in Email*
 - *Email Checksum Check*
 - *Spam Submission*

4. Click **OK**.

To configure FortiGuard filters in the CLI:

```
config emailfilter profile
  edit <name>
    set spam-filtering enable
    set options spamfsip spamfsurl spamfsphish spamfschksum spamfssubmit
  next
end
```

Option	Description
spamfsip	Check email IP addresses
spamfsurl	Check email content URLs
spamfsphish	Check email content phishing URLs
spamfschksum	Check email checksums
spamfssubmit	Add FortiGuard Antispam spam submission text

Third-party-based filters

In addition to local and FortiGuard filters, FortiOS can leverage third-party sources, which are known as DNS-based blackhole lists (DNSBL) or Open Relay Behavior-modification Systems (ORBS). These are maintained lists of IP addresses that have been identified as associated with spamming.

The following example demonstrates how to configure a DNSBL. The `config emailfilter dnsbl` command is used to configure either DNSBL or ORBS.

To configure a DNSBL:

1. Define the server to get the DNSBL list from:

```
config emailfilter dnsbl
  edit 100
    set name "dnsbl"
    config entries
      edit 1
        set status enable
        set server <IP address or server name>
        set action {reject | spam}
      next
    end
  next
end
```

2. Add the DNSBL list to an email filter profile:

```
config emailfilter profile
  edit "email_filter_profile"
    set options spamrbl
    set spam-rbl-table 100
  next
end
```

Filtering order

The FortiGate checks for spam using various filtering techniques. The filtering order used by the FortiGate depends on which mail protocol is used.

Filters requiring a query to a server and a reply (FortiGuard Antispam service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is *Mark as Spam*, the FortiGate tags the email as spam according to the settings in the email filter profile. If the action in the filter is *Mark as Reject*, the email session is dropped. If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. For SMTP and SMTPS, if the action is *Discard*, the email is discarded or dropped.

SMTP and SMTPS spam filtering order

The FortiGate scans SMTP and SMTPS email for spam in a specific order, which depends on whether or not the local override feature is enabled. This feature is disabled by default, but enabling it gives priority to local spam filters.

You can enable local override (`set local-override`) in an email filter profile to override SMTP or SMTPS remote checks, which includes checks for IP RBL, IP FortiGuard AntiSpam, and HELO DNS with the locally defined antispam block and/or allow lists.

SMTPS spam filtering is available on FortiGates that support SSL content scanning and inspection.

To configure local override of an antispam filter:

```

config emailfilter profile
  edit <name>
    set spam-filtering enable
    set options spambal spamfsip spamfsurl spamhelodns spamfsphish
    config smtp
      set local-override {enable | disable}
    end
    set spam-bal-table 1
  next
end

```

Local override disabled	Local override enabled
<ol style="list-style-type: none"> 1. HELO DNS lookup, last hop IP check against ORDBL 2. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection 3. Last hop IP checks local block/allow list 4. Envelope address checks local block/allow list 5. Headers IPs local block/allow list 6. Headers email address local block/allow list, MIME header checks based on local list of patterns (<i>mheader</i>) 7. Banned words (subject first, then body) based on local block/allow list (<i>bword</i>) 	<ol style="list-style-type: none"> 1. Last hop IP checks local block/allow list 2. Envelope address checks local block/allow list 3. Headers IPs local block/allow list, MIME header checks based on local list of patterns (<i>mheader</i>) 4. Headers email address local block/allow list 5. Banned words (subject first, then body) based on local list of patterns (<i>bword</i>) 6. HELO DNS lookup, last hop IP check against ORDBL 7. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection

IMAP, IMAPS, POP3, and POP3S spam filtering order

The FortiGate scans IMAP, IMAPS, POP3, and POP3S email for spam in the following order:

1. MIME headers check, email address block/allow list check
2. Banned word check on email subject
3. IP block/allow list check
4. Banned word check on email body
5. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, DNSBL and ORDBL checks

IMAPS and POP3S spam filtering are available on FortiGates that support SSL content scanning and inspection.

Protocols and actions

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

MAPI is only configurable in the CLI and with the proxy feature set.

To configure protocols in an email filter:

```
config emailfilter profile
  edit <name>
    set feature-set {flow | proxy}
    set spam-filtering enable
    set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl
spamhelodns spamraddrdns spamrbl spamhdrcheck spamfsphish}
    config smtp
      set log-all {enable | disable}
      set action {pass | tag | discard}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
      set hdrip {enable | disable}
      set local-override {enable | disable}
    end
    config imap
      set log-all {enable | disable}
      set action {pass | tag}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
    end
    config pop3
      set log-all {enable | disable}
      set action {pass | tag}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
    end
    config mapi
      set log-all {enable | disable}
      set action {pass | discard}
    end
  next
end
```

options ...

The following options are available:

- bannedword: content block.
- spambal: block/allow list.
- spamfsip: email IP address FortiGuard antisipam block list check.
- spamfssubmit: add FortiGuard antisipam spam submission text.
- spamfschksum: email checksum FortiGuard antisipam check.
- spamfsurl: email content URL FortiGuard antisipam check.
- spamhelodns: email HELO/EHLO domain DNS check.
- spamraddrdns: email return address DNS check.
- spamrbl: email DNSBL and ORBL check.
- spamhdrcheck: email MIME header check.
- spamfsphish: email content phishing URL FortiGuard antisipam check.

tag-type {subject header spaminfo}	Set the tag type: <ul style="list-style-type: none"> subject: prepend text to the spam email subject. header: append a user-defined MIME header to the spam email. spaminfo: append spam information to the spam email header.
tag-msg <string>	Subject text or header added to the spam email.
hdrrip {enable disable}	Enable/disable SMTP email header IP checks for spamfsip, spamrbl, and spambal filters.
local-override {enable disable}	Enable/disable local filter to override SMTP remote check result.

For more information, see [config emailfilter profile](#) in the FortiOS CLI Reference.

Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

To configure webmail filtering:

```
config emailfilter profile
  edit <name>
    set spam-filtering enable
    config msn-hotmail
      set log-all enable
    end
    config gmail
      set log-all enable
    end
  next
end
```

VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- *default*
- *strict*

You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

VoIP profiles cannot be used NGFW policy-based mode. See [NGFW policy on page 1192](#) for more information.

The following topics provide information about VoIP profiles:

- [General use cases on page 1639](#)
- [NAT46 and NAT64 for SIP ALG on page 1643](#)
- [SIP message inspection and filtering on page 1651](#)
- [SIP ALG and SIP session helper on page 1656](#)
- [SIP pinholes on page 1661](#)
- [SIP over TLS on page 1663](#)
- [Voice VLAN auto-assignment on page 1665](#)
- [Scanning MSRP traffic on page 1666](#)

General use cases

There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network that is protected from the internet by a FortiGate.
2. The SIP clients are in a private network that is protected from the internet by a FortiGate.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP's network, that is protected from the internet by a FortiGate. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for these common scenarios.

VIP

A FortiGate with SIP Application Layer Gateway (ALG) or SIP session helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.

A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through port1 and set up SIP calls. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 172.20.120.50
        set extintf "port1"
        set mappedip "10.11.101.50"
    next
end
```

To configure the firewall policy:

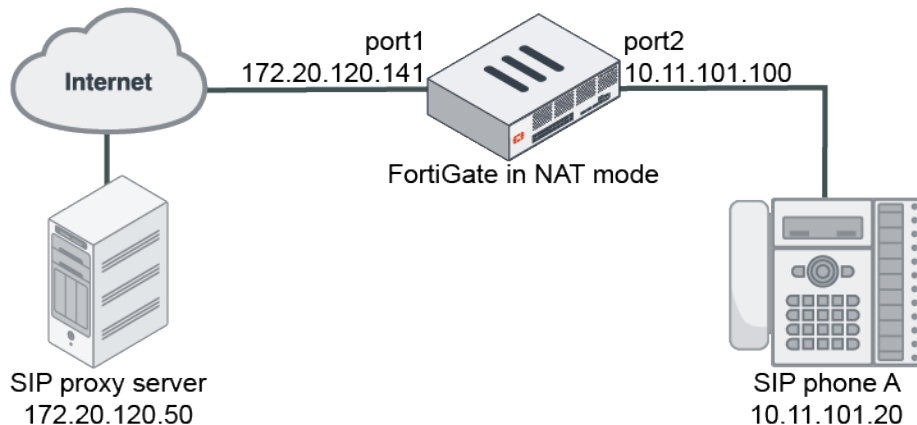

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
    next
end
```

Setting `service` to `SIP` and not `all` in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.

NAT

A FortiGate with SIP ALG or SIP session helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.

One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "SIP"
    set nat enable
  next
end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application. This is only supported in proxy mode.

In this example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.

The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the SIP applications. This causes problems in a SIP session initiated process. Special configurations for the hosted NAT traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

```
config system interface
  edit "port1"
    set external enable
  next
end
```

2. Configure the VIP for the SIP server:

```
config firewall vip
  edit "VIP_for_SIP_Server"
    set extip 10.21.101.10
```

```

        set extintf "port1"
        set mappedip "10.30.120.20"
    next
end

```

3. Configure a VoIP profile with HNT enabled:

```

config voip profile
    edit "hnt"
        config sip
            set hosted-nat-traversal enable
            set hnt-restrict-source-ip enable
        end
    next
end

```

`hosted-nat-traversal` must be enabled. `hnt-restrict-source-ip` does not have to be enabled, but can be enabled to restrict the RTP packets' source IP to be the same as the SIP packets' source IP.

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```

config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "hnt"
        set nat enable
    next
end

```

`nat` must be enabled in the firewall policy.

NAT46 and NAT64 for SIP ALG

NAT46 and NAT64 are supported for SIP ALG. A mix of IPv4 and IPv6 networks can use SIP ALG, allowing for proper call handling.

NAT46 example

In this example, SIP phones on the internal network use IPv4, and the SIP server on an external network uses IPv6. NAT46 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.

To configure the FortiGate:

1. Configure a firewall VIP with NAT46 enabled:

```

config firewall vip
  edit "vip46_server_asterisk"
    set extip 10.1.100.100
    set nat44 disable
    set nat46 enable
    set extintf "port1"
    set ipv6-mappedip 2000:172:16:200::44
  next
end

```

2. Configure an IPv6 pool:

```

config firewall ippool6
  edit "client_server_nat46"
    set startip 2000:172:16:200::200
    set endip 2000:172:16:200::207
    set nat46 enable
  next
end

```

3. Configure a firewall policy:

```

config firewall policy
  edit 1
    set name "policy46-1"
    set srcintf "port1"
    set dstintf "port9"
    set action accept
    set nat46 enable
    set srcaddr "all"
    set dstaddr "vip46_server_asterisk"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set voip-profile "sip"
    set logtraffic all
    set auto-asic-offload disable
    set ippool enable
  next
end

```

```

        set poolname6 "client_server_nat46"
    next
end

```

To check the SIP calls and session lists when the phones are registering to the SIP server:

1. View the SIP proxy SIP calls:

```

# diagnose sys sip-proxy calls
sip calls
vdom 3 (vdom1) vrf 0 call 7f64bf044b00
  call-id: 1513782757

epoch=0 event_id=9 srcip=10.1.100.11 src_port=5060 dstip=2000:172:16:200::44 dst_port=5060
proto=17 src_int="port1" dst_int="port9" policy_id=1 profile="sip" voip_proto="sip"
kind="register" action="permit" status="authentication-required" duration=0 dir="session_
origin" call_id="1868762230" from="sip:2001@10.1.100.100" to="sip:2001@10.1.100.100"
```

When one phone is calling another phone:

```
date=2022-02-17 time=16:44:53 eventtime=1645145093351288241 tz="-0800" logid="0814044032"
type="utm" subtype="voip" eventtype="voip" level="information" vd="vdom1" session_id=924
epoch=0 event_id=11 srcip=10.1.100.11 src_port=5060 dstip=2000:172:16:200::44 dst_port=5060
proto=17 src_int="port1" dst_int="port9" policy_id=1 profile="sip" voip_proto="sip"
kind="call" action="permit" status="start" duration=0 dir="session_origin" call_
id="133636365" from="sip:2001@10.1.100.100" to="sip:2002@10.1.100.100"
```

NAT64 example

In this example, SIP phones on the internal network use IPv6, and the SIP server on an external network uses IPv4. NAT64 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.

To configure the FortiGate:

1. Configure a firewall VIP with NAT64 enabled:

```

config firewall vip
  edit "vip64-1-asterisk"
    set extip 2000:10:1:100::100
    set nat66 disable
    set nat64 enable
    set ipv4-mappedip 172.16.200.44
  next
end

```

2. Configure an IP pool:

```

config firewall ippool
  edit "client_server_nat46"
    set startip 172.16.200.2
    set endip 172.16.200.3
    set nat64 enable
  next
end

```

3. Configure a firewall policy:

```

config firewall policy
  edit 1
    set name "policy64-1"
    set srcintf "port1"
    set dstintf "port9"
    set action accept
    set nat64 enable
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "vip64-1-asterisk"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
  
```

```

        set voip-profile "sip"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "client_server_nat64"
    next
end

```

SIP message inspection and filtering

There are two types of VoIP profiles that can be configured:

```

config voip profile
    edit <name>
        set feature-set {ips | voipd}
    next
end

```

`feature-set {ips | voipd}` Set the inspection feature set.

- `ips`: use the IPS Engine feature set for the `ips-voip-filter` firewall policy option.
- `voipd`: use the SIP ALG feature set for `voip-profile` firewall policy option.

SIP ALG provides users with security features to inspect and control SIP messages that are transported through the FortiGate, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

Proxy-based SIP ALG (`feature-set voipd`) is also able to handle features such as pin hole creation and NAT that flow-based SIP inspection cannot. Flow-based SIP (`feature-set ips`) can handle features such as MSRP decoding and scanning that proxy-based SIP ALG cannot.

The two VoIP profile types can be configured separately or at the same time on a firewall policy:

```

config firewall policy
    edit 1
        set voip-profile "voip_sip_alg"
        set ips-voip-filter "voip_sip_ips"
    next
end

```

Where:

- `voip-profile` can select a voip-profile with `feature-set voipd`.
- `ips-voip-filter` can select a voip-profile with `feature-set ips`.

The IPS-based VoIP profile (`ips-voip-filter`) allows flow-based SIP to complement SIP ALG while working together.

When both SIP ALG and SIP IPS are used and configured with same block rules, SIP IPS will take priority and do the blocking.

Unlike previous versions (7.0 and 7.2.0-7.2.4) where the firewall policy's inspection mode determines whether the SIP traffic is scanned by SIP ALG or flow-based SIP, the inspection mode does not matter in this version. A `voipd`-based VoIP profile will activate SIP ALG inspection, while an `ips`-based VoIP profile will activate IPS-based SIP inspection.

A `voip`-profile can be selected regardless of the `inspection-mode` used in the firewall policy.

For more information about the difference between SIP ALG and the SIP session helper, see [SIP ALG and SIP session helper on page 1656](#).

Example

In this example, SIP ALG is required for pinhole creation, handling NAT, and controlling SIP messages that requires flow-based SIP. The administrator needs to configure two SIP profiles, one with each feature set (`voipd` and `ips`), and apply these SIP profiles in the same firewall policy.

To configure SIP ALG with SIP IPS:

1. Configure the VoIP profiles:

```

config voip profile
  edit "voip_sip_alg"
    set feature-set voipd
    set comment "sip_alg_simple"
    config sip
      set log-violations enable
      set log-call-summary enable
    end
  next
  edit "voip_sip_ips"
    set feature-set ips
    set comment "ips_voip_blocking"
    config sip
      set block-invite enable
      set log-violations enable
    end
  next
end

```

2. Configure the firewall policy:

```

config firewall policy
  edit 1
    set srcintf "port1"
    set dstintf "port9"
    set action accept
  
```

```
set srcaddr "all"
set dstaddr "all"
set srcaddr6 "all"
set dstaddr6 "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set ips-sensor "g-default"
set voip-profile "voip_sip_alg"
set ips-voip-filter "voip_sip_ips"
set logtraffic all
set nat enable
next
end
```

To verify the SIP proxy SIP calls:

1. Verify the register request:

```
# diagnose sys sip-proxy calls
sip calls
vdom 1 (vdom1) vrf 0 call 7f2b99828300
call-id: 619216389
txn 7f2b998ad600 (REGISTER)
cseq 2 dir 0 state 5 status 200 expiry 527 HA 0
i_session: 7f2b998aac00 r_session: 7f2b998aac00
register: present
from: sip:2001@172.16.200.44
to: sip:2001@172.16.200.44
src: 10.1.100.11:5060
dst: 172.16.200.44:5060
```

2. Verify the invite request:

```
# diagnose sys sip-proxy calls
sip calls
vdom 1 (vdom1) vrf 0 call 7f2b99828300
call-id: 619216389
txn 7f2b998ad600 (REGISTER)
cseq 2 dir 0 state 5 status 200 expiry 316 HA 0
i_session: 7f2b998aac00 r_session: 7f2b998aac00
register: present
from: sip:2001@172.16.200.44
to: sip:2001@172.16.200.44
src: 10.1.100.11:5060
dst: 172.16.200.44:5060
```

Sample logs

Register request:

```
date=2023-01-13 time=09:46:03 eventtime=1673631963477298677 tz="-0800" logid="0814044032"
type="utm" subtype="voip" eventtype="voip" level="information" vd="vdom1" session_id=17092
epoch=0 event_id=1 srcip=10.1.100.11 src_port=5060 dstip=172.16.200.44 dst_port=5060
proto=17 src_int="port1" dst_int="port9" policy_id=1 profile="voip_sip_alg" voip_proto="sip"
```

```
kind="register" action="permit" status="succeeded" duration=0 dir="session_origin" call_id="619216389" from="sip:2001@172.16.200.44" to="sip:2001@172.16.200.44"
```

Invite request:

```
date=2023-01-13 time=09:54:43 eventtime=1673632484065549240 tz="-0800" logid="0814044033"
type="utm" subtype="voip" eventtype="voip" level="notice" vd="vdom1" session_id=17092
epoch=0 event_id=0 srcip=10.1.100.11 src_port=5060 dstip=172.16.200.44 dst_port=5060
proto=17 src_int="port1" dst_int="port9" policy_id=1 profile="voip_sip_ips" voip_proto="sip"
kind="call" action="block" status="N/A" reason="block-request" duration=0 dir="session_reverse" message_type="request" request_name="INVITE" call_id="1967779864" count=0
from="<sip:2001@172.16.200.44>" to="<sip:2002@172.16.200.44>" attackid=50083
attack="SIP.Invite.Method"
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.

```
malformed-request-line
malformed-header-via
malformed-header-from
malformed-header-to
malformed-header-call-id
malformed-header-cseq
malformed-header-rack
malformed-header-rseq
malformed-header-contact
malformed-header-record-route
malformed-header-route
malformed-header-expires
malformed-header-content-type
malformed-header-content-length
malformed-header-max-forwards
malformed-header-allow
malformed-header-p-asserted-identity
malformed-header-sdp-v
malformed-header-sdp-o
malformed-header-sdp-s
malformed-header-sdp-i
malformed-header-sdp-c
malformed-header-sdp-b
malformed-header-sdp-z
malformed-header-sdp-k
malformed-header-sdp-a
malformed-header-sdp-t
malformed-header-sdp-r
malformed-header-sdp-m
malformed-header-no-require*
malformed-header-no-proxy-require*
```

* = only available in flow mode

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

```
block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**
```

** = only available in proxy mode

SIP message rate limiting

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

```
register-rate
invite-rate
subscribe-rate
message-rate
notify-rate
refer-rate
update-rate
options-rate
ack-rate
prack-rate
info-rate
publish-rate
bye-rate
cancel-rate
```

Additionally, flow-based SIP supports the following rate tracking features:

```
register-rate-track none
invite-rate-track none
subscribe-rate-track none
message-rate-track none
notify-rate-track none
refer-rate-track none
update-rate-track none
options-rate-track none
ack-rate-track none
prack-rate-track none
info-rate-track none
```

```
publish-rate-track none
bye-rate-track none
cancel-rate-track none
```

Call-Id and Content-Type regex

When the `ips` VoIP profile feature set is selected, options for Call-Id and Content-Type header values can be configured.

```
config voip profile
  edit <name>
    config sip
      set call-id-regex <string>
      set call-id-regex <string>
    end
  next
end
```

<code>call-id-regex <string></code>	Enter a validation PCRE regular expression for the Call-Id header value.
<code>call-id-regex <string></code>	Enter a validation PCRE regular expression for the Content-Type header value.

SIP ALG and SIP session helper

The SIP session helper is a high-performance solution that provides basic support for SIP calls passing through the FortiGate by opening SIP and RTP pinholes, and by performing NAT of the addresses in SIP messages.

SIP Application Layer Gateway (ALG) provides the same basic SIP support as the SIP session helper. In addition, SIP ALG provides a wide range of features that protect your network from SIP attacks, apply rate limiting to SIP sessions, check the syntax of SIP and SDP content of SIP messages, and provide detailed logging and reporting of SIP activity.

By default, all SIP traffic is processed by the SIP ALG. If the policy that accepts the SIP traffic includes a VoIP profile, the SIP traffic is processed by that profile. If the policy does not include a VoIP profile, the SIP traffic is processed by the SIP ALG using the default VoIP profile.

To change between SIP ALG mode and SIP session helper mode:

```
config system settings
  set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

<code>default-voip-alg-mode {proxy-based kernel-helper-based}</code>	Set how the FortiGate handles VoIP traffic when a policy that accepts the traffic does not include a VoIP profile. <ul style="list-style-type: none"> <code>proxy-based</code>: use SIP ALG to process SIP traffic (default). <code>kernel-helper-based</code>: use the SIP session helper to process SIP traffic.
--	--

The `default-voip-alg-mode` setting works together with the VoIP profile configured in a firewall policy to determine whether SIP ALG, SIP ALG with IPS SIP, or the SIP session helper are used to process the SIP traffic. The following firewall policy settings correspond to the VoIP profiles (see also [SIP message inspection and filtering on page 1651](#)).

```
config firewall policy
  edit <id>
```

```

        set voip-profile <voipd-based_profile>
        set ips-voip-filter <ips-based_profile>
    next
end

```

The following table explains the results of configuring different combinations of the preceding settings.

Firewall policy setting		Default VoIP ALG mode setting	
voip-profile	ips-voip-filter	kernel-helper-based	proxy-based
Yes	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
Yes	No	SIP ALG	SIP ALG
No	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
No	No	SIP session helper	SIP ALG

SIP ALG configurations

SIP ALG can be enabled in several ways. The following configuration examples demonstrate different settings.

Example 1

In this example, a `voipd`-based profile is configured and applied to a firewall policy. The `default-voip-alg-mode` remains as the default setting (`proxy-based`).

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```

config system settings
    set default-voip-alg-mode proxy-based
end

```

2. Configure the VoIP profile:

```

config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end

```

3. Configure the firewall policy:

```

config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end

```

Example 2

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`. A VoIP profile (VoIP-Proxy) has SIP enabled and is applied to a firewall policy.

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 3

In this example, no VoIP profile is selected in the firewall policy. However, the `default-voip-alg-mode` is set to `proxy-based`. The default `voip-profile` is implicitly applied.

To configure SIP ALG to implicitly use the default VoIP profile:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile ""
    next
end
```

SIP session helper configurations

In some instances, SIP providers may recommend that customers disable SIP ALG on their edge firewall. This is how you can disable SIP ALG and enable the SIP session helper.

Example 1

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`, and a VoIP profile is not applied in a firewall policy. Session helper 13 is enabled by default.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to either `proxy-based` or `kernel-helper-based`. A VoIP profile that has SIP disabled is applied to the firewall policy.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-disabled-profile"
        set feature-set voipd
```

```
        config sip
            set status disable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile "sip-disabled-profile"
    next
end
```

4. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 3

In this example, the session helper is removed because the SIP provider suggests to disable SIP ALG and the session helper altogether.

To remove the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Remove the session helper:

```
config system session-helper
    delete 13
end
```

Modifying the SIP port

Most SIP configurations use TCP or UDP port 5060 for SIP sessions and port 5061 for SIP SSL sessions. If your SIP network uses different ports for SIP sessions, the SIP port can be changed. You can also listen to two TCP and UDP ports .

To change the SIP port:

```
config system settings
    set sip-tcp-port 5064
    set sip-udp-port 5065
    set sip-ssl-port 5066
end
```

To listen to two TCP and UDP ports:

```
config system settings
    set sip-tcp-port 5060 5064
    set sip-udp-port 5061 5065
end
```

To modify the SIP ports for the default SIP session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5065
    next
end
```

To add a new session helper to listen on UDP and TCP 5064:

```
config system session-helper
    edit 0
        set name sip
        set port 5064
    next
end
```

SIP pinholes

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

SIP pinhole restriction

The `strict-register` attribute is enabled by default. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiGate, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiGate to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.

SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

To configure registrar connection ability:

```
config voip profile
  edit <name>
    config sip
      set strict-register {enable | disable}
    end
  next
end
```

RTP/RTCP pinhole restriction

The `nat-port-range` setting is used to specify a port range in the VoIP profile to restrict the NAT port range for Real-time Transport Protocol/Real-time Transport Control Protocol (RTP/RTCP) packets in a Session Initiation Protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

To edit the translated port range for RTP/RTCP packets:

```
config voip profile
  edit <name>
    config sip
      set nat-port-range <start_port_number>-<end_port_number>
    end
  next
end
```

```
nat-port-range <start_
  port_number>-<end_
  port_number>
```

Enter the NAT port range (minimum port number = 5117, default = 5117-65535).

Example

In this example, Phone 1 is in Subnet 1, and the SIP server and Phone 2 are in Subnet 2. All SIP signaling messages and RTP/RTCP packets go through the SIP server. The RTP/RTCP ports on Phone 1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. If Phone 1 and Phone 2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of Phone 1 will be translated to ports 30000/30001. All RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001.

To configure the custom port range:

1. Edit the VoIP profile:

```

config voip profile
  edit "natPortRange"
    config sip
      set nat-port-range 30000-30001
    end
  next
end
  
```

It is best practice to configure the starting port as an even number and the ending port as an odd number.

2. Configure the firewall policy:

```

config firewall policy
  edit 1
    set srcintf port1
    set dstintf port2
    set srcaddr all
    set dstaddr all
    set service SIP
    set action accept
    set schedule always
    set voip-profile natPortRange
    set nat enable
  next
end
  
```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate

SIP ALG intercepts, unencrypts, and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.2.

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to `full`. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```
config voip profile
  edit "tls"
    config sip
      set ssl-mode full
      set ssl-client-certificate "ssl_client_cert"
      set ssl-server-certificate "ssl_server_cert"
    end
  next
end
```

The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSSL, and imported to the local certificate store of the FortiGate from *System > Certificates* in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, so that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port1"
    set dstintf "port2"
    set srcaddr "all"
    set dstaddr "vip_sip_server"
    set action accept
    set schedule "always"
    set service "SIP"
    set utm-status enable
    set voip-profile "tls"
  next
end
```

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in FortiOS include LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configure VLAN auto-assignment using the following steps:

1. [Set up the VLAN for the voice device](#)
2. [Set up the DHCP server for the voice VLAN](#)
3. [Set up the LLDP network policy](#)
4. [Enable LLDP on the physical interface that the VLAN belongs to](#)
5. [Apply the LLDP network policy on the physical interface](#)
6. [Confirm that the VLAN was assigned](#)

To set up the VLAN for the voice device:

```
config system interface
  edit "vlan_100"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
    set alias "voice_vlan"
    set device-identification enable
    set role lan
    set snmp-index 25
    set interface "port10"
    set vlanid 100
  next
end
```

To set up the DHCP server for the voice VLAN:

```
config system dhcp server
  edit 1
    set dns-service default
    set default-gateway 192.168.1.99
    set netmask 255.255.255.0
    set interface "vlan_100"
    config ip-range
      edit 1
        set start-ip 192.168.1.110
        set end-ip 192.168.1.210
      next
    end
  next
end
```

To set up the LLDP network policy:

```
config system lldp network-policy
  edit "1"
    config voice
      set status enable
```

```
        set tag dot1q
        set vlan 100
    end
next
end
```

To enable LLDP on the physical interface that the VLAN belongs to:

```
config system interface
    edit "port10"
        set vdom "root"
        set type physical
        set lldp-reception enable
        set lldp-transmission enable
        set snmp-index 14
    next
end
```

To apply the LLDP network policy on the physical interface:

```
config system interface
    edit "port10"
        set lldp-network-policy "1"
    next
end
```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
In this example, the voice traffic from the IP phone should be in VLAN 100.

Scanning MSRP traffic

An MSRP (Message Session Relay Protocol) decoder in the IPS engine scans for IPS signatures against the application data. Malicious payload in the text message can be blocked. A VoIP profile using flow inspection mode must be configured in the firewall policy. An IPS profile must be configured in the firewall policy to inspect the payload.

```
config voip profile
    edit <name>
        set feature-set flow
        config msrp
            set status {enable | disable}
            set log-violations {enable | disable}
            set max-msg-size <integer>
            set max-msg-size-action {pass | block | reset | monitor}
        end
    next
end
```

<code>status {enable disable}</code>	Enable/disable MSRP.
<code>log-violations {enable disable}</code>	Enable/disable logging of MSRP violations.
<code>max-msg-size <integer></code>	Maximum allowable MSRP message size, in bytes (0 - 65535, default = 0).
<code>max-msg-size-action {pass block reset monitor}</code>	Action for violating maximum MSRP message size: <ul style="list-style-type: none"> • pass: pass or allow matching traffic (default) • block: block or drop matching traffic • reset: reset sessions for matching traffic • monitor: pass and log matching traffic

Examples

In this first example, MSRP messages larger than 10 bytes will be blocked. The client sends an oversized MSRP message to the server. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with plain text placed in the message field. The software uses the content of the `MsrpInputMessage.txt` file located in the default folder, where anything in that file will be sent by MSRP. The following text is used:

GL's Message Automation & Protocol Simulation (MAPS™) is a protocol simulation and conformance test tool that supports a variety of protocols such as SIP, MEGACO, MGCP, SS7, ISDN, GSM, MAP, CAS, LTE, UMTS, SS7 SIGTRAN, ISDN SIGTRAN, SIP I, GSM AoIP, Diameter and others. This message automation tool covers solutions for both protocol simulation and protocol analysis. The application includes various test plans and test cases to support the testing of real-time entities. Along with automation capability, the application gives users the unlimited ability to edit messages and control scenarios (message sequences).

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```

config voip profile
  edit msrp_test
    set feature-set flow
    config msrp
      set status enable
      set log-violations enable
      set max-msg-size 10
      set max-msg-size-action block
    end
  next
end
  
```

2. Configure the firewall policy:

```

config firewall policy
  edit 1
    set name "vdom3"
    set srcintf "vlan843"
    set dstintf "vlan844"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set voip-profile "msrp_test"
    set logtraffic all
  next
end

```

3. Verify the log:

```

# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

```

```

1: date=2021-06-10 time=17:21:19 eventtime=1623370879840284165 tz="-0700"
logid="0419016384" type="utm" subtype="ips" eventtype="signature" level="alert"
vd="vdom3" severity="info" srcip=192.168.12.212 srccountry="Reserved"
dstip=192.168.12.213 srcintf="vlan843" srcintfrole="lan" dstintf="vlan844"
dstintfrole="lan" sessionid=27700 action="dropped" proto=6 service="MSRP" policyid=1
attack="MSRP.Max.Message.Size.Exceeded" srcport=20036 dstport=20036 direction="outgoing"
attackid=1000000 profile="g-default" ref="http://www.fortinet.com/ids/VID1000000"
incidentserialno=189792275 psrport=0 pdstport=0 msg="msrp_decoder:
MSRP.Max.Message.Size.Exceeded, msg_size=270 exceeds config maximum=10"

```

4. In MAPS, verify that the call was terminated:

The screenshot shows the MAPS (Message Automation Protocol Simulation) interface. The top part displays a table with call execution details. Below the table, there is a detailed call flow diagram showing the sequence of events between the MAPS client and the DUT (Device Under Test).

Sr No	Script Name	Profile	Call Info	Script Execution	Status	Events	Events Profile	Result	Total Iterations	Completed Iterations
1	SpRegistrationControl.gls	Profile0001	CGProScriptId:98-693436402-2281-7216	Start		None		Unknown	1	1
2	SpCallControl.gls	Profile0001	GLMAPS-113-693431911-2277-96208132-168-12-212	Start	Call Terminated	None		Pass	1	1

The call flow diagram shows the following sequence of events:

- MAPS sends INVITE to DUT at 11:32:33.127000.
- DUT sends 100 Trying to MAPS at 11:32:33.190000.
- DUT sends 180 Ringing to MAPS at 11:32:33.207000.
- DUT sends 200 OK to MAPS at 11:32:33.340000.
- DUT sends ACK to MAPS at 11:32:33.365000.
- DUT sends BYE to MAPS at 11:32:38.201000.
- DUT sends 200 OK to MAPS at 11:32:38.244000.

In this second example, malicious files will be blocked. The client sends an EICAR test sample to the server in an MSRP message. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to

use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with a plain text EICAR file containing a virus in the message field. The following text is used:

```
X5O!P%@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*
```

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
  edit msrp_test
    set feature-set flow
    config msrp
      set status enable
      set log-violations enable
      set max-msg-size 0
      set max-msg-size-action pass
    end
  next
end
```

2. Configure the IPS profile:

```
config ips sensor
  edit "msrp"
    set extended-log enable
    config entries
      edit 1
        set rule 7470 29844
        set status enable
        set action block
      next
    end
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set name "vdom3"
    set srcintf "vlan843"
    set dstintf "vlan844"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set ips-sensor "msrp"
    set voip-profile "msrp_test"
    set logtraffic all
  next
end
```

4. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-09-16 time=11:29:48 eventtime=1631816988947762597 tz="-0700"

ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see [RFC 3507](#).

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, *ICAP* is not visible in the GUI. See [Feature visibility on page 2702](#) for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See [NGFW policy on page 1192](#) for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- [ICAP configuration example on page 1671](#)
- [ICAP response filtering on page 1673](#)
- [Secure ICAP clients on page 1675](#)
- [ICAP scanning with SCP and FTP on page 1676](#)

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.

For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.

When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To configure the ICAP setup in the GUI:

1. Add the ICAP server:
 - a. Go to *Security Profiles > ICAP Servers* and click *Create New*.
 - b. In the *Name* field, enter a name for the ICAP server, such as *content-filtration-server4*.
 - c. Select the *IP Version*.
 - d. In the *IP Address* field, enter the IP address of the ICAP server.
 - e. In the *Port* field, enter a new port number if required. The default value is *1344*.

- f. Click *OK*.

The maximum number of concurrent connections to ICAP server can be configured in the CLI (`set max-connections`). The default setting is 100 connections.

2. Create the ICAP profile:
 - a. Go to *Security Profiles > ICAP* and click *Create New*.
 - b. In the *Name* field, enter a name for the ICAP profile, such as *Prop-Content-Filtration*.
 - c. Enable *Request Processing* and set the following:
 - *Server*: select the ICAP server (*content-filtration-server4*).
 - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.

- *On Failure*: select *Error* to block the request. If the message cannot be processed, it will not be blocked.
- d. Enable *Response Processing* and set the following:
 - *Server*: select the ICAP server (*content-filtration-server4*).
 - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
 - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will not be blocked.
- e. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.

f. Click **OK**.

3. Add the ICAP profile to a policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- b. Set *Inspection Mode* to *Proxy-based*.
- c. Under *Security Profiles*, enable *ICAP* and select the ICAP server.

- d. Configure the other settings as needed.
- e. Click **OK**.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```
config icap server
  edit "content-filtration-server4"
    set ip-version 4
    set ip-address 172.16.100.55
    set port 1344
    set max-connections 200
  next
end
```

2. Create the ICAP profile:

```

config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-failure error
        set response-failure error
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
    next
end

```

3. Add the ICAP profile to a policy:

```

config firewall policy
    edit 5
        set name "icap_filter3"
        set srcintf "virtual-wan-link"
        set dstintf "virtual-wan-link"
        set srcaddr "FABRIC_DEVICE"
        set dstaddr "FABRIC_DEVICE"
        set dstaddr-negate enable
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic disable
        set fsso disable
        set nat enable
    next
end

```

ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if `response` is enabled, the `respmo-default-action` option can be configured:

- If `respmo-default-action` is set to `forward`, FortiGate will treat every HTTP response and send ICAP requests to the ICAP server.
- If `respmo-default-action` is set to `bypass`, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to `forward`.

When configuring a response rule:

- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.
- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the

rule takes effect.

- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.

Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.

In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in their header.

To configure an ICAP profile with HTTP response rules:

```

config icap profile
  edit "icap_profile2"
    set request disable
    set response enable
    set streaming-content-bypass disable
    set preview disable
    set response-server "icap_server1"
    set response-failure error
    set response-path ''
    set methods delete get head options post put trace other
    set response-req-hdr disable
    set respmod-default-action bypass
  config respmod-forward-rules
    edit "rule2"
      set host "all"
      set action forward
      set http-resp-status-code 200 301 302
      config header-group
        edit 2
          set header-name "content-type"
          set header "image/jpeg"
        next
      next
    next
  next
end

```

```

        end
    next
end
next
end

```

To view the logs if an error occurs:

1. View the traffic log:

```

# execute log filter category 0
# execute log display
1 logs found.
1 logs returned.

1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"

dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6
action="blocked" profile="icap_profile1" url="/icap_test/"

```

The logs show that the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a *502 Bad Gateway* message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as *Result: Deny: UTM Blocked*.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```

config icap server
    edit <name>
        set secure {enable | disable}
        set ssl-cert <certificate>
    next
end

```

To configure a secure ICAP client:**1. Configure the ICAP server:**

```
config icap server
    edit "icap_server1"
        set ip-version 4
        set ip-address 192.168.10.2
        set port 11344
        set max-connections 100
        set secure enable
        set ssl-cert "ACCVRAIZ1"
    next
end
```

Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
    edit "icap_profile1"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "icap_server1"
        set response-server "icap_server1"
    next
end
```

3. Configure the firewall policy:

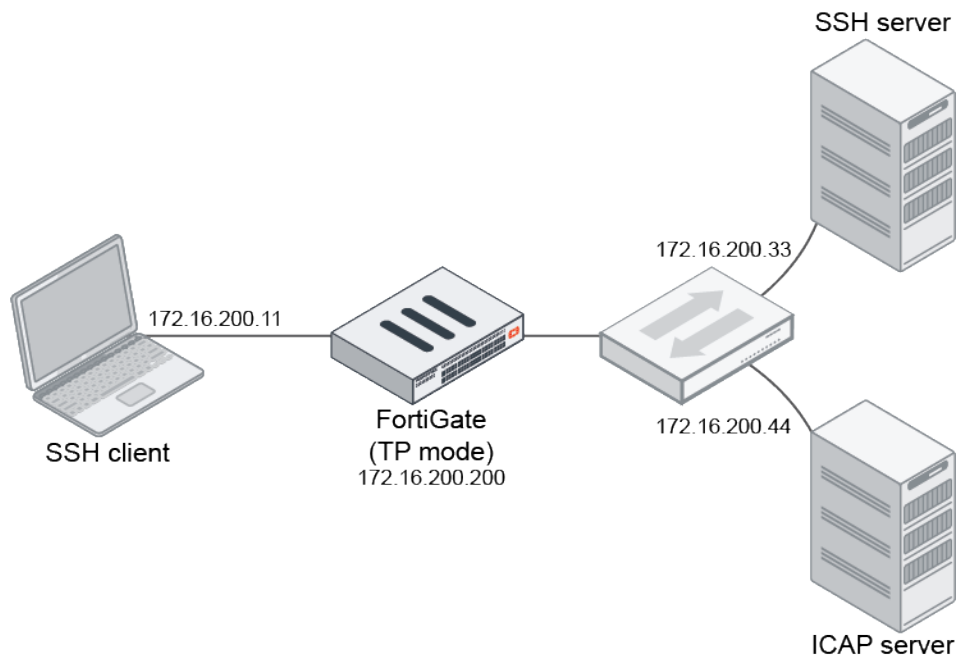

```
config firewall policy
    edit 1
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

ICAP scanning with SCP and FTP

A FortiGate can forward files transferred by SCP and FTP to an ICAP server for further scanning. Previously, only HTTP and HTTPS were supported for ICAP forwarding.

Example

The FortiGate used in this example is operating in transparent mode. The SSH client, 172.16.200.11, sends a file named `today` to the SSH server at 172.16.200.33 using SCP. Since SCP transfers are encrypted inside an SSH tunnel, for the FortiGate to scan the traffic, deep inspection must be enabled in the SSL SSH profile.

To configure ICAP scanning with SCP:

1. Configure the ICAP server settings:

```

config icap server
  edit "icap_server1"
    set ip-address 172.16.200.44
  next
end

```

2. Configure the ICAP profile for SSH:

```

config icap profile
  edit "icap_profile1"
    set file-transfer ssh
    set file-transfer-server "icap_server1"
    set file-transfer-path "ssh_test"
  next
end

```

If the file transfer is over FTP, configure the profile as follows:

```

config icap profile
  edit "icap_profile1"
    set file-transfer ftp
    set streaming-content-bypass enable
    set file-transfer-server "icap_server1"
    set file-transfer-path "ftp_test"
  next
end

```

3. Configure the SSL SSH profile:

```

config firewall ssl-ssh-profile
    edit "protocols"
        config ssh
            set ports 22
            set status deep-inspection
        end
    next
end

```

4. Configure the firewall policy:

```

config firewall policy
    edit 1
        set name "ICAP"
        set srcintf "lan"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end

```

To test the configuration:

1. On a Linux client, copy a file named `today` to the SSH server using SCP:

```
scp today fosqa@172.16.200.33:/home/fosqa/ssh_depot/
```

2. Capture a sniffer trace between the FortiGate and ICAP server, then verify the output from the ICAP protocol session.

- a. The client request and the file to be inspected:

```

ICap_client REQMOD:
172.016.200.200.13185-172.016.200.044.01344: REQMOD icap://172.16.200.44:1344/ssh_
test ICAP/1.0
Host: 172.16.200.44:1344
X-Client-IP: 172.16.200.11
X-Server-IP: 172.16.200.33
X-Authenticated-User: TG9jYWw6Ly9hbm9ueWlvdXM=
X-Authenticated-Groups: TG9jYWw6Ly9sb2Nhbm9ueWlvdXM=
User-Agent: FortiOS v7.2.0
Encapsulated: req-hdr=0, req-body=116

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked

1d
Tue Sep 20 04:01:50 UTC 2022

```

Where:

- X-Client-IP = the client sending the file
- X-Server-IP = the server receiving the file
- Tue Sep 20 04:01:50 UTC 2022 = the content of the file, which is in clear text after the FortiGate performs deep inspection

- b. The ICAP server response that the file is cleared and allowed to pass without modifications:

ICap-server reply:

```
172.016.200.044-172.016.200.200.13185: ICAP/1.0 200 OK
ISTag: "GreasySpoon-1.0.7-b03"
Host: 0.0.0.0:1344
Encapsulated: req-hdr=0, req-body=136
Connection: keep-alive
```

```
PUT /scp/today HTTP/1.1
```

Host: 172.16.200.11

Content-Type: application/octet-stream

Transfer-Encoding: chunked

Content-Length: 29

1d

Tue Sep 20 04:01:50 UTC 2022

3. On a Linux client, copy the file from the server locally using SCP:

```
scp fosqa@172.16.200.33:/home/fosqa/ssh_depot/today2/
```

4. Similar outputs are observed. The ICAP client request indicates that the file is copied from the SSH server:

```
PUT /scp/today2 HTTP/1.1
```

Host: 172.16.200.33

Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

Web application firewall profiles cannot be used NGFW policy-based mode. See [NGFW policy on page 1192](#) for more information.

The following topic provides information about WAF profiles:

- [Protecting a server running web applications on page 1680](#)

Protecting a server running web applications

You can use a web application firewall profile to protect a server that is running a web application, such as webmail.

Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.

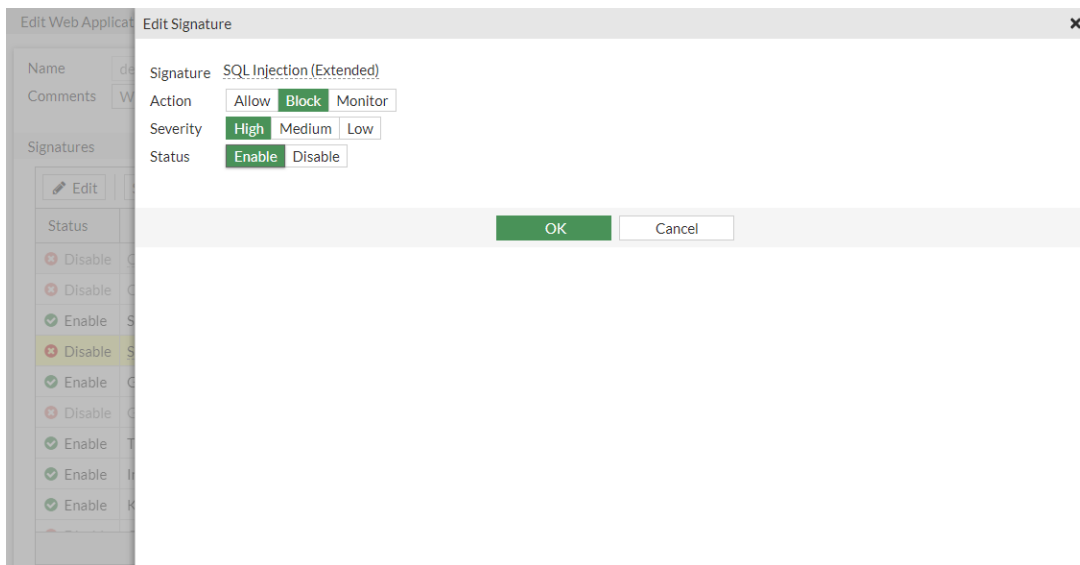

In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.

To protect a server running web applications:

1. Enable the web application firewall:
 - a. Go to *System > Feature Visibility*.
 - b. Under *Security Features*, enable *Web Application Firewall*.
 - c. Click *Apply*.
2. Edit the default web application firewall profile (*Trojans* and *Known Exploits* are blocked by default):
 - a. Go to *Security Profiles > Web Application Firewall* and edit the *default* profile signature.
 - b. Select *SQL Injection (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.
 - c. Click *OK*.

- d. Enable *Generic Attacks (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.

- e. Click OK.

Status	Signature	Action	Severity
Disable	Cross Site Scripting	Monitor	Low
Disable	Cross Site Scripting (Extended)	Monitor	Low
Enable	SQL Injection	Block	High
Enable	SQL Injection (Extended)	Block	High
Enable	Generic Attacks	Block	High
Enable	Generic Attacks(Extended)	Block	High
Enable	Trojans	Block	High
Enable	Information Disclosure	Monitor	Medium
Enable	Known Exploits	Block	High

- f. Click OK.

3. Apply the profile to a security policy:

- Go to *Policy & Objects > Firewall Policy* and edit the policy that allows access to the web server.
- For *Firewall / Network Options*, select the appropriate *Protocol Option*.
- For *Security Profiles*, enable *Web Application Firewall* and set it to use the *default* profile.
- Set the *SSL Inspection* to use the *deep-inspection* profile.
- Configure the other settings as needed.
- Click OK.

4. Verify that the web application firewall blocks traffic:

- Use the following URL to simulate an attack on your web server and substitute the IP address of your server:
`http://<server IP>/index.php?username=1'%20or%20'1'%20=%20'1&password=1'%20or%20'1'%20=%20'1`
 An error message appears, stating that the web application firewall has blocked the traffic:

Data leak prevention

The FortiGate data leak prevention (DLP) system prevents sensitive data from leaving or entering your network by scanning for various patterns while inspecting traffic passing through the FortiGate. Data matching defined sensitive data patterns is blocked, logged, allowed, or quarantined when it passes through the FortiGate.

The DLP system is configured based on the following components:

Component	Description
Data type	Define the type of pattern that DLP is trying to match. For example, this can be a pre-defined type such as keyword, regex, hex, credit card, US social security number (SSN), or other patterns. You can also create custom data types.
Dictionary	A collection of data type entries. When selecting a data type such as keyword, regex or hex, define the pattern that you are looking for.
Sensor	Define which dictionaries to check. You can match any dictionary, all dictionaries, or a special logical combination of the dictionaries. It can also count the number of dictionary matches to trigger the sensor.
File pattern	Define groups of file patterns based on pre-defined file types, or define your own pattern to match the file name.
DLP profile	Define rules for matching a sensor based on a file type or a message, and the type of protocol being used. It also allows you to choose the action to allow, log, block, or quarantine the address.

A DLP profile selects one or more sensors, and applies the sensor's pattern matching against the file type or message that is passing through selected protocols. The profile can be applied to a firewall policy where the traffic will be inspected.

In the backend, DLP uses Hyperscan to perform a one-parse algorithm for scanning multiple patterns. This allows DLP to scale up without any performance downgrade.

Protocol comparison between DLP inspection modes

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SFTP/SCP
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	No

DLP can be configured in both the CLI and the GUI irrespective of firewall policy inspection mode.

To use DLP profiles in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See [Configuring DLP from the CLI on page 1685](#) for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

Archiving

DLP can archive some or all of the content that passes through the DLP system. There are two forms of DLP archiving.

- **Summary only:** a summary of all the activity detected by the profile is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses a web browser, every URL that they visit is recorded.

- Full: detailed records of all the activity detected by the profile is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses a web browser, every page that they visit is archived.

You can configure the type of archiving per protocol.

Logging and blocking files by file name

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP profile. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

The following topics provide information about DLP:

- [Basic DLP settings on page 1683](#)
- [Advanced DLP configurations on page 1686](#)
- [DLP examples on page 1688](#)
- [DLP fingerprinting on page 1702](#)
- [FortiGuard DLP service on page 1706](#)

Basic DLP settings

DLP settings can be configured for data types, dictionaries, sensors, file patterns, and profiles. This topic includes three examples that incorporate several DLP settings. DLP can be configured in both the CLI and the GUI irrespective of firewall policy inspection mode.

To use DLP profile in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See [Configuring DLP from the CLI on page 1685](#) for more information.
DLP profiles can only be added to a flow-based firewall policy from the CLI.

On the *Security Profiles > Data Leak Prevention* page, there are *Profiles*, *Sensors*, and *Dictionaries* tabs to configure those DLP settings. DLP profiles can be added to proxy-based firewall policies and proxy policies from the GUI.

If *Data Leak Prevention* is not visible in the tree menu, go to *System > Feature Visibility* and enable it.

This section breaks down the DLP configuration into a sequence of steps:

1. Configure the DLP dictionary:
 - A DLP dictionary is a collection of data type entries. See [DLP data type on page 1686](#) for more information.
2. Configure the DLP sensor:

- A DLP sensor defines which dictionary to check. It counts the number of dictionary matches to trigger the sensor.
3. Configure the DLP profile:
 - A DLP profile allows for filtering by size and file type. See [DLP file pattern on page 1688](#) for custom file type.
 4. Add the DLP profile to a firewall policy.

All the steps mentioned above should be configured in the exact order given for ease of configuration.

Configuring DLP from the GUI

Use the following steps to configure DLP from the GUI.

To configure a DLP dictionary:

1. Go to *Security Profiles > Data Leak Prevention*.
2. Select the *Dictionaries* tab and click *Create New*.
3. Enter a name.
4. In the *Dictionary Entries* section, click *Create New*.
5. Set the *Type* and click *OK*.
6. Click *OK* to save the dictionary.

To configure a DLP sensor:

1. Go to *Security Profiles > Data Leak Prevention*.
2. Select the *Sensors* tab and click *Create New*.
3. Enter a name.
4. In the *Sensors Entries* section, click *Create New*.
5. Select the *Dictionary* from the dropdown menu and click *OK*.
6. Click *OK* to save the sensor.

To configure a DLP profile:

1. Go to *Security Profiles > Data Leak Prevention*.
2. Select the *Profiles* tab and click *Create New*.
3. Enter a name.
4. In the *Rules* section, click *Create New*.
5. Configure the following settings:

Name	Filter name.
Sensors	Select DLP sensors.
Severity	Select the severity or threat level that matches this filter.

Action	Action to take with content that this DLP profile matches.
Type	Select whether to check the content of messages (an email message) or files (downloaded files or email attachments).
File type	Select the number of a DLP file pattern table to match.
Protocol	Check messages or files over one or more of these protocols.

6. Click *OK*.
7. Click *OK* to save the profile.

To add the DLP profile to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*.
4. In the *Security Profiles* section, enable *DLP Profile* and select the desired profile.
5. Configure the other settings as needed.
6. Click *OK*.

Configuring DLP from the CLI

Use the following steps to configure DLP from the CLI.

To configure a DLP dictionary:

```
config dlp dictionary
  edit <name>
    config entries
      edit 1
        set type {credit-card | hex | keyword | mip-label | regex | ssn-us}
        set pattern <string>
        set repeat {enable | disable}
        set status {enable | disable}
      next
    end
  next
end
```

To configure a DLP sensor:

```
config dlp sensor
  edit <name>
    set match-type {match-all | match-any | match-eval}
    set eval <string>
    config entries
      edit <id>
        set dictionary <dlp_dictionary>
        set count <integer>
        set status {enable | disable}
      next
    end
  next
end
```

```
        end
    next
end
```

See [Evaluation by Logical relationship on page 1688](#) for more information about `match-eval`.

To configure a DLP profile:

```
config dlp profile
    edit <name>
        set feature-set {flow | proxy}
        config rule
            edit <id>
                set proto <protocol> <protocol> ...
                set sensor <dlp_sensor>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

To add the DLP profile to a firewall policy:

```
config firewall policy
    edit <id>
        set srcintf <interface>
        set dstintf <interface>
        set action accept
        set srcaddr <address>
        set dstaddr <address>
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set dlp-profile <string>
    next
end
```

See [DLP examples on page 1688](#) for sample configurations.

Advanced DLP configurations

The following topic provides information on advanced DLP configurations.

DLP data type

This configuration includes pre-defined data types to match for keyword, regex, hex, credit card, and social security number (SSN). Custom data types can be added.

```
config dlp data-type
    edit "keyword"
        set pattern "built-in"
    next
    edit "regex"
```

```

        set pattern "built-in"
    next
    edit "hex"
        set pattern "built-in"
    next
    edit "mip-label"
        set pattern "^[[:xdigit:]]{8}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]{12}$"
        set transform "built-in"
    next
    edit "credit-card"
        set pattern "\\b([2-6]{1}\\d{3})[- ]?(\\d{4})[- ]?(\\d{2})[- ]?(\\d{2})[- ]?(\\d{2,4})\\b"
        set verify "built-in"
        set look-back 20
        set transform "\\b\\1[- ]?\\2[- ]?\\3[- ]?\\4[- ]?\\5\\b"
    next
    edit "ssn-us"
        set pattern "\\b(\\d{3})-(\\d{2})-(\\d{4})\\b"
        set verify "(?!-)\b(?:666|000|9\\d{2})\\d{3}-(?!00)\\d{2}-(?!0{4})\\d{4}\\b(?:!-)"
        set look-back 12
        set transform "\\b\\1-\\2-\\3\\b"
    next
end

```

To add a custom DLP data type:

```

config dlp data-type
    edit <name>
        set pattern <string>
        set verify <string>
        set transform <string>
    next
end

```

pattern <string>	Enter a regular expression pattern string without a look around.
verify <string>	Enter a regular expression pattern string used to verify the data type.
transform <string>	Enter the template to transform user input to a pattern using the capture group from pattern.

To use "?" in a regex pattern, see [CLI basics on page 42](#). This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

DLP file pattern

A DLP file pattern can block, allow, log, or quarantine a file based on the specified file type in the file filter list (see [Supported file types on page 1621](#)).

To configure a DLP file pattern:

```
config dlp filepattern
  edit <id>
    set name <name>
    config entries
      edit <name>
        set filter-type {type | pattern}
        set file-type <file_type>
      next
    end
  next
end
```

Evaluation by Logical relationship

Evaluation by Logical relationship is a powerful tool used to combine multiple dictionary entries to define an accurate DLP sensor using logical expression.

Syntax example:

1. set eval "dict(1) == 2"
Match DLP sensor only when dictionary one match count is two.
2. set eval "(dict(1) + dict(2)) == 3"
Match DLP sensor only when dictionary one and dictionary two combined match count is three.
3. set eval "(dict(1) == 2) && (dict(2) == 1)"
Match DLP sensor only when dictionary one match count is equal to two and dictionary two match count is equal to one.
4. set eval "(dict(1) == 2) || (dict(2) == 1)"
Match DLP sensor only when dictionary one match count is equal to two or dictionary two match count is equal to one.
5. set eval "dict(1) > dict(2)"
Match DLP sensor only when dictionary one match count is greater than dictionary two match count.

See [Example 4: Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation via logical expression on page 1698](#).

DLP examples

This topic includes examples that incorporate several DLP settings:

- [Example 1: Block HTTPS upload traffic that includes credit card information on page 1689](#)
- [Example 2: Log FTP upload traffic with a specific pattern on page 1692](#)

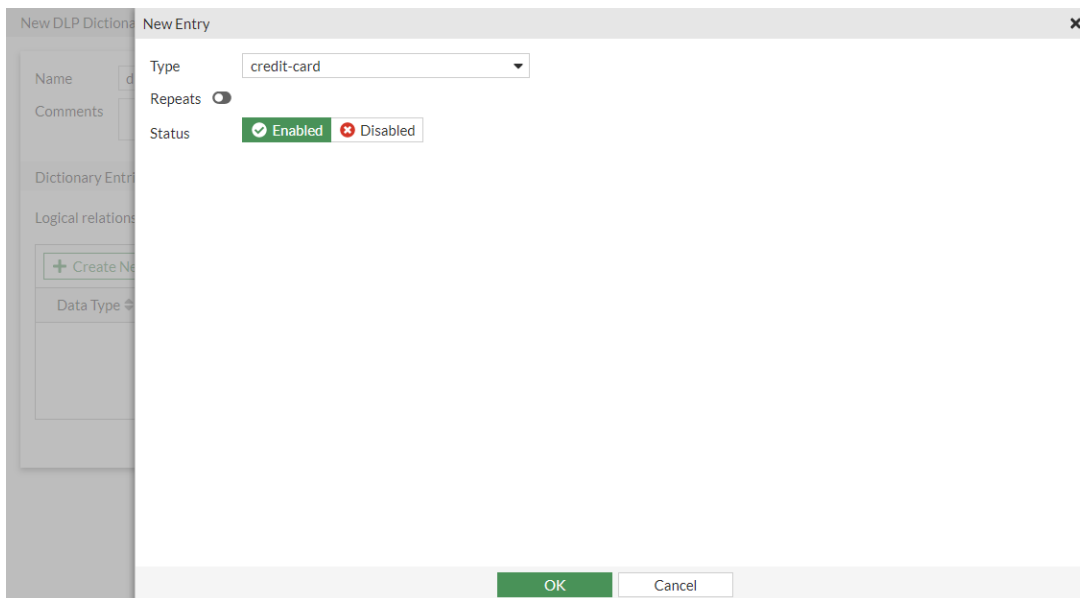

- [Example 3: Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 1697](#)
- [Example 4: Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation via logical expression on page 1698](#)

Example 1: Block HTTPS upload traffic that includes credit card information

This configuration will block HTTPS upload traffic that includes credit card information. The pre-defined data type for credit card is used in the dictionary.

To block HTTPS upload traffic that includes credit card information in the GUI:

1. Configure the DLP dictionary:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Dictionaries* tab, and click *Create New*.
 - b. Enter a name (*dic-case1*).
 - c. In the *Dictionary Entries* section, click *Create New*.
 - d. Set the *Type* to *credit-card* and click *OK*.

- e. Click *OK* to save the dictionary.
2. Configure the DLP sensor:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Sensors* tab, and click *Create New*.
 - b. Enter a name (*sensor-case1*).
 - c. In the *Sensor Entries* section, click *Create New*.
 - d. Set the *Dictionary* to *dic-case1* and click *OK*.

New DLP Sensor

New Entry

ID: 1

Dictionary: dlc-case1

Count: 1

Status: ☒ Enabled ☐ Disabled

OK Cancel

e. Click **OK** to save the sensor.

3. Configure the DLP profile:

- a. Go to **Security Profiles > Data Leak Prevention**, select the **Profiles** tab, and click **Create New**.
- b. Enter a name (*profile-case1*).
- c. In the **Rules** section, click **Create New**.
- d. Configure the following settings:

Name	<i>1</i>
Sensors	<i>sensor-case1</i>
Severity	<i>Medium</i>
Action	<i>Block</i>
Type	<i>File</i>
File type	<i>builtin-patterns</i>
Protocol	<i>HTTP-POST, HTTP-GET</i>

DLP Profile

New Rule

Name: 1

Sensors: sensor-case1

Severity: Medium

Action: ☒ Allow ☒ Log Only ☒ Block Quarantine IP Address

Type: ☒ File ☐ Message

File type: builtin-patterns

Protocol: ☐ SMTP ☐ POP3 ☒ HTTP-GET ☐ IMAP ☒ HTTP-POST ☐ FTP ☐ NNTP ☐ MAPI ☐ SSH ☐ CIFS

OK Cancel

- e. Click *OK*.
 - f. Click *OK* to save the profile.
4. Add the DLP profile to a firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set the *Inspection Mode* to *Proxy-based*.
 - c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case1*.
 - d. Configure the other settings as needed.
 - e. Click *OK*.

When a credit card is included in HTTP POST traffic, the file is blocked and a DLP log is generated.

To block HTTPS upload traffic that includes credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
  edit "dic-case1"
    config entries
      edit 1
        set type "credit-card"
      next
    end
  next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
  edit "sensor-case1"
    config entries
      edit 1
        set dictionary "dic-case1"
      next
    end
  next
end
```

3. Configure the DLP profile:

```
config dlp profile
  edit "profile-case1"
    set feature-set proxy
    config rule
      edit 1
        set name "1"
        set proto http-get http-post
        set filter-by sensor
        set file-type 1
        set sensor "sensor-case1"
        set action block
      next
    end
  next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "protocols"
    set dlp-profile "profile-case1"
    set nat enable
  next
end
```

When a credit card is included in HTTP POST traffic, a replacement message appears because it is blocked. A DLP log is generated.

Sample log

From Windows, the following command can be used to generate a sample log, using the cURL tool to post data, which contains a sample credit card number:

```
# curl -k -d 4024007149133315 https://172.16.200.55/card.doc -o?
```

```

Example 2: Log FTP upload traffic with a specific pattern

This configuration will log FTP upload traffic with the following patterns:

- keyword = demo
- regex = demo(regex){1,5}
- hex = e6b58be8af95

The dictionary entries have repeat match enabled. The DLP sensor is set so this is repeated five times.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the GUI:

1. Configure the DLP dictionary with three entries:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Dictionaries* tab, and click *Create New*.
 - b. Enter a name (*dic-case2*).
 - c. In the *Dictionary Entries* section, click *Create New*.
 - d. Set the *Type* to *keyword* and the *Pattern* to *demo*.
 - e. Enable *Repeats* and click *OK*.

New DLP Dictionary: New Entry

Name: dic-case2

Comments:

+ Create New Edit Delete

Data Type	Status	Pattern	Repeats
keyword	Enable	demo	Enable
regex	Enable	demo(regex){1,5}	Enable
hex	Enable	e6b58be8af95	Enable

OK Cancel

- f. Repeat these steps to add dictionary entries for the following (with *Repeats* enabled):
 - i. Set the *Type* to *regex* and the *Pattern* to *demo(regex){1,5}*.
 - ii. Set the *Type* to *hex* and the *Pattern* to *e6b58be8af95*.

- g. Click *OK* to save the dictionary.
2. Configure the DLP sensor:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Sensors* tab, and click *Create New*.
 - b. Enter a name (*sensor-case2*).
 - c. In the *Sensor Entries* section, click *Create New*.

- d. Set the *Dictionary* to *dic-case2*, set the *Count* to 5, and click *OK*.

New DLP Sensor

New Entry

ID: 1

Dictionary: dic-case2

Count: 5

Status: ☒ Enabled ☐ Disabled

OK Cancel

- e. Click *OK* to save the sensor.

3. Configure the DLP profile:

- Go to *Security Profiles > Data Leak Prevention*, select the *Profiles* tab, and click *Create New*.
- Enter a name (*profile-case2*).
- In the *Rules* section, click *Create New*.
- Configure the following settings:

Name	1
Sensors	sensor-case2
Severity	Medium
Action	Block
Type	File
File type	builtin-patterns
Protocol	FTP

DLP Profile

New Rule

Name: 1

Sensors: sensor-case2

Severity: Medium

Action: ☒ Allow ☐ Log Only ☒ Block ☐ Quarantine IP Address

Type: ☒ File ☐ Message

File type: builtin-patterns

Protocol: ☐ SMTP ☐ POP3 ☐ IMAP ☐ HTTP-GET ☐ HTTP-POST ☒ FTP ☐ NNTP ☐ MAPI ☐ SSH ☐ CIFS

OK Cancel

- e. Click *OK*.
 - f. Click *OK* to save the profile.
4. Add the DLP profile to a firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set the *Inspection Mode* to *Proxy-based*.
 - c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case2*.
 - d. Configure the other settings as needed.
 - e. Click *OK*.
5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
A DLP log is generated after the FTP traffic passes.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
  edit "dic-case2"
    config entries
      edit 1
        set type "keyword"
        set pattern "demo"
        set repeat enable
      next
      edit 2
        set type "regex"
        set pattern "demo(regex){1,5}"
        set repeat enable
      next
      edit 3
        set type "hex"
        set pattern "e6b58be8af95"
        set repeat enable
      next
    end
  next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
  edit "sensor-case2"
    config entries
      edit 1
        set dictionary "dic-case2"
        set count 5
      next
    end
  next
end
```

3. Configure the DLP profile:

```
config dlp profile
  edit "profile-case2"
    set feature-set proxy
    config rule
      edit 1
        set proto ftp
        set filter-by sensor
        set file-type 1
        set sensor "sensor-case2"
        set action block
      next
    end
  next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "protocols"
    set dlp-profile "profile-case2"
    set nat enable
  next
end
```

- 5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.**
A DLP log is generated after the FTP traffic passes.

Sample log

```
1: date=2022-10-26 time=12:37:57 eventtime=1666813077679725858 tz="-0700"
logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root"
filteridx=1 filtername="1" dlpeextra="builtin-patterns;sensor-case2" filtertype="sensor"
filtercat="file" severity="medium" policyid=1 poluuid="891a526a-51cd-51ed-577a-
6505bec88af9" policytype="policy" sessionid=6267 epoch=909159520 eventid=0
srcip=10.1.100.11 srcport=52858 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" srcuuid="502d2c8e-51cd-51ed-a24e-a091f4ff6fed"
dstip=172.16.200.55 dstport=43411 dstcountry="Reserved" dstintf="port1"
dstintfrole="undefined" dstuuid="502d2c8e-51cd-51ed-a24e-a091f4ff6fed" proto=6
service="FTP" filetype="msoffice" direction="outgoing" action="block"
filename="realizedDoc.doc" filesize=26624 profile="profile-case2"
```

Example 3: Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB

This configuration will block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB.

To block HTTPS download of EXE files and log downloads larger than 500 KB:

1. Configure the DLP file pattern:

```
config dlp filepattern
  edit 3
    set name "case3-exe"
    config entries
      edit "exe"
        set filter-type type
        set file-type exe
      next
    end
  next
end
```

2. Configure the DLP profile:

```
config dlp profile
  edit "profile-case3-type-size"
    config rule
      edit 1
        set proto http-get
        set filter-by none
        set file-type 3
        set action block
      next
      edit 2
        set proto http-get
        set filter-by none
        set file-size 500
        set action log-only
      next
    end
  next
end
```

3. Add the DLP profile to a firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
```

```

set ssl-ssh-profile "custom-deep-inspection"
set dlp-profile "profile-case3-type-size"
set logtraffic all
set nat enable
next
end

```

4. Download an EXE file using HTTPS. The download is blocked, a replacement message appears, and a DLP log is generated.

Sample log

```

1: date=2022-02-15 time=11:54:29 eventtime=1644954869682887856 tz="-0800"

filesize=10502090 profile="profile-case3-type-size"

```

Example 4: Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation via logical expression

This example will allow users to create a subset of the existing DLP data type, *credit-card*. It can be very beneficial for an organization that wants to prevent only certain types of credit cards and not all.

This configuration will block HTTPS traffic that includes Visa or Mastercard information. Two dictionary entries with DLP data-type regex are created with custom patterns to match Visa and Mastercard numbers respectively, and a third dictionary entry is created with pre-defined data type *credit-card*. All three entries are used in the sensor using evaluation via logical expression to further supplement the detection.

In the CLI, evaluation via logical expression can be defined using the command `match-eval`. It is a tool used to combine multiple entries to define an accurate DLP sensor.

Sample topology

In this example, a Microsoft Office document with Visa credit card information is sent securely to the receiver using the HTTP POST method. The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the GUI:

1. Configure the DLP dictionary:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Dictionaries* tab, and click *Create New*.
 - b. Create an entry for Visa:
 - i. Enter a name (*Finance_Credit_Card_Visa*).
 - ii. In the *Dictionary Entries* section, click *Create New*.
 - iii. Set the *Type* to *regex*.
 - iv. Set *Pattern* to `4[0-9]{12}([0-9]{3})` and click *OK*.
 - v. Click *OK* to save the dictionary.
 - c. Create an entry for Mastercard:
 - i. Enter a name (*Finance_Credit_Card_Mastercard*).
 - ii. In the *Dictionary Entries* section, click *Create New*.
 - iii. Set the *Type* to *regex*.
 - iv. Set *Pattern* to `(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-9]|2720)[0-9]{12}` and click *OK*.
 - v. Click *OK* to save the dictionary.
 - d. Create an entry for Credit Card:
 - i. Enter a name (*CC_Number*).
 - ii. In the *Dictionary Entries* section, click *Create New*.
 - iii. Set the *Type* to *credit-card* and click *OK*.
 - iv. Click *OK* to save the dictionary.
2. Configure the DLP sensor:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Sensors* tab, and click *Create New*.
 - b. Enter a name (*Finance_Credit_Card_High*).
 - c. In the *Sensor Entries* section, click *Create New*.
 - d. Set the *Dictionary* to *Finance_Credit_Card_Visa* and click *OK*.
 - e. Repeat the previous step twice to add *Finance_Credit_Card_Mastercard* and *CC_Number* in this order.
 - f. Click *OK* to save the sensor.
 - g. Edit the newly created sensor.
 - h. Set the *Logical relationship* to *Evaluate*.
 - i. In the *Evaluated by* field, enter `(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)`.
 - j. Click *OK* to save the sensor.

For the DLP sensor with the *Logical relationship* set to *Evaluate*, *Count* and *Status* of any sensor entry will be ignored.

3. Configure the DLP profile:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Profiles* tab, and click *Create New*.
 - b. Enter a name (*cc-block*).
 - c. In the *Rules* section, click *Create New*.
 - d. Configure the following settings:

Name	<i>1</i>
Sensors	<i>Finance Credit Card High</i>
Severity	<i>Critical</i>
Action	<i>Block</i>
Type	<i>File</i>
File type	<i>builtin-patterns</i>
Protocol	<i>HTTP-POST, HTTP-GET</i>

- e. Click OK.
 - f. Click OK to save the profile.
4. Add the DLP profile to a firewall policy:
- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set the *Inspection Mode* to *Proxy-based*.
 - c. In the *Security Profiles* section, enable *DLP Profile* and select *cc-block*.
 - d. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
 - e. Configure the other settings as needed.
 - f. Click OK.

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, the file is blocked and a DLP log is generated. See the [Sample log on page 1702](#) for details on how to test this configuration.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
  edit "Finance_Credit_Card_Visa"
    config entries
      edit 1
        set type "regex"
        set pattern "4[0-9]{12}([0-9]{3})"
        set repeat enable
        set comment "Visa"
      next
    end
  next
  edit "Finance_Credit_Card_Mastercard"
    config entries
      edit 1
        set type "regex"
        set pattern "(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-9]|2720)[0-9]{12}"
        set repeat enable
        set comment "Mastercard"
      next
    end
  next
  edit "CC_Number"
    config entries
```

```

        edit 1
            set type "credit-card"
        next
    end
next
end

```

To use "?" in a regex pattern, see [CLI basics on page 42](#). This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

2. Configure the DLP sensor:

```

config dlp sensor
    edit "Finance_Credit_Card_High"
        config entries
            edit 1
                set dictionary "Finance_Credit_Card_Visa"
            next
            edit 2
                set dictionary "Finance_Credit_Card_Mastercard"
            next
            edit 3
                set dictionary "CC_Number"
            next
        end
        set match-type match-eval
        set eval "(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)"
    next
end

```

3. Configure the DLP profile:

```

config dlp profile
    edit "cc_block"
        set feature-set proxy
        config rule
            edit 1
                set name "1"
                set severity critical
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "Finance_Credit_Card_High"
                set action block
            next
        end
    next
end

```

4. Add the DLP profile to a firewall policy:

```

config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
    
```

```
set action accept
set srcaddr "all"
set dstaddr "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set ssl-ssh-profile "deep-inspection"
set dlp-profile "cc_block"
set nat enable
next
end
```

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, a replacement message appears because it is blocked. A DLP log is generated. See the [Sample log on page 1702](#) for details on how to test this configuration.

Sample log

From Windows, the following command can be used to generate a sample log via HTTP POST traffic, using the cURL tool to post data, which contains a sample Visa credit card number:

```
# curl -k -d 4024007149133315 https://192.168.10.13/cc.doc -o?
```

```
1: date=2023-03-17 time=15:37:41 eventtime=1679092660998869199 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" filteridx=1
filtername="1" dlpeextra="builtin-patterns;Finance_Credit_Card_High" filtertype="sensor"
filtercat="file" severity="critical" policyid=1 poluuid="26540ed0-ae54-51ed-80eb-

srcintfrole="undefined" srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" dstip=192.168.10.13
dstport=443 dstcountry="Reserved" dstintf="port3" dstintfrole="wan" dstuuid="3342cb44-9140-
51ed-5dbe-8e0787bedeec" proto=6 service="HTTPS" filetype="msoffice" direction="incoming"
action="block" hostname="192.168.10.13" url="https://192.168.10.13/cc.doc"
agent="curl/7.83.1" httpmethod="POST" filename="cc.doc" filesize=12288 profile="cc-block"
```

DLP fingerprinting

DLP fingerprinting can be used to detect sensitive data. The file that the DLP profile filters is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate generates a fingerprint for all the files that are detected in network traffic, and compares all the checksums stored in its database. If a match is found, the configured action is taken. Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

Using fingerprinting requires:

1. [Selecting the files to be fingerprinted by targeting a document source.](#)
2. [Adding fingerprinting filters to DLP profiles.](#)
3. Adding the profiles to firewall policies that accept traffic that the fingerprinting will be applied on.

The document fingerprint feature requires a FortiGate that has internal storage.

To configure a DLP fingerprint document:

```

config dlp fp-doc-source
  edit <name>
    *set server-type samba
    *set server <string>
    set period {none | daily | weekly | monthly}
    set vdom {mgmt | current}
    set scan-subdirectories {enable | disable}
    set remove-deleted {enable | disable}
    set keep-modified {enable | disable}
    *set username <string>
    set password <password>
    set file-path <string>
    set file-pattern <string>
    *set sensitivity <Critical | Private | Warning>
    set tod-hour <integer>
    set tod-min <integer>
    set weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday}
    set date <integer>
  next
end

```

Parameters marked with an asterisk (*) are mandatory and must be filled in.

Command	Description
server-type samba	Set the protocol used to communicate with document server. Only Samba (SMB) servers are supported.
server <string>	Enter the IPv4 or IPv6 address of the server.
period {none daily weekly monthly}	Set the frequency that the FortiGate checks the server for new or changed files.
vdom {mgmt current}	Enter the VDOM that can communicate with the file server.
scan-subdirectories {enable disable}	Enable/disable scanning subdirectories to find files.
remove-deleted {enable disable}	Enable/disable keeping the fingerprint database up to date when a file is deleted from the server.
keep-modified {enable disable}	Enable/disable keeping the old fingerprint and adding a new one when a file is changed on the server.
username <string>	Enter the user name required to log into the file server.
password <password>	Enter the password required to log into the file server.
file-path <string>	Enter the path on the server to the fingerprint files.
file-pattern <string>	Enter the pattern for matching files on the server to be fingerprinted.
sensitivity <Critical Private Warning>	Set the sensitivity or threat level for matches with this fingerprint database.

Command	Description
<code>tod-hour <integer></code>	Set the hour of the day. This option is only available when <code>period</code> is not <code>none</code> .
<code>tod-min <integer></code>	Set the minute of the hour. This option is only available when <code>period</code> is not <code>none</code> .
<code>weekday {sunday monday tuesday wednesday thursday friday saturday}</code>	Set the day of the week. This option is only available when <code>period</code> is <code>weekly</code> .
<code>date <integer></code>	Set the day of the month. This option is only available when <code>period</code> is <code>monthly</code> .

To configure a DLP fingerprint profile:

```

config dlp profile
  edit <name>
    set feature-set proxy
    config rule
      edit <id>
        set proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi |
ssh | cifs}
        set filter-by fingerprint
        set sensitivity {Critical | Private | Warning}
        set match-percentage <integer>
        set action {allow | log-only | block | ban | quarantine-ip}
      next
    end
  next
end

```

Command	Description
<code>proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}</code>	Set the protocol to inspect.
<code>filter-by fingerprint</code>	Set to match against a fingerprint sensitivity.
<code>sensitivity {Critical Private Warning}</code>	Set the DLP file pattern sensitivity to match.
<code>match-percentage <integer></code>	Set the percentage of the checksum required to match before the profile is triggered.
<code>action {allow log-only block ban quarantine-ip}</code>	Set the action to take with content that matches the DLP profile.

View the DLP fingerprint database on the FortiGate

Use `diagnose test application dlpfingerprint <integer>` to display the fingerprint information that is on the FortiGate.

Integer	Function
1	Show the fingerprint daemon menu
2	Dump the database
3	Dump all files
5	Dump all chunks
6	Refresh all document sources in all VDOMs
7	Show the database file size and limit
9	Display statistics
10	Clear statistics
99	Restart this daemon

To dump all fingerprinted files:

```
# diagnose test application dlpfingerprint 3
DLPFP diag_test_handler called
File DB:
```

```
-----
id, filename,                                vdom, archive, deleted, scanTime,  docSourceSrvr,
sensitivity, chunkCnt, reviseCnt,
1, /fingerprint/upload/1.txt,                vdom1, 0,      0,      1494868196,  1,      2,

FortiGuard DLP service

The FortiGuard DLP service offers a database of predefined DLP patterns such as data types, dictionaries, and sensors. Example include:

- Drivers licenses for various countries, various states in the USA, and various provinces in Canada
- Tax numbers for various countries

- Credit card numbers
- Bank statements

When enabled, the DLP database (DLDB) is downloaded to the FortiGate and its predefined patterns can be configured in DLP profiles.

To configure DLP database updates:

```
config system fortiguard
    set update-dldb {enable | disable}
end
```

To verify the database signature status:

```
# diagnose autoupdate versions
...
DLP Signature
-----
Version: 1.00010 signed
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan 27 15:25:00 2023
Last Update Attempt: Mon Jan 30 15:18:39 2023
Result: No Updates
```

Example

In this example, the administrator wants to look for data leakage of Canadian social insurance number (SIN) information and block this traffic. A DLP profile is created that uses the predefined dictionary, fg-can-natl_id-sin-dic, to check for Canadian Social Insurance Numbers (SINs).

Profiles Sensors Dictionaries				
<div> + Create new Edit Delete Search </div>				
Name	Match Type	Data Type	Comments	Ref.
fg-can-natl_id-sin-dic	Any		Canadian SIN Card Number Dictionary	0
fg-can-natl_id-sin-keywords	Any		Keywords for Canadian SIN Card Number	0
fg-cc-lua-test-dic	Any		dictionary containing cc-lua	0
fg-dlc_matcharound	Any		test matcharound	0
fg-EICAR-TEST-FILE	Any		EICAR Test File	0
fg-glb-cc-amex-auto	Any		American Express Credit Card Number	0
fg-key	Any		test matcharound	0

To verify that the Canadian SIN data type is added to the list of predefined data types:

```
show dlp data-type
config dlp data-type
    ...
    edit "fg-can-natl_id-proximity"
        set pattern "fortiguard dlp signature"
    next
end
```

To configure the DLP profile in the GUI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Sensors* tab, and click *Create New*.
 - b. Enter a name (*sin*).
 - c. In the *Sensor Entries* section, click *Create New*.
 - d. Set the *Dictionary* to *fg-can-natl_id-sin-dic* and click *OK*.

The screenshot shows two overlapping windows in the FortiGuard GUI. The background window is titled 'New DLP Sensor' and has fields for 'Name' (set to 'sin'), 'Comments', 'Sensor Entries', and 'Logical relationship' (set to 'Any'). The foreground window is titled 'New Entry' and contains the following fields: 'ID' (set to '1'), 'Dictionary' (set to 'fg-can-natl_id-sin-dic'), 'Count' (set to '1'), and 'Status' (with 'Enabled' selected). At the bottom of the 'New Entry' window are 'OK' and 'Cancel' buttons.

- e. Click *OK* to save the sensor.
2. Configure the DLP profile:
 - a. Go to *Security Profiles > Data Leak Prevention*, select the *Profiles* tab, and click *Create New*.
 - b. Enter a name (*test*).
 - c. In the *Rules* section, click *Create New*.
 - d. Configure the following settings:

Name	<i>test</i>
Sensors	<i>sin</i>
Severity	<i>Medium</i>
Action	<i>Block</i>
Type	<i>File</i>
File type	<i>all_executables</i>
Protocol	<i>SMTP, POP3, IMAP, HTTP-GET, HTTP-POST, FTP</i>

- e. Click OK.
- f. Click OK to save the profile.

To configure the DLP profile in the CLI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:

```
config dlp sensor
  edit "sin"
    config entries
      edit 1
        set dictionary "fg-can-natl_id-sin-dic"
      next
    end
  next
end
```

2. Configure the DLP profile:

```
config dlp profile
  edit "test"
    set feature-set proxy
    config rule
      edit 1
        set name "test"
        set proto smtp pop3 imap http-get http-post ftp
        set filter-by sensor
        set file-type 2
        set sensor "sin"
        set action block
      next
    end
  next
end
```

Virtual patching - NEW

Virtual patching is a method for mitigating vulnerability exploits against OT devices by applying patches virtually on the FortiGate. This is done in several steps:

1. A FortiGate uses the OT Detection signatures and service to collect device information from OT devices that are connected to an interface.
2. The device information is used to perform a vulnerability lookup by querying FortiGuard for device-specific vulnerabilities and mitigation rules.
3. The FortiGate caches the applicable signatures and mitigation rules that apply to each device, mapped to the MAC address of the device.
4. When a virtual patching profile is applied to a firewall policy, traffic that enters the firewall policy is subject to signature matching on a per-device basis.
 - a. The IPS engine uses the MAC address of the device to match any mitigation rules that should apply.
 - b. If the MAC address is in the exempted list, then patching is exempted or skipped.
 - c. If the signature rule is in the exempted list, then patching is also exempted or skipped for that signature.
 - d. Otherwise, all applicable rules for the device will be applied.

A virtual patching profile can be applied to firewall policies in any direction, protecting traffic from or to the vulnerable OT devices. Virtual patching profiles can also be combined with virtual patching on NAC policies, so that vulnerable OT devices are first assigned to a protected VLAN, and then firewall policies associated with the VLAN will apply the virtual patching profile. See [OT and IoT virtual patching on NAC policies on page 1717](#) for more information.

The following are requirements for the virtual patching feature:

- Purchase the appropriate OT-related license (virtual patching only applies to OT devices). See [Operational Technology Security Service](#) for more information.
- Enable device detection on the LAN interface.
 - In the GUI, go to *Network > Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*.
 - In the CLI, enter:

```
config system interface
  edit <name>
    set device-identification enable
  next
end
```
- Configure a firewall policy with an application control profile in order for device detection to occur. OT device detection collects device information by triggering application control signatures.

The following options can be configured in a virtual patching profile:

GUI option	CLI option	Description
Basic profile settings		
<i>Name</i>	<code>name <string></code>	Enter a unique name for the profile.
<i>Severity</i>	<code>severity {low medium high critical}</code>	Set the relative severity of the signature, from low to critical.
<i>Action</i>	<code>action {pass block}</code>	Set the action to take for a matched device:

GUI option	CLI option	Description
		<ul style="list-style-type: none"> <i>Pass/pass</i>: allow sessions that match the profile. <i>Block/block</i>: block sessions that match the profile (default).
<i>Logging</i>	<code>log {enable disable}</code>	Enable/disable detection logging. This setting is enabled by default.
<i>Comments</i>	<code>comment <var-string></code>	Enter a comment (optional).
Virtual patching exemptions settings		
<i>Status</i>	<code>status {enable disable}</code>	Enable/disable exemption.
<i>MAC addresses</i>	<code>device <mac_address1>, <mac_address2>, ...</code>	Enter the device MAC addresses to exempt.
<i>Signature ID</i>	<code>rule <id1>, <id2>, ...</code>	Enter the pre-defined or custom signatures to exempt.

Example 1: basic configuration

This example demonstrates the flow for OT virtual patching from start to finish. First, a device (10.1.100.22) goes through device detection, which matches an OT detection signature downloaded on the FortiGate. Next, known vulnerabilities and OT patch signatures for this device are mapped to its MAC address. When traffic is generated by this device, IPS scans the traffic to identify any traffic patterns that match known OT patch signatures for this device. If a match is found, traffic is blocked by the FortiGate.

For demonstrative purposes, the simulated vulnerable OT device is a PC simulating web traffic from an iPad. An OT detection signature is specially crafted to match this Apple iPad traffic to the OT device category. To simulate vulnerable traffic, a test OT patch signature is used to match a generic cross-site scripting (XSS) attack over HTTP.

To verify the status of the OT related definitions:

1. Verify the current contracts licensed to the FortiGate:

```
# diagnose test update info
...
OTDT,Mon Sep 24 17:00:00 2029
OTVP,Mon Sep 24 17:00:00 2029
...
```

2. Verify the versions and status of the OT definitions:

```
# diagnose autoupdate versions
...
```

```
OT Detect Definitions
-----
Version: 23.00545 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:40:03 2023
Last Update Attempt: n/a
Result: Updates Installed
--
OT Patch Definitions
-----
Version: 23.00505 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:39:50 2023
Last Update Attempt: n/a
Result: Updates Installed
...
```

3. View the OT detection rules downloaded on the FortiGate. In this example, the OT detection rule ID 1000870 is a specially crafted signature to match Apple iPad traffic to the OT category:

```
# get rule otdt status
app-name: "Apple.iPad"
id: 10000870
category: "OT"
cat-id: 34
popularity: 5.low
risk: 1.medium
weight: 10
shaping: 0
protocol: 1.TCP, 9.HTTP
vendor: 7.Apple
technology: 0.Network-Protocol
behavior:
dev_cat: Other
```

4. View the OT patch rules downloaded on the FortiGate. In this example, the OT patch rule is a specially crafted signature to match a generic XSS attack to a vulnerability:

```
# get rule otvp status
rule-name: "WAP.Generic.XSS"
rule-id: 10000684
rev: 20.321
date: 1653379200
action: pass
status: enable
log: disable
log-packet: disable
severity: 2.medium
service: TCP, HTTP
location: server
os: Other
application: Other
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
```

```
vuln_type: XSS
cve: 20198625
```

To configure virtual patching in the GUI:

1. Enable device detection on port2 :
 - a. Go to *Network > Interfaces* and edit port2.
 - b. In the *Network* section, enable *Device detection*.
 - c. Click *OK*.
2. Configure the virtual patching profile:
 - a. Go to *Security Profiles > Virtual Patching* and click *Create New*.
 - b. Configure the following settings:

Name	<i>test</i>
Severity	Select <i>Low, Medium, High, and Critical</i>
Action	<i>Block</i>
Logging	<i>Enable</i>

- c. Click *OK*.
3. Apply the virtual patching profile to a firewall policy for traffic from port2 to port1:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*test*).
 - c. Enable *Application Control* and select an application control profile (*default*).
 - d. Set *SSL Inspection* to a profile that uses deep inspection profile in order to scan SSL encrypted traffic.
 - e. Configure the other settings as needed.
 - f. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on port2:

```
config system interface
  edit "port2"
    set device-identification enable
  next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
  edit "test"
    set comment ''
    set severity low medium high critical
    set action block
    set log enable
  next
end
```

3. Apply the virtual patching profile to a firewall policy:

```

config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "custom-deep-inspection"
    set application-list "default"
    set virtual-patch-profile "default"
    set nat enable
  next
end

```

To test the virtual patching:

1. On the PC, generate traffic that simulates web traffic from an iPad. This traffic is generated in order for the FortiGate to perform device detection on port2. The OT detection signature 10000870 will be triggered, which considers this traffic from an OT device in this simulated scenario:

```
# curl 172.16.200.55 -H "User-Agent: Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X)
AppleWebKit/605.1.15 (KHTML, like Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1"
```

A log is generated, indicating the traffic that triggered the match:

```

3: date=2023-07-24 time=15:31:26 eventtime=1690237885960202460 tz="-0700"
logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature"
level="information" vd="root" appid=10000870 srcip=10.1.100.22 srccountry="Reserved"
dstip=172.16.200.55 dstcountry="Reserved" srcport=51548 dstport=80 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 service="HTTP"
direction="outgoing" policyid=1 poluid="a3424268-1ffc-51ed-3ba9-f3a60e2271cf"
policytype="policy" sessionid=7284 applist="default" action="pass" appcat="OT"
app="Apple.iPad" hostname="172.16.200.55" incidentserialno=18882457 url="/"
agent="Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X) AppleWebKit/605.1.15 (KHTML, like
Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1" httpmethod="GET" msg="OT: Apple.iPad"
clouddevice="Vendor=Apple, Product=ipados, Version=12.5.5, Firmware=IOS" apprisk="low"

```

The FortiGate queries the FortiGuard OT query service with information about the OT device vendor and product. The service responds with the vulnerabilities and patch_sign_id applicable to this device. IPS caches this information in its device vulnerability database.

2. Verify the vulnerability by device MAC and IP address:

```

# diagnose user-device-store device memory vulnerability-query f2:d7:39:5d:40:21
10.1.100.22
Got 28 vulnerabilities, response size:1792
[Vulnerability-0]
  'vulnerability_id' = '110977'
  'severity' = '2'
  'signature' = '10000684'

```

3. Verify the virtual patch signatures stored and enabled on the FortiGate:

```

# diagnose ips share list otvp_cfgcache
f2:d7:39:5d:40:21 1 10000684

```

4. Using the vulnerable device 10.1.100.22, generate vulnerable traffic to the destination server 172.16.200.55. The traffic from this IP and MAC address triggers OT patch signature 1000684 to match and is subsequently blocked by the firewall policy:

```
# curl -X POST http://172.16.200.55/'index.html?<javascript>'
```

5. Verify the UTM virtual patch log that was recorded with information about the vulnerability that was virtually patched:

```
# execute log filter category 24
# execute log display
2 logs found.
2 logs returned.

1: date=2023-07-20 time=16:03:00 eventtime=1689894179977743851 tz="-0700"
logid="2400064600" type="utm" subtype="virtual-patch" eventtype="virtual-patch"

httpmethod="POST" direction="outgoing" attackid=10000684
```

Example 2: NAC policy

In this example, a NAC policy is pre-configured to detect devices with information or higher vulnerabilities, as demonstrated in [OT and IoT virtual patching on NAC policies on page 1717](#). The NAC policy assigns the devices to vlan300.

A virtual patching profile is created to block any vulnerabilities with low, medium, high, or critical severity. The profile is applied to a firewall policy for outbound traffic.

To configure virtual patching in the GUI:

1. Enable device detection on vlan300:
 - a. Go to *Network > Interfaces* and edit vlan300.
 - b. In the *Network* section, enable *Device detection*.
 - c. Click *OK*.
2. Configure the virtual patching profile:
 - a. Go to *Security Profiles > Virtual Patching* and click *Create New*, or edit an existing profile.
 - b. Configure the following settings:

Name	<i>OT_check</i>
Severity	Select <i>Low</i> , <i>Medium</i> , <i>High</i> , and <i>Critical</i>
Action	<i>Block</i>

Logging*Enable*

- c. Click OK.
3. Apply the virtual patching profile to a firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
 - b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*OT_check*).
 - c. Enable *Application Control* and select an application control profile (*default*).
 - d. Configure the other settings as needed.
 - e. Click OK.

To configure virtual patching in the CLI:

1. Enable device detection on vlan300:

```
config system interface
  edit "vlan300"
    set device-identification enable
  next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
  edit "OT_check"
    set severity low medium high critical
  next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
  edit 1
    set name "virtualpatch-policy"
    set srcintf "vlan300"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set application-list "default"
    set virtual-patch-profile "OT_check"
    set logtraffic all
  next
end
```

4. Verify the logs:

```
# execute log filter category utm-virtual-patch
# execute log display
...
1: date=2023-06-20 time=16:21:00 eventtime=1686180059982988434 tz="-0700"
logid="2400064600" type="utm" subtype="virtual-patch" eventtype="virtual-patch"
level="warning" vd="root" severity="medium" srcip=10.1.100.11 srccountry="Reserved"
dstip=172.16.200.55 dstcountry="Reserved" srcintf="vlan300" srcintfrole="undefined"
```

```

```

OT and IoT virtual patching on NAC policies

OT and IoT virtual patching can be applied to a NAC policy by setting the category to *Vulnerability* and configuring the *Match* criteria based on severity. Devices that match the criteria can be assigned and isolated to a NAC VLAN.

Example

In this example, a device with a certain vulnerability severity is detected by the NAC policy on the FortiGate. Subsequently, the FortiSwitch port in which it is connected to is moved to vlan300 where traffic can be controlled for vulnerable devices. For more information about NAC policies, see [Defining a FortiSwitch NAC policy](#) in the FortiLink Administration Guide. This example assumes the vlan300 has already been configured.

The following settings are required for IoT device detection:

- A valid IoT Detection Service license to download the IoT signature package.
- Enable device detection on the LAN interface used by IoT devices.
 - In the GUI, go to *Network > Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*.
 - In the CLI, enter:

```
config system interface
  edit <name>
    set device-identification enable
  next
end
```

- Configure a firewall policy with an application control sensor.

To configure virtual patching on NAC policies

1. Configure the NAC policy:
 - a. Go to *WiFi & Switch Controller > NAC Policies* and click *Create New*, or edit an existing policy.
 - b. In the *Device Patterns* section, set *Category* to *Vulnerability*.
 - c. Set *Match* to *Severity is at least* and select a severity level (*Information* is used in this example).
 - d. In the *Switch Controller Action* section, enable *Assign VLAN* and select *vlan300*.

OK

Cancel

- e. Configure the other settings as needed.
 - f. Click *OK*.
2. Enable NAC mode on the desired FortiSwitch ports (port6 in this example):
 - a. Go to *WiFi & Switch Controller > FortiSwitch Ports*.
 - b. Select *port6*, then right-click and set the *Mode* to *NAC*.
3. Once the NAC policy is matched, go to *WiFi & Switch Controller > NAC Policies* to view the device matched to the policy.

+ Create New		Edit	Delete	Search		View Matched Devices
Name	Patterns	Assign	Matched Devices	Ref.		
<div> NAC Policies 1 </div>						
IoT	<div> <div>SEV</div> <div>Information </div> </div> <div> <div>SEV</div> <div>Low </div> </div> <div> <div>SEV</div> <div>Medium </div> </div> <div> <div>SEV</div> <div>High </div> </div> <div> <div>SEV</div> <div>Critical </div> </div>	vlan300		0

5. Configure a firewall policy to limit access for devices in this VLAN (vlan300).

To configure virtual patching on NAC policies in the CLI:

1. Configure the VLAN in the MAC policy:

```
config switch-controller mac-policy
  edit "IoT"
    set fortilink "fortilink"
    set vlan "vlan300"
  next
end
```

2. Configure the NAC policy:

```
config user nac-policy
  edit "IoT"
    set category vulnerability
    set severity 0 1 2 3 4
    set switch-fortilink "fortilink"
    set switch-mac-policy "IoT"
  next
end
```

3. Enable NAC mode on the desired FortiSwitch ports:

```
config switch-controller managed-switch
  edit "S248E*****"
    config ports
      edit "port6"
        set access-mode nac
      next
    end
  next
end
```

4. Configure a firewall policy to limit access for devices in this VLAN (vlan300).

SSL & SSH Inspection

Secure Sockets Layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- *certificate-inspection*
- *deep-inspection*
- *no-inspection*

The *custom-deep-inspection* profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- [Configuring an SSL/SSH inspection profile on page 1720](#)
- [Certificate inspection on page 1723](#)
- [Deep inspection on page 1724](#)
- [Protecting an SSL server on page 1727](#)
- [Handling SSL offloaded traffic from an external decryption device on page 1728](#)
- [SSH traffic file scanning on page 1730](#)
- [Redirect to WAD after handshake completion on page 1732](#)
- [HTTP/2 support in proxy mode SSL inspection on page 1733](#)
- [Define multiple certificates in an SSL profile in replace mode on page 1734](#)
- [Disabling the FortiGuard IP address rating on page 1736](#)

Configuring an SSL/SSH inspection profile

The *custom-deep-inspection* profile can be edited or new SSL/SSH inspection profiles can be configured to be used in firewall policies.

To configure an SSL/SSH inspection profile in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).

<i>SSL Inspection Options</i>	
<i>Enable SSL Inspection of</i>	<p>Enable SSL inspection of:</p> <ul style="list-style-type: none"> • <i>Multiple Clients Connecting to Multiple Servers</i>: Use this option for generic policies where the destination is unknown. This is normally used when inspecting outbound internet traffic. Other <i>SSL Inspection Options</i> become available to configure if this option is selected. • <i>Protecting SSL Server</i>: Use this option when setting up a profile customized for a specific SSL server with a specific certificate. Define the certificate using the <i>Server certificate</i> field. See Protecting an SSL server on page 1727 for more information.
<i>Inspection method</i>	<p>Define the inspection method:</p> <ul style="list-style-type: none"> • <i>SSL Certificate Inspection</i>: Only inspects the certificate, by way of the headers up to the SSL/TLS layer, and not the contents of the traffic. • <i>Full SSL Inspection</i>: Inspects the SSL/TLS encrypted traffic payload. See Deep inspection on page 1724.
<i>CA certificate</i>	Use the dropdown menu to select one of the installed certificates for the inspection of the packets. Click <i>Download</i> to save the certificate.
<i>Blocked certificates</i>	Block or allow potentially malicious certificates. Select <i>View Blocked Certificates</i> for a detailed list of blocked certificates, including the listing reason and date.
<i>Untrusted SSL certificates</i>	<p>Configure the action to take when a server certificate is not issued by a trusted CA.</p> <ul style="list-style-type: none"> • <i>Allow</i>: Allow the untrusted server certificate. This is the default value. • <i>Block</i>: Block the session. • <i>Ignore</i>: This option is for <i>Full SSL inspection</i> only. It re-signs the server certificate as trusted. When configured in the GUI for certificate inspection it has no effect and the setting is not saved. <p>Click <i>View Trusted CAs List</i> to see a list of the factory bundled and user imported CAs that are trusted by the FortiGate.</p>
<i>Server certificate SNI check</i>	<p>Check the SNI in the help message with the CN or SAN field in the returned server certificate:</p> <ul style="list-style-type: none"> • <i>Enable</i>: If it is mismatched, use the CN in the server certificate for URL filtering. • <i>Strict</i>: If it is mismatched, close the connection. • <i>Disable</i>: Server certificate SNI check is disabled.
<i>Enforce SSL cipher compliance</i>	Enable/disable SSL cipher compliance. This option is for <i>Full SSL inspection</i> only.
<i>Enforce SSL negotiation compliance</i>	Enable/disable SSL negotiation compliance. This option is for <i>Full SSL inspection</i> only.
<i>RPC over HTTPS</i>	Enable/disable inspection of Remote Procedure Calls (RPC) over HTTPS traffic. This option is for <i>Full SSL inspection</i> only.

Protocol Port Mapping

Inspect all ports with the IPS engine by enabling *Inspect all ports*.
If *Inspect all ports* is disabled, specify the port through which traffic will be inspected in the field next to the listed protocols. Traffic of that protocol going through any other port will not be inspected.

Exempt from SSL Inspection

These options are for *Full SSL inspection* only. Use the menus in this section to specify any reputable websites, FortiGuard Web Categories, or addresses that will be exempt from SSL inspection:

- **Reputable Websites:** Enable this option to exempt any websites identified by FortiGuard as reputable.
- **Web Categories:** The categories of *Finance and Banking*, *Health and Wellness*, and *Personal Privacy* have been added by default. These categories are the most likely to have applications that will require a specific certificate.
- **Addresses:** These can be any of the address objects that have an interface of *any*.
- **Log SSL exemptions:** Enable this option to log all SSL exemptions.

See [Exempt web sites from deep inspection on page 1726](#) for more information.

SSH Inspection Options**SSH deep scan**

Enable/disable SSH protocol packet deep scanning capabilities. *SSH port* will become available if *SSH deep scan* is enabled.

SSH port

Define what ports will search for SSH protocol packets:

- **Any:** Select this option to search all traffic regardless of service or TCP/IP port for packets that conform to the SSH protocol.
- **Specify:** Select this option and enter the port number to restrict the search for SSH protocol packets to the TCP/IP port number specified. This is not as comprehensive but it is easier on the performance of the firewall.

Common Options**Invalid SSL certificates**

Allow or block the passing of traffic in invalid certificates. Additional common options that provide more granularity with actions for different types of invalid SSL certificates will become available if *Invalid SSL certificates* is set to *Custom*:

- **Expired certificates:** Action to take when the server certificate is expired. The default action is block.
- **Revoked certificates:** Action to take when the server certificate is revoked. The default action is block.
- **Validation timed-out certificates:** Action to take when the server certificate validation times out. For certificate inspection, the default action is allow. For deep inspection, the default action is Keep Untrusted & Allow.
- **Validation failed certificates:** Action to take when the server certificate validation fails. The default action is block.

For deep inspection, the above options have the following actions:

- **Keep Untrusted & Allow:** Allow the server certificate and keep it untrusted.
- **Block:** Block the certificate.

	<ul style="list-style-type: none"> • <i>Trust & Allow</i>: Allow the server certificate and re-sign it as trusted.
<i>Log SSL anomalies</i>	<p>Enable this feature to record and log traffic sessions containing invalid certificates.</p> <p>By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.</p>

3. Click OK.

Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in *certificate-inspection* profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.

If you do not want to deep scan for privacy reasons but you want to control web site access, you can use *certificate-inspection*.

When a firewall policy is in flow-based inspection mode, *SSL Certificate Inspection* does not validate the certificate. *Untrusted SSL certificates* and *Server Certificate SNI* checks are not performed. If these features are needed, use proxy-based inspection mode.

Inspect non-standard HTTPS ports

The built-in *certificate-inspection* profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the *HTTPS* field.

To add a port to the inspection profile in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection*.
2. Create a new profile, or clone the default profile.
3. If you do not know what port is used in the HTTPS web server, under *Protocol Port Mapping* enable *Inspect All Ports*.
If you know the port, such as port 8443, then set *HTTPS* to *443,8443*.

4. Configure the remaining setting as needed.
5. Click **OK**.

Common options

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types. See [Configuring an SSL/SSH inspection profile on page 1720](#).

When a firewall policy is in flow-based inspection mode, *SSL Certificate Inspection* does not validate the certificate. *Expired certificates* and *Revoked certificates* checks are not performed, and the *Validation timed-out certificates* and *Validation failed certificates* actions do not apply. If these features are needed, use proxy-based inspection mode.

Deep inspection

You can configure address and web category allowlists to bypass SSL deep inspection.

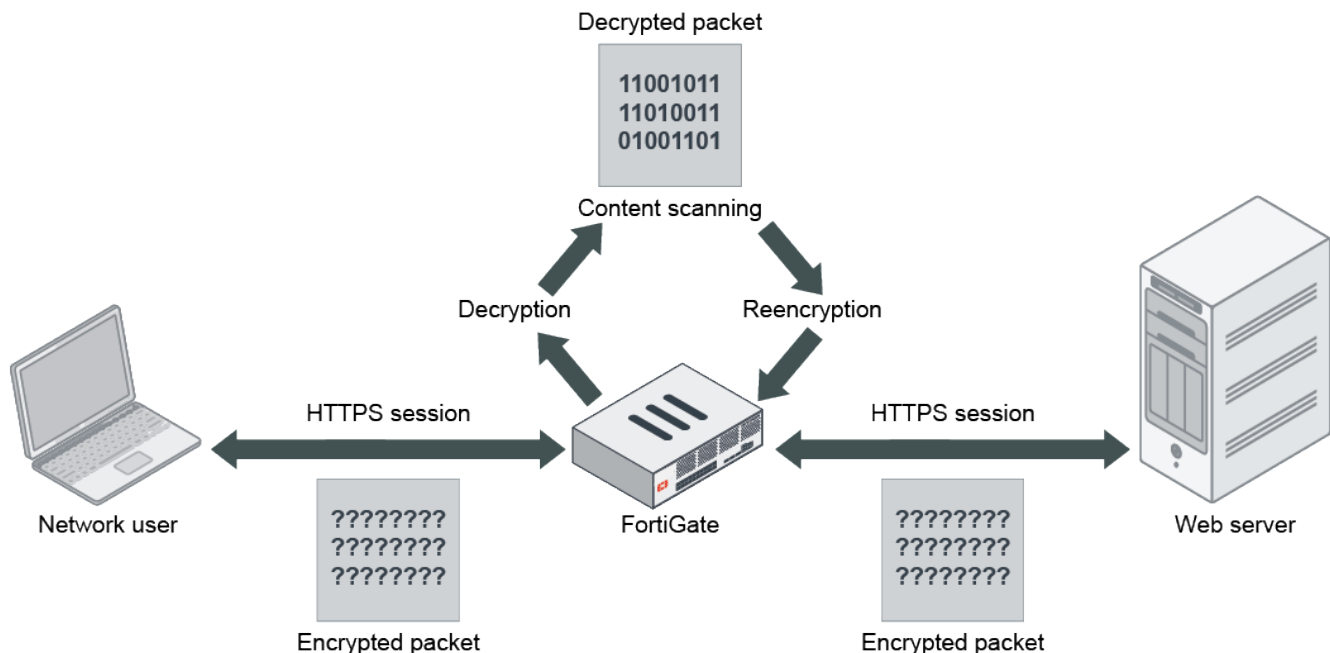

Reasons for using deep inspection

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.

For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network's security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.

Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTPS
- SMTPS
- POP3S
- IMAPS
- FTPS
- DNS over TLS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Browser messages when using deep inspection

When the FortiGate re-encrypts the content, it uses a stored certificate, such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

If you still get messages about untrusted certificates after importing *Fortinet_CA_SSL* into your browser, it is due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

To import *Fortinet_CA_SSL* into your browser:

1. On the FortiGate, go to *Security Profiles > SSL/SSH Inspection* and edit the *deep-inspection* profile.
The default *CA Certificate* is *Fortinet_CA_SSL*.
2. Click *Download* and save the certificate to the management computer.
3. On the client PC, use the *Certificate Import Wizard* to install the certificate into the *Trusted Root Certificate Authorities* store.
If a security warning appears, select *Yes* to install the certificate.

Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the *Finance and Banking* category, which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see [Web rating override on page 1748](#) and [Threat feeds on page 3099](#).

If you want to exempt commonly trusted web sites, you can bypass the SSL allowlist in the SSL/SSH profile by enabling *Reputable websites*. The allowlist includes common web sites trusted by FortiGuard.

SSL version support

There are two ways to limit which SSL versions deep inspection is applied to.

- In the global attributes:

```
config system global
    set strong-crypto enable
end
```

- In the protocol configuration of a deep inspection profile:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps}
            set min-allowed-ssl-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | tls-1.3}
        end
    next
end
```

Enabling `strong-crypto` in the global attributes sets the `min-allowed-ssl-version` to `tls-1.1` by default.

When a session is attempted using an SSL version below the minimum allowed version, the session can be blocked (default) or allowed.

To configure the action based on the SSL version used being unsupported:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps | imaps | pop3s | smtps | dot}
            set unsupported-ssl-version {allow | block}
        end
    next
end
```

Protecting an SSL server

You typically use the FortiGate *Protecting SSL Server* profile as an inbound policy for clients on the internet that access the server through the internal side of the FortiGate.

Protecting SSL Server uses a server certificate to protect a single server.

You can use *Protecting SSL Server* if you do not want a client on the internet to directly access your internal server, and you want the FortiGate to simulate your real server.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

1. Go to *System > Certificates*.
2. Select *Import > Local Certificate* and upload the certificate.
3. Go to *Security Profiles > SSL/SSH Inspection* and edit or create a new profile.
4. For *Enable SSL Inspection of*, select *Protecting SSL Server*.

5. For *Server Certificate*, click the + and select the local certificate you imported.

The screenshot shows the 'New SSL/SSH Inspection Profile' configuration window. The 'Name' field is 'Protecting server'. The 'Comments' field is 'Write a comment...'. The 'SSL Inspection Options' section has 'Enable SSL inspection of' set to 'Multiple Clients Connecting to Multiple Servers'. The 'Server certificate' dropdown shows a list of certificates, with 'test' selected. A 'Select Entries' dialog is open, showing a list of certificates including 'Fortinet_Factory', 'Fortinet_Factory_Backup', 'Fortinet_SSL', 'Fortinet_SSL_DSA1024', 'Fortinet_SSL_DSA2048', 'Fortinet_SSL_ECDSA256', 'Fortinet_SSL_ECDSA384', 'Fortinet_SSL_ECDSA521', 'Fortinet_SSL_ED25519', 'Fortinet_SSL_ED448', 'Fortinet_SSL_RSA1024', 'Fortinet_SSL_RSA2048', and 'test'. The 'test' certificate is highlighted in the 'Select Entries' dialog. The 'test' certificate is also listed in the main 'Server certificate' dropdown. The 'Protocol Port Mapping' section has 'Inspect all ports' set to 'Off' and 'HTTPS' set to 'On' with port '443'. The 'Exempt from SSL Inspection' section has 'Addresses' set to an empty list and 'Log SSL exemptions' set to 'Off'. The 'OK' and 'Cancel' buttons are at the bottom.

6. Click OK.

When you apply the *Protecting SSL Server* profile in a policy, the FortiGate will send the server certificate to the client as your server does.

Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in `firewall profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).

If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.

To configure SSL offloading:

```

config firewall profile-protocol-options
    edit "default-clone"
        config http
            set ports 80
            unset options
            unset post-lang
            set ssl-offloaded yes
        end
        config ftp
            set ports 21
            set options splice
            set ssl-offloaded yes
        end
        config imap
            set ports 143
            set options fragmail
            set ssl-offloaded yes
        end
        config pop3
            set ports 110
            set options fragmail
            set ssl-offloaded yes
        end
        config smtp
            set ports 25
            set options fragmail splice
            set ssl-offloaded yes
        end
    next
end

```

Verifying the packet captures

The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:

No.	Time	Source	Destination	Protocol	Length	Info
20	8.538335	10.1.100.66	172.16.200.99	TCP	74	49818 → 443 [SYN] Seq=0 Win=64240 Len=0 MSS=1460 SACK_PERM=1 TSval=2672317962 TSecr=0 WS=128

SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP profile
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
  edit <name>
    config ssh
      set options {oversize clientcomfort servercomfort}
      set comfort-interval <1 - 900>
      set comfort-amount <1 - 65535>
      set oversize-limit <1 - 798>
      set uncompressed-oversize-limit <0 - 798>
      set uncompressed-nest-limit <2 - 100>
      set scan-bzip2 {enable | disable}
    end
  next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
  edit <name>
    set block scp
    set log scp
  next
end
```

To configure the DLP profile:

```
config dlp profile
  edit <name>
    set full-archive-proto ssh
    set summary-proto ssh
    config filter
      edit 1
        set proto ssh
      next
    end
  next
end
```

To configure the antivirus profile options:

```
config antivirus profile
  edit <name>
    config ssh
      set av-scan {disable | block | monitor}
      set outbreak-prevention {disable | block | monitor}
      set external-blocklist {disable | block | monitor}
      set fortindr {disable | block | monitor}
      set quarantine {enable | disable}
```

```
        set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb timeout unhandled}
        set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb timeout unhandled}
        set emulator {enable | disable}
    end
next
end
```

To configure the antivirus quarantine options:

```
config antivirus quarantine
    set drop-infected ssh
    set store-infected ssh
    set drop-blocked ssh
    set store-blocked ssh
    set drop-machine-learning ssh
    set store-machine-learning ssh
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP three-way handshake can be established with the client even though the server did not complete the handshake.

This option uses IPS to handle the initial TCP three-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```
config firewall ssl-ssh-profile
    edit "test"
        config https
            set ports 443
            set status certificate-inspection
            set proxy-after-tcp-handshake enable
        end
    next
end
```

To enable proxy after a TCP handshake in protocol options:

```
config firewall profile-protocol-options
    edit "test"
        config http
            set ports 80
            set proxy-after-tcp-handshake enable
            unset options
            unset post-lang
        end
    next
end
```

HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.

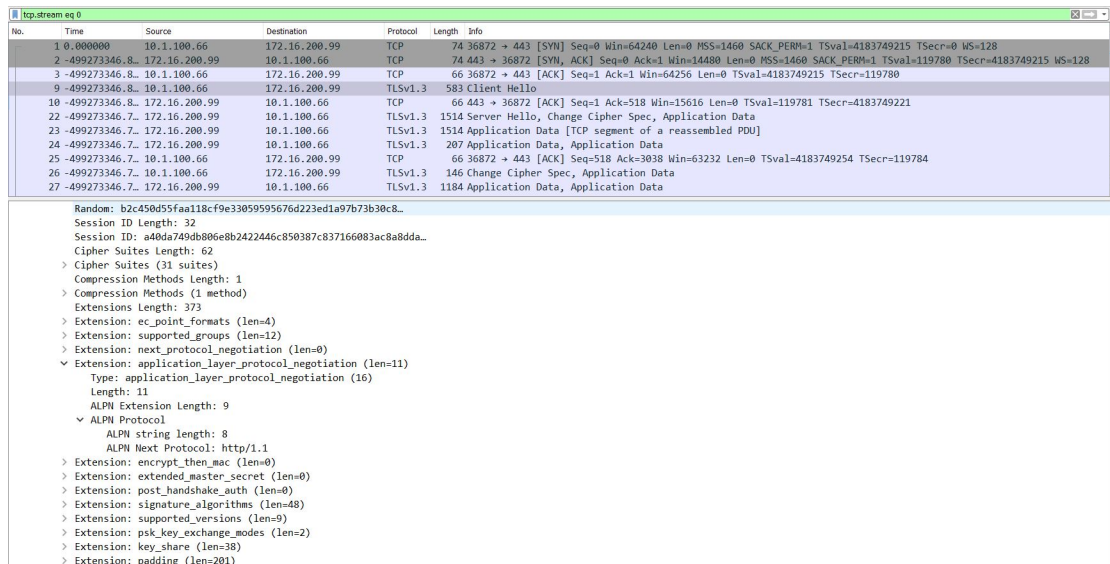

To set the ALPN support:

```
config firewall ssl-ssh-profile
  edit <profile>
    set supported-alpn {all | http1-1 | http2 | none}
  next
end
```

all	The FortiGate forwards all ALPN extensions, except SPDY. This is the default value.
http1-1	The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
http2	The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
none	The FortiGate always strips the ALPN header from the Client Hello when forwarding.

For example, if `supported-alpn` is set to `http2`, but the extension uses HTTP/1.1 or SPDY, the ALPN header is stripped from the Client Hello:

- Incoming packet capture:

- Outgoing packet capture:

No.	Time	Source	Destination	Protocol	Length	Info

Define multiple certificates in an SSL profile in replace mode

Multiple certificates can be defined in an SSL inspection profile in replace mode (*Protecting SSL Server*). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.

Example

To configure an SSL profile in replace mode with multiple certificates:

```

config firewall ssl-ssh-profile
  edit "multi-cert"
    set server-cert-mode replace
  
```

```

        set server-cert "bbb" "aaa"
    next
end

```

To configure a policy that uses the SSL profile:

```

config firewall policy
    edit 1
        set name "multi-cert"
        set srcintf "port6"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "multi-cert"
        set av-profile "default"
        set webfilter-profile "default"
        set logtraffic all
        set nat enable
    next
end

```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses *www.aaa.com*, the FortiGate will use the *aaa* certificate as a replacement.

If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses *www.ccc.com*, because there is no certificate for *www.ccc.com*, the FortiGate will use the *bbb* certificate as a replacement.

Disabling the FortiGuard IP address rating

The FortiGuard IP address rating for SSL exemptions and proxy addresses can be disabled using the `ssl-exemption-ip-rating` and `address-ip-rating` options.

To disable using the FortiGuard IP address rating for SSL exemptions:

```
config firewall ssl-ssh-profile
  edit <name>
    set ssl-exemption-ip-rating {enable | disable}
  next
end
```

To disable using the FortiGuard IP address rating for proxy addresses:

```
config firewall profile-protocol-options
  edit <name>
    config http
      set address-ip-rating {enable | disable}
    end
  next
end
```

The `ssl-exemption-ip-rating` and `address-ip-rating` options are enabled by default, so when both a website domain and its IP address return different categories after being rated by FortiGuard, the IP address category takes precedence when evaluating SSL exemptions associated with the SSL inspection profile and proxy addresses associated with the proxy protocol options profile. SSL exemptions and the `ssl-exemption-ip-rating` option work in both inspection modes (proxy and flow).

When the categories associated with the website domain and IP address are different, disabling the FortiGuard IP rating ensures that the FortiGuard domain category takes precedence when evaluating the preceding objects. For most websites, the domain category is valid when its IP address is unrated by FortiGuard. Since being unrated is considered as not having a category, the FortiGate uses the domain category as the website category.

A website might have an IP category that differs from its domain category. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. The rating weight is hard-coded in the FortiGate and depending on the relative category weights, the FortiGate may use the IP category instead of the website category. If the `ssl-exemption-ip-rating` option is disabled in the SSL inspection profile, then the FortiGate uses the domain category as the website category, which ensures SSL exemption operation as intended.

The `address-ip-rating` option in a proxy protocol options profile functions the same way as the `ssl-exemption-ip-rating` option. If the `address-ip-rating` option is disabled in a profile that is used in an explicit proxy policy that also uses a web filter profile, for HTTP or HTTPS traffic to a website that has different IP and domain categories and that matches the policy, the FortiGate will use the domain category when it evaluates categories for the web filter.

Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- Application group
- Application signature
- IPS signature

The following topic provides information about custom signatures:

- [Configuring custom signatures on page 1737](#)
- [Blocking applications with custom signatures on page 1739](#)
- [Filters for application control groups on page 1741](#)
- [Application groups in traffic shaping policies on page 1744](#)

Configuring custom signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. See [Intrusion prevention on page 1589](#) for more information.

An IPS signature identifies characteristics of a packet that are unique to an attack, such as the protocol type, an option/value pair within the payload, other special aspects of the payload, or specific application options. Custom IPS signatures can be created to block, monitor, or quarantine specific traffic that is not covered by the IPS definitions list. To view the IPS definitions list:

- Go to *Security Profiles > IPS Signatures*.
- Go to *Security Profiles > Intrusion Prevention*, edit an existing IPS sensor, and click *View IPS Signatures* in the right-hand pane.
- Go to *System > FortiGuard*, in the *License Information* table expand *Intrusion Prevention*, and in the *IPS Definitions* row click *Actions > View List*.

```
1  /**
2  * Make a new directory, or clear and prepare an existing directory.
3  *
4  * CAUTION
```

```

5 | If the directory happens to be set to the current directory, where
6 | * this script lives, then it can wipe out the script code.
7 | */
8 | function MakeDir($directory)
9 | {
10 |     //If the directory exists, make sure it is empty
11 |     if (is_dir($directory)) {
12 |         rmdir($directory);
13 |     }
14 |     mkdir($directory) or die(print_r(error_get_last(),true));
15 |
16 |     return $directory . "/";
17 | }

```

An application signature identifies characteristics of a packet that is unique to an application. Custom application signatures can be used in application control profiles to block traffic from specific applications that are not covered by the application control signatures list. To view the application control signatures list:

- Go to *Security Profiles > Application Signatures* and select the *Signature* view.
- Go to *Security Profiles > Application Control*, edit an existing application sensor, and click *View Application Signatures* in the right-hand pane.
- Go to *System > FortiGuard*, in the *License Information* table expand *Firmware & General Updates*, and in the *Application Control Signatures* row click *Actions > View List*.

Application groups can be created by selecting individual application, or by filtering by application category. The groups can then be used in firewall policies.

For information about the syntax for building IPS and application control signatures, see the [Custom IPS and Application Control Signature Syntax Guide](#).

To make the application signatures settings visible in the GUI:

1. Go to *System > Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To configure custom signatures:

1. Custom application and IPS signatures can be configured:
 - To configure custom application signatures, go to *Security Profiles > Application Signatures* and click *Create New > Custom Application Signature*. See [Blocking applications with custom signatures on page 1739](#) for an example.
 - To configure custom IPS signatures, go to *Security Profiles > IPS Signatures* and click *Create New*.

2. Configure the following settings:

<i>Name</i>	Enter a unique name for the signature.
<i>Comments</i>	Enter a comment (optional).
<i>Signature</i>	Enter the signature.

3. Click **OK**.

To configure application groups:

1. Go to *Security Profiles > Application Signatures* and click *Create New > Application Group*.
2. Configure the following settings:

<i>Group Name</i>	Enter a unique name for the signature group.
<i>Type</i>	Set the application group type, either application ID or application filter. See Filters for application control groups on page 1741 for information about the available filters.
<i>Members</i>	Select the applications or filter to include in the group.
<i>Comments</i>	Enter a comment (optional).

3. Click **OK**.
See [Application groups in traffic shaping policies on page 1744](#) for more information.

Blocking applications with custom signatures

Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.

In this example, a custom signature is created to detect PCs running Windows NT 6.1 operating systems, including Windows 7 and Windows Server 2008 R2. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that need to be blocked.

To create the custom application signature:

1. Go to *Security Profiles > Application Signatures* and click *Create New > Custom Application Signature*.
2. Enter a name for the custom signature, such as *block_nt_6.1*.
3. Enter the *Signature*. In this example:

```
F-SBID( --attack_id 6483; --name "Windows.NT.6.1.Web.Surfing"; --default_action drop_session; --service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern !"FCT"; --pattern "Windows NT 6.1"; --no_case; --context header; --weight 40; )
```

This signature scans HTTP and HTTPS traffic that matches the pattern *Windows NT 6.1* in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern *Windows NT 5.1*. An attack ID is automatically generated when the signature is created.

New Application Signature

Name:

Comments: 0/63

Signature

```
F-SBID[ --name "Windows.NT.6.1.Web.Surfing"; --default_action drop_session; --service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern "!FCT"; --pattern "Windows NT 6.1"; --no_case; --context_header; --weight 40; ]
```

4. Click **OK**.

The signature is included in the *Custom Application Signature* section of the signature list.

To use the signature in an application control profile:

- Go to *Security Profiles > Application Control*.
- Create a new profile, or edit an existing one.
- In the *Application and Filter Overrides* table, click *Create New*.
- Set *Type* to *Application* and *Action* to *Block*.
- Select the custom signature from the list, using the search feature if required, then click *Add Selected*.

Edit Application

Add New Override

Type: ☐ Application ☐ Filter

Action: ☒ Block

Add All Results Remove Selected Search

Selected: All Cloud

Name	Category	Technology	Popularity	Risk
Custom Application Signature				
Windows.NT.6.1.Web.Surfing	Web.Client			
Application Signature (2,414)				
1kocun	Video/Audio	Client-Server	★★★★☆	★★★★
1und1.Mall	Email	Browser-Based	★★★★☆	★★★★

OK Cancel

6. Click **OK**.

The signature is added to the table.

7. Click **OK**.

To add the application control profile to a firewall policy:

- Go to *Policy & Objects > Firewall Policy*.
- Edit the policy that currently allows a connection from the internal network to the internet.
- In the *Security Profiles* section, enable *Application Control* and select the profile.

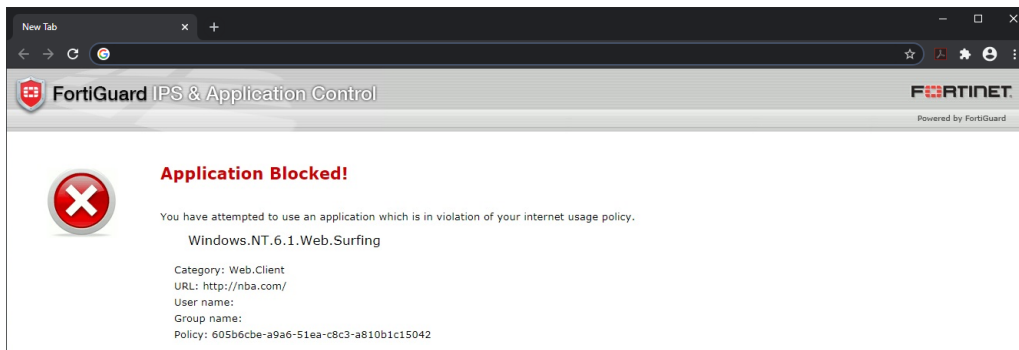

If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection

to a profile that includes deep inspection. See [SSL & SSH Inspection on page 1720](#) for more information.

4. Click *OK*.

Results

When a PC running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see [Replacement messages on page 2671](#).

Go to *Log & Report > Security Events* to view the web traffic that is logged for the PC that is blocked by the application signature in the *Application Control* card.

[illegible]

Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.

```

config application group
  edit <name>
    set type filter
    set protocols <integer>
    set risk <integer>
    set vendor <id>
    set technology <id>
    set behavior <id>
    set popularity <integer>
    set category <id>
  next
end

```

protocols <integer>	Application protocol filter (0 - 47, or all).
risk <integer>	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
vendor <id>	Application vendor filter (0 - 25, or all).
technology <id>	Application technology filter: <ul style="list-style-type: none"> • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
behavior <id>	Application behavior filter: <ul style="list-style-type: none"> • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
popularity <integer>	Application popularity filter (1 - 5, from least to most popular).
category <id>	Application category filter: <ul style="list-style-type: none"> • 2 (P2P) • 3 (VoIP) • 5 (video/audio) • 6 (proxy) • 7 (remote access) • 8 (game) • 12 (general interest) • 15 (network service) • 17 (update) • 21 (email) • 22 (storage backup) • 23 (social media) • 25 (web client)

- 26 (industrial)
- 28 (collaboration)
- 29 (business)
- 30 (cloud IT)
- 31 (mobile)
- 32 (unknown applications)

Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```
config application group
  edit "risk_1"
    set type filter
    set risk 1
  next
end
```

To configure the security policy:

```
config firewall security-policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set status enable
    set schedule "always"
    set enforce-default-app-port disable
    set service "ALL"
    set app-group risk_1
    set logtraffic all
  next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```
config application group
  edit "two"
    set type filter
    set category 5
    set technology 1
  next
end
```

To configure the security policy:

```
config firewall security-policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set status enable
    set schedule "always"
    set enforce-default-app-port disable
    set service "ALL"
    set app-group two
    set logtraffic all
  next
end
```

To configure the traffic shaping policy:

```
config firewall shaping-policy
  edit 1
    set ip-version 4
    set service "ALL"
    set app-group two
    set dstintf port1
    set traffic-shaper "max-100"
    set traffic-shaper-reverse "max-100"
    set srcaddr "all"
    set dstaddr "all"
  next
end
```

Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:

- Policy 1 is for traffic related to cloud applications and has high priority.
- Policy 2 is for other traffic and has low priority.

At least one firewall policy must have application control enabled for the applications to match any policy traffic.

To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
 - a. Go to *Security Profiles > Application Signatures*.
 - b. Click *Create New > Application Group*. The *New Application Group* page opens.
 - c. Enter a name for the group, and for *Type*, select *Application*.
 - d. Click the + to add the group the members.

New Application Group

Group Name: cloud app group

Type: Application Filter

- b. Click **OK**.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

```
config application group
edit "cloud app group"
set application 27210 36740 35944 43296 33048
next
end
```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

```
config firewall shaping-policy
edit 1
set name "For Cloud Traffic"
set service "ALL"
set app-category 30
```

```
        set app-group "cloud app group"
        set dstintf "port1"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "For Other Traffic"
        set service "ALL"
        set dstintf "port1"
        set traffic-shaper "low-priority"
        set traffic-shaper-reverse "low-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web overrides:

- [Web rating override on page 1748](#)
- [Using local and remote categories on page 1756](#)
- [Web profile override on page 1758](#)

Web rating override

Web rating overrides allow you to apply a category override to a URL. This overrides the original FortiGuard category for the URL with either a different FortiGuard category, a custom local category, or a threat feed remote category.

If a URL is in multiple active categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

Web rating override requires a FortiGuard license.

To create a FortiGuard category override:

1. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
2. Configure the following settings:

URL	Enter the URL to override.
Lookup rating	Select to view any current <i>Category</i> and <i>Sub-Category</i> ratings.
Comments	Enter a comment (optional).
Override to	
Category	Select a FortiGuard category, threat feed remote category, or a <i>Custom Category</i> .
Sub-Category	Select a sub-category to further define the rating. If <i>Custom Category</i> was selected for the <i>Category</i> , you can select from a list of categories you created.

3. Click **OK**.

To create a custom local category override:

1. Create a custom category :
 - a. Go to *Security Profiles > Web Rating Overrides*.
 - b. Click *Custom Categories*, then click *Create New*.
 - c. Configure the following settings:

Name	Enter a unique name for the category.
Status	Enable/disable the status of the category.

- d. Click **OK**.
2. Create a web rating override:
 - a. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.

- b. Configure the following settings:

<i>URL</i>	Enter the URL to override.
<i>Lookup rating</i>	Select to view any current <i>Category</i> and <i>Sub-Category</i> ratings.
<i>Comments</i>	Enter a comment (optional).
<i>Override to</i>	
<i>Category</i>	Select <i>Custom Category</i> .
<i>Sub-Category</i>	Select the custom category that was just created.

- c. Click *OK*.

To create a thread feed remote category override:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed. This will also be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden in this remote category.
5. Configure the remaining settings as needed, then click *OK*.

Sub-category actions

After configuring category override rules, an override category must be active in a web filter profile for it to take effect. Whether a category is active or not depends on the override method and action:

Override method	Active category actions	Inactive category actions
FortiGuard categories	Monitor, Block, Warning, or Authenticate	Allow
Local categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*
Remote categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*

*The *Disable* action is only available for local and remote categories by right clicking on the sub-category.

The *Allow* action in the GUI is different for FortiGuard categories compared to local and remote categories.

For local and remote categories, the *Allow* action in the GUI corresponds to the monitor action with logging disabled in the CLI:

```

config webfilter profile
  edit <profile>
    config ftgd-wf
      config filters
        edit 142
          set category 142
          set action monitor
          set log disable
        next
      end
    end
  next
end

```

For FortiGuard categories, the *Allow* action in the GUI corresponds to no entry in the CLI:

The *Internet Radio and TV* sub-category has ID number 75.

```

config webfilter profile
  edit <profile>
    config ftgd-wf
      config filters
        end
      end
    end
  next
end

```

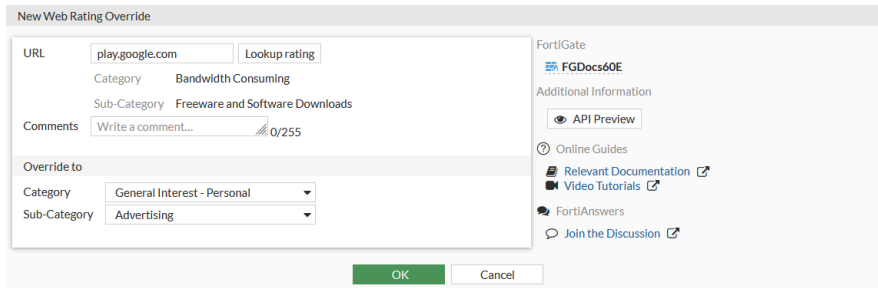

This means that a FortiGuard category with the *Allow* action applied is effectively inactive, as there is no actual action specified in the CLI.

Example 1: Override a FortiGuard category with another FortiGuard category

In this example, play.google.com is overridden from its original category, Freeware and Software Download (19), to the Advertising category (17). In the web filter profile, the Advertising category is set to *Block* and the Freeware and Software Download category is set to *Allow*.

To configure a FortiGuard web rating override:

1. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
2. Enter the URL: play.google.com.
3. Optionally, click *Lookup rating* to see what its current rating is.
4. Set the *Category* and *Sub-Category* to an existing category that is different from the original category.

5. Configure the remaining settings required, then click **OK**.

To apply the category in firewall policy:

1. Go to **Policy & Objects > Firewall Policy** and create or edit a policy.
2. Configure the policy fields as required.
3. Under **Security Profiles**, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.

5. Enable *Log Allowed Traffic*.
6. Click **OK**.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be blocked by the category override.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

You have tried to access a web page that is in violation of your Internet usage policy

Category Advertising

URL <https://play.google.com/>

To have the rating of this web page re-evaluated [please click here](#).

2. Go to **Log & Report > Security Events** and select **Web Filter**.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=16:43:31 eventtime=1663803811966781540 tz="-0700"
logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning"
vd="root" policyid=2 sessionid=891040 srcip=192.168.2.8 srcport=50318 srcintf="port2"
srcintfrole="undefined" dstip=142.251.211.238 dstport=443 dstintf="port1"
dstintfrole="undefined" proto=6 service="HTTPS" hostname="play.google.com" profile="FGD-
Override-FGD-Flow" action="blocked" reftype="direct" url="https://play.google.com/"
sentbyte=517 rcvbyte=0 direction="outgoing" msg="URL belongs to a denied category in
policy" method="domain" cat=17 catdesc="Advertising"
```

Example 2: Override a FortiGuard category with a remote category

In this example, play.google.com is added to an external URL category list and applied to a threat feed. In the web filter profile, the remote category is set to *Allow*, and the original FortiGuard category (Freeware and Software Download) is set to *Block*. Remote categories take precedence over FortiGuard categories, so the override action for the remote category will apply.

Delete the web rating override entry from example 1 for play.google.com before configuring this example.

To configure a FortiGuard threat feed for remote category override:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed, such as *Custom-Remote-FGD*. This will be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden to this remote category. This list will contain one entry for *play.google.com*.

The screenshot shows the 'New External Connector' configuration window. On the left, under 'Threat Feeds', 'FortiGuard Category' is selected. Below it, 'Connector Settings' are configured: 'Status' is 'Enabled', 'Name' is 'Custom-Remote-FGD', 'Update method' is 'External Feed', 'URL of external resource' is 'https://10.10.10.10/Override_URLs.txt', 'HTTP basic authentication' is 'Off', 'Refresh Rate' is '5 Minutes (1 - 43200)', and 'Comments' is '0/255'. On the right, 'Additional Information' includes links to 'API Preview', 'Public SDN Connector Setup Guides', 'Private SDN Connector Setup Guides', 'Online Guides', 'Relevant Documentation', 'Video Tutorials', 'FortiAnswers', and 'Join the Discussion'.

5. Configure the remaining settings as needed, then click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create or edit a web filter profile. See [FortiGuard filter on page 1482](#) for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Custom-Remote-FGD* category in the *Remote Categories* group to *Allow*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Block*.
5. Configure the remaining settings as required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to *play.google.com*. The page will be allowed by the remote category override.
2. No logs are recorded because the *Allow* action is selected.

Example 3 - Override a FortiGuard category with a custom local category

In this example, play.google.com is added to a custom local category. that is set to Monitor in the web filter profile. Local custom categories take precedence over both remote and FortiGuard categories, so the override action for the local category will apply.

To create a custom local category override:

1. Go to *Security Profiles > Web Rating Overrides*.
2. Click *Custom Categories*, then click *Create New*.
3. Enter a name for the category, such as *myCustomCategory*, and ensure the *Status* is set to *Enable*.
4. Click *OK*.

To create a web rating override for the custom local category:

1. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
2. Enter the URL to override.
3. For *Category*, select *Custom Categories* and for *Sub-Category* select *myCustomCategory*.

4. Click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create or edit a web filter profile. See [FortiGuard filter on page 1482](#) for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *myCustomCategory* category in the *LocalCategories* group to *Monitor*.
4. The other actions can be left as they were at the end of example 2, *Custom-Remote-FGD* set to *Allow* and *Freeware and Software Download* set to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the local category override.
2. Go to *Log & Report > Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=17:17:00 eventtime=1663805820486294353 tz="-0700"
logid="0317013312" type="utm" subtype="webfilter" eventtype="ftgd_allow" level="notice"
vd="root" policyid=2 sessionid=893147 srcip=192.168.2.8 srcport=50417 srcintf="port2"
srcintfrole="undefined" dstip=142.251.211.238 dstport=443 dstintf="port1"
dstintfrole="undefined" proto=6 service="HTTPS" hostname="play.google.com" profile="FGD-
Override-FGD-Flow" action="passthrough" reftype="direct" url="https://play.google.com/"
sentbyte=517 rcvbyte=0 direction="outgoing" msg="URL belongs to an allowed category in
policy" method="domain" cat=142 catdesc="myCustomCategory"
```

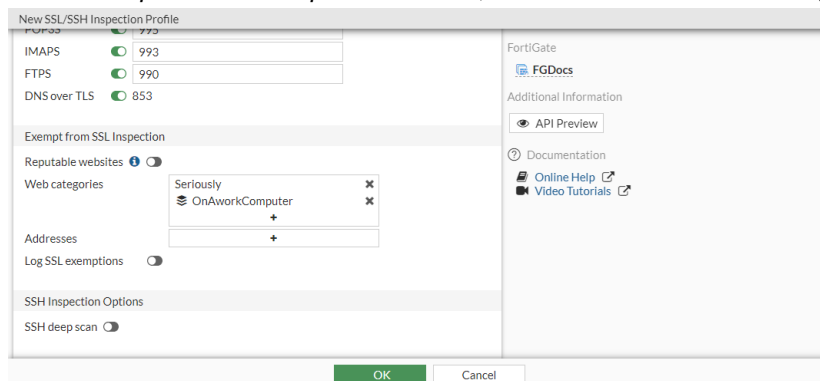

Using local and remote categories

For some functions, local and remote FortiGuard categories must be explicitly selected to apply. In [SSL/SSH inspection profiles](#), custom categories must be explicitly selected to be exempt from SSL inspection. In [Proxy addresses](#), custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

SSL/SSH inspection profiles

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection*.
2. Create a new profile or edit an existing one.
3. Ensure that *Inspection method* is *Full SSL Inspection*.
4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list .

5. Configure the remaining settings as required, then click **OK**.

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:

```
config vdom
  edit root
    config firewall ssl-ssh-profile
      edit "SSL_Inspection"
        config https
          set ports 443
          set status deep-inspection
        end
        ...
        config ssl-exempt
          edit 1
            set fortiguard-category 140
          next
          edit 2
            set fortiguard-category 192
          next
        end
      next
    end
  next
end
```

Proxy addresses

To use local and remote categories in a proxy address in the GUI:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*, or edit an existing proxy address.
2. Set *Category* to *Proxy Address*.
3. Set *Type* to *URL Category*.
4. In the *URL Category*, add the local and remote categories.

5. Configure the remaining settings as required, then click **OK**.

To use local and remote categories in a proxy address in the CLI:

```
config vdom
  edit root
    config firewall proxy-address
      edit "proxy_override"
        set type category
        set host "all"
        set category 140 192
        set color 23
      next
    end
  next
end
```

Web profile override

The following profile override methods are available:

- Administrative override
- Allow users to override blocked categories

Administrative override

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.

Scope range

You can choose one of the following scope ranges:

- User: authentication for permission to override is based on whether or not the user is using a specific user account.
- User group: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- Source IP: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.

When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

Configuring a web profile administrative override

This example describes how to override the *webfilter* profile with the *webfilter_new* profile.

To configure web profile administrative override using the GUI:

1. Go to *Security Profiles > Web Profile Overrides* and click *Create New*.
2. Configure the administrative override:
 - a. For *Scope Range*, click *Source IP*.
 - b. In the *Source IP* field, enter the IP address for the client computer (*10.1.100.11* in this example).
 - c. In the *Original profile* dropdown, select *webfilter*.
 - d. In the *New profile* dropdown, select *webfilter_new*.

In the *Expires* field, the default 15 minutes appears, which is the desired duration for this example.

3. Click *OK*.

To configure web profile administrative override using the CLI:

```
config webfilter override
edit 1
    set status enable
    set scope ip
    set old-profile "webfilter"
    set new-profile "webfilter_new"
    set expires 2021/07/30 10:14:00
    set initiator "admin"
    set ip 10.1.100.11
next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original

profile. With the *Allow users to override blocked categories* setting, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:

FortiGuard Intrusion Prevention - Access Blocked

Web Filter Block Override

If you have been granted creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked webpage. If you do not have these privileges, please contact your administrator to gain access to the webpage.

Only user-based overrides are allowed and you do not appear to be authenticated with the system. Please contact your administrator.

When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the `local_user` group. Once user1 successfully overrides, this will generate an override entry for the `local_user` group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.

Other features

Besides the scope, there are some other features in *Allow users to override blocked categories*.

Apply to user groups

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options are:

- *Predefined*: the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- *Ask*: the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

Creating a web profile users override

This example describes how to allow users in the `local_group` to override the `webfilter_new` profile.

To allow users to override blocked categories using the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*.
2. Enter a name for the profile.
3. Enable *Allow users to override blocked categories*.

4. Configure the web filter profile:

- a. Click the *Groups that can override* field, and select a group (*local_group* in this example).
- b. Click the *Profile Name* field, and select the *webfilter_new* profile.
- c. For the *Switch applies to* field, click *IP*.
- d. For the *Switch Duration* field, click *Predefined*. The default 15 minutes appears, which is the desired duration for this example.
- e. Configure the rest of the profile as needed.

5. Click OK.

Using the ask feature

This option is only available in *Allow users to override blocked categories* is enabled. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out and not editable. In the following example, the *Scope* is predefined with *IP*.

Web Filter Block Override

If you have been granted override creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked web-page. If you do not have these privileges, please contact your administrator to gain access to the web-page.

When the ask option is enabled (through the *Switch applies to* field in the GUI), the *Scope* dropdown is editable. Users can choose one of the following:

- User
- User group
- IP

Web Filter Block Override

If you have been granted override creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked web-page. If you do not have these privileges, please contact your administrator to gain access to the web-page.

Username:

Password:

Scope:

New Profile:

Duration: (Minutes)

User and *User Group* are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes *User* and *User Group*; otherwise, only the IP option will be available.

Profile groups

Security profiles can be organized into groups. They are useful when there are multiple policies that use the same security profiles, helping save time and preventing missing profiles when configuring policies. When changes need to be made, only the group has to be changed and not the individual policies.

By default, *Security Profiles > Profile Groups* is not visible in the GUI. It can only be enabled using the CLI.

To show profile groups in the GUI:

```
config system settings
    set gui-security-profile-group enable
end
```

To configure a profile group in the GUI:

1. Go to *Security Profiles > Profile Groups* and click *Create New*.

2. Enter a name for the group.
3. Enable the required profile types and select the profile that will be included in the group.
A *Protocol Option* must be selected.
4. Click *OK*.

To configure a profile group in the CLI:

```

config firewall profile-group
  edit <name>
    set application-list <string>
    set av-profile <string>
    set cifs-profile <string>
    set dlp-profile <string>
    set dnsfilter-profile <string>
    set emailfilter-profile <string>
    set file-filter-profile <string>
    set icap-profile <string>
    set ips-sensor <string>
    set profile-protocol-options <string>
    set sctp-filter-profile <string>
    set ssh-filter-profile <string>
    set ssl-ssh-profile <string>
    set videofilter-profile <string>
    set voip-profile <string>
    set waf-profile <string>
    set webfilter-profile <string>
  next
end

```

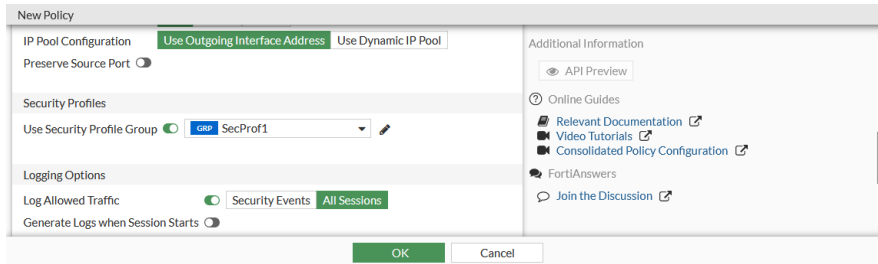

application-list <string>	Name of an existing application list.
av-profile <string>	Name of an existing antivirus profile.
cifs-profile <string>	Name of an existing CIFS profile.
dlp-profile <string>	Name of an existing DLP profile.
dnsfilter-profile <string>	Name of an existing DNS filter profile.
emailfilter-profile <string>	Name of an existing email filter profile.
file-filter-profile <string>	Name of an existing file-filter profile.
icap-profile <string>	Name of an existing ICAP profile.
ips-sensor <string>	Name of an existing IPS sensor profile.
profile-protocol-options <string>	Name of an existing protocol options profile (default = default).
sctp-filter-profile <string>	Name of an existing SCTP filter profile.
ssh-filter-profile <string>	Name of an existing SSH filter profile.
ssl-ssh-profile <string>	Name of an existing SSL SSH profile (default = certificate-inspection).
videofilter-profile <string>	Name of an existing video filter profile.
voip-profile <string>	Name of an existing VOIP profile.

waf-profile <string>	Name of an existing WAF profile.
webfilter-profile <string>	Name of an existing web filter profile.

To use the profile group in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
2. In the *Security Profiles* section, enable *Use Security Profile Group* and select a group.

No individual profiles can be selected if using a profile group.

3. Click **OK**.

To use the profile group in a policy in the CLI:

```
config firewall policy
  edit <policyid>
    set name <string>
    set srcintf <interface(s)>
    set dstintf <interface(s)>
    set action {accept | deny | ipsec}
    set srcaddr <address(es)>
    set dstaddr <address(es)>
    set schedule <schedule>
    set service <service(s)>
    set utm-status enable
    set profile-type group
    set profile-group <group>
  next
end
```

VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the Internet.

Instead of remotely logging into a private network using an unencrypted and unsecured Internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

Fortinet offers VPN capabilities in the FortiGate Unified Threat Management (UTM) appliance and in the FortiClient Endpoint Security suite of applications. You can install a FortiGate unit on a private network and install FortiClient software on the user's computer. You can also use a FortiGate unit to connect to the private network instead of using FortiClient software.

The following sections provide information about VPN:

- [IPsec VPNs on page 1765](#)
- [SSL VPN on page 2044](#)

IPsec VPNs

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 7.4.1.

- [Other VPN topics on page 1987](#)
- [VPN IPsec troubleshooting on page 2036](#)

General IPsec VPN configuration

The following sections provide instructions on general IPsec VPN configurations:

- [Network topologies on page 1766](#)
- [Phase 1 configuration on page 1766](#)
- [Phase 2 configuration on page 1780](#)
- [VPN security policies on page 1784](#)
- [Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 1787](#)
- [Configurable IKE port on page 1789](#)
- [IPsec VPN IP address assignments on page 1791](#)

Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

Topology	Description
Site-to-Site	Standard one-to-one VPN between two FortiGates. See Site-to-site VPN on page 1794 .
Hub and spoke/ADVPN	One central FortiGate (hub) has multiple VPNs to other remote FortiGates (spokes). In ADVPN, shortcuts can be created between spokes for direct communication. See ADVPN on page 1933 .
FortiClient dialup	Typically remote FortiClient dialup clients use dynamic IP addresses through NAT devices. The FortiGate acts as a dialup server allowing dialup VPN connections from multiple sources. See FortiClient as dialup client on page 1854 .
FortiGate dialup	Similar to site-to-site except one end is a dialup server and the other end is a dialup client. This facilitates scenarios in which the remote dialup end has a dynamic address, or does not have a public IP, possibly because it is behind NAT. See FortiGate as dialup client on page 1848 .
Aggregate VPN	Natively support aggregating multiple VPN tunnels to increase performance and provide redundancy over multiple links. See Packet distribution and redundancy for aggregate IPsec tunnels on page 1906 .
Redundant VPN	Options for supporting redundant and partially redundant IPsec VPNs, using route-based approaches. See Redundant hub and spoke VPN on page 1928 .
L2TP over IPsec	Configure VPN for Microsoft Windows dialup clients using the built in L2TP software. Users do not have to install any Fortinet software. See L2TP over IPsec on page 1872 .
GRE over IPsec	Legacy support for routers requiring point-to-point GRE over IPsec for tunneling. See GRE over IPsec on page 1811 .

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end is the FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The `auto-negotiate` and `negotiation-timeout` commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.

IPsec tunnels can be configured in the GUI using the *VPN Creation Wizard*. Go to *VPN > IPsec Wizard*. The wizard includes several templates (site-to-site, hub and spoke, remote access), but a custom tunnel can be configured with the following settings.

The IPsec phase 1 interface type cannot be changed after it is configured. This is due to the tunnel ID parameter (`tun_id`), which is used to match routes to IPsec tunnels to forward traffic. If the IPsec phase 1 interface type needs to be changed, a new interface must be configured.

Name	<p>Phase 1 definition name.</p> <p>The maximum length is 15 characters for an interface mode VPN and 35 characters for a policy-based VPN.</p> <p>For a policy-based VPN, the name normally reflects where the remote connection originates. For a route-based tunnel, the FortiGate also uses the name for the virtual IPsec interface that it creates automatically.</p>
Network	
IP Version	Protocol, either IPv4 or IPv6.
Remote Gateway	<p>Category of the remote connection:</p> <ul style="list-style-type: none"> • <i>Static IP Address</i>: the remote peer has a static IP address. • <i>Dialup User</i>: one or more FortiClient or FortiGate dialup clients with dynamic IP addresses will connect to the FortiGate. • <i>Dynamic DNS</i>: a remote peer that has a domain name and subscribes to a dynamic DNS service will connect to the FortiGate.
IP Address	The IP address of the remote peer. This option is only available when the <i>Remote Gateway</i> is <i>Static IP Address</i> .
Dynamic DNS	The domain name of the remote peer. This option is only available when the <i>Remote Gateway</i> is <i>Dynamic DNS</i> .
Interface	<p>The interface through which remote peers or dialup clients connect to the FortiGate. This option is only available in NAT mode.</p> <p>By default, the local VPN gateway IP address is the IP address of the interface that was selected (<i>Primary IP</i> in the <i>Local Gateway</i> field).</p>
Local Gateway	<p>IP address for the local end of the VPN tunnel (<i>Primary IP</i> is used by default):</p> <ul style="list-style-type: none"> • <i>Secondary IP</i>: secondary address of the interface selected in the <i>Interface</i> field. • <i>Specify</i>: manually enter an address. <p>Interface mode cannot be configured in a transparent mode VDOM.</p>
Mode Config	<p>This option is only available when the <i>Remote Gateway</i> is <i>Dialup User</i>.</p> <p>Configure the client IP address range, subnet mask/prefix length, DNS server, and split tunnel capability to automate remote client addressing.</p>
NAT Traversal	This option is only available when the <i>Remote Gateway</i> is <i>Static IP Address</i> or <i>Dynamic DNS</i> .

ESP (encapsulating security payload), the protocol for encrypting data in the VPN session, uses IP protocol 50 by default. However, it does not use any port numbers so when traversing a NAT device, the packets cannot be demultiplexed. Enabling NAT traversal encapsulates the ESP packet inside a UDP packet, thereby adding a unique source port to the packet. This allows the NAT device to map the packets to the correct session.

- *Enable*: a NAT device exists between the local FortiGate and the VPN peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal.
- *Disable*: disable the NAT traversal setting.
- *Forced*: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.

Keepalive Frequency

Keepalive frequency setting. This option is only available when *NAT Traversal* is set to *Enable* or *Forced*. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long.

The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device.

The keepalive packet is a 138-byte ISAKMP exchange.

Dead Peer Detection

Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are:

- *Disable*: disable dead peer detection (DPD).
- *On Idle*: triggers DPD when IPsec is idle.
- *On Demand*: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK has been received, IKE will not send DPDs periodically.

Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes.

When *Dead Peer Detection* is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See [Dead peer detection on page 1773](#).

Forward Error Correction

Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.

Device creation	Advanced option. When enabled, a dynamic interface (network device) is created for each dialup tunnel.
Aggregate member	Advanced option. When enabled, the tunnel can be used as an aggregate member candidate.
Authentication	
Method	Either <i>Pre-shared Key</i> or <i>Signature</i> .
Pre-shared Key	The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See Pre-shared key .
Certificate Name	The server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See Digital certificates .
IKE Version	Either 1 or 2. See Choosing IKE version 1 and 2 on page 1774 .
Mode	<p>This option is only available when IKEv1 is selected. The two available options are:</p> <ul style="list-style-type: none"> <i>Aggressive</i>: the phase 1 parameters are exchanged in a single message with unencrypted authentication information. <i>Main (ID protection)</i>: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information. <p>When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select <i>Aggressive</i> mode if there is more than one dialup phase 1 configuration for the interface IP address.</p> <p>When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select <i>Aggressive</i> mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals.</p>
Peer Options	Options to authenticate VPN peers or clients depending on the <i>Remote Gateway</i> and <i>Authentication Method</i> settings.
Any peer ID	<p>Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). <i>Mode</i> can be set to <i>Aggressive</i> or <i>Main</i>.</p> <p>This option can be used with digital certificate authentication, but for higher security, use <i>Peer certificate</i>.</p>
Specific peer ID	<p>This option is only available when <i>Aggressive Mode</i> is enabled. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer's administrator.</p> <p>If the remote peer is a FortiGate, the identifier is specified in the <i>Local ID</i> field of the <i>Phase 1 Proposal</i> settings.</p> <p>If the remote peer is a FortiClient user, the identifier is specified in the <i>Local ID</i> field.</p> <p>In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set.</p>

Peer certificate	<p>Define the CA certificate used to authenticate the remote peer when the authentication mode is <i>Signature</i>.</p> <p>If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the <i>Local ID</i> to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.</p>
Peer ID from dialup group	<p>Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel.</p> <p>You must create a dialup user group for authentication purposes. Select the group from the list next to the <i>Peer ID from dialup group</i> option.</p> <p>You must set <i>Mode</i> to <i>Aggressive</i> when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set <i>Mode</i> to <i>Main</i> if there is only one dialup Phase 1 configuration for this interface IP address.</p>
Phase 1 Proposal	<p>The encryption and authentication algorithms used to generate keys for the IKE SA.</p> <p>There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.</p>
Encryption	<p>The following symmetric-key encryption algorithms are available:</p> <ul style="list-style-type: none"> • <i>DES</i>: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. • <i>3DES</i>: triple-DES; plain text is encrypted three times by three keys. • <i>AES128</i>: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • <i>AES128GCM</i>: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • <i>AES192</i>: a 128-bit block algorithm that uses a 192-bit key. • <i>AES256</i>: a 128-bit block algorithm that uses a 256-bit key. • <i>AES256GCM</i>: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • <i>CHACHA20POLY1305</i>: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also HMAC settings.
Authentication	<p>The following message digests that check the message authenticity during an encrypted session are available:</p> <ul style="list-style-type: none"> • <i>MD5</i>: message digest 5. • <i>SHA1</i>: secure hash algorithm 1; a 160-bit message digest. • <i>SHA256</i>: a 256-bit message digest. • <i>SHA384</i>: a 384-bit message digest. • <i>SHA512</i>: a 512-bit message digest.

	In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (<i>PRFSHA1</i> , <i>PRFSHA256</i> , <i>PRFSHA384</i> , <i>PRFSHA512</i>). See also HMAC settings .
Diffie-Hellman Groups	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the <i>Diffie-Hellman Groups</i> (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.
Key Lifetime	The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172 800 seconds.
Local ID	Optional setting. This value must match the peer ID value given for the remote VPN peer's <i>Peer Options</i> . <ul style="list-style-type: none"> If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange. If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes.
XAUTH	This option supports the authentication of dialup clients. It is only available for IKE version 1. <ul style="list-style-type: none"> <i>Disable</i>: do not use XAuth. <i>Client</i>: available only if the <i>Remote Gateway</i> is set to <i>Static IP Address</i> or <i>Dynamic DNS</i>. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server. <i>PAP Server</i>, <i>CHAP Server</i>, <i>Auto Server</i>: available only if <i>Remote Gateway</i> is set to <i>Dialup User</i>. Dialup clients authenticate as members of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. <p>The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server.</p> <p>Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (<i>Inherit from policy</i> or <i>Choose</i>). See Using XAuth authentication on page 1778.</p>
Username	User name used for authentication.
Password	Password used for authentication.

Additional CLI configurations

The following phase 1 settings can be configured in the CLI:

VXLAN over IPsec

Packets with a VXLAN header are encapsulated within IPsec tunnel mode.

To configure VXLAN over IPsec:

```
config vpn ipsec phase1-interface/phase1
    edit ipsec
        set interface <name>
        set encapsulation vxlan/gre
        set encapsulation-address ike/ipv4/ipv6
        set encap-local-gw4 xxx.xxx.xxx.xxx
        set encap-remote-gw xxx.xxx.xxx.xxx
    next
end
```

IPsec tunnel idle timer

Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed.

To configure IPsec tunnel idle timeout:

```
config vpn ipsec phase1-interface
    edit p1
        set idle-timeout [enable | disable]
        set idle-timeoutinterval <integer> IPsec tunnel idle
        timeout in minutes (10 - 43200).
    next
end
```

Monitor tunnel for failover

Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface.

To configure the monitor:

```
config vpn ipsec phase1-interface
    edit <secondary phase1-interface>
        set monitor <primary phase1-interface>
    next
end
```

Passive mode

Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate.

To configure passive mode:

```
config vpn ipsec phase1-interface
    edit <example>
        set rekey {enable | disable}
        set passive-mode {enable | disable}
        set passive-tunnel-interface {enable | disable}
```

```

        next
    end

```

Network ID

The network ID is a Fortinet-proprietary attribute that is used to select the correct phase 1 between IPsec peers, so that multiple IKEv2 tunnels can be established between the same local/remote gateway pairs.

In a dial-up VPN, `network-id` is in the first initiator message of an IKEv2 phase 1 negotiation. The responder (Hub) uses the `network-id` to match a phase 1 configuration with a matching `network-id`. The Hub can then differentiate multiple dial-up phase 1s that are bound to the same underlay interface and IP address. Without a `network-id`, the Hub cannot have multiple phase 1 dialup tunnels on the same interface.

In static phase 1 configurations, `network-id` is used with the pair of gateway IPs to negotiate the correct tunnel with a matching `network-id`. This allows IPsec peers to use the same pair of underlay IPs to establish multiple IPsec tunnels. Without it, only a single tunnel can be established over the same pair of underlay IPs.

To configure the network ID:

```

config vpn ipsec phase1-interface
    edit <example>
        set ike-version 2
        set network-overlay enable
        set network-id <integer>
    next
end

```

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the *On Idle* option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```

config vpn ipsec phase1-interface
    edit <value>
        set dpd [disable | on-idle | on-demand]
        set dpd-retryinterval 15
    next
end

```

```

        set dpd-retrycount 3
    next
end

```

DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The `on-demand` option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as `3des-sha256`). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```

# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500

DPD sent/recv: 000001e1/00000000

```

Choosing IKE version 1 and 2

If you create a route-based VPN, you have the option of selecting IKE version 2. Otherwise, IKE version 1 is used.

IKEv2, defined in [RFC 4306](#), simplifies the negotiation process that creates the security association (SA).

If you select IKEv2:

- There is no choice in phase 1 of aggressive or main mode.
- Extended authentication (XAUTH) is not available.
- You can utilize EAP and MOBIKE.

Repeated authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to [RFC 4478](#). As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer".

To configure IKE SA re-authentication:

```
config vpn ipsec phase1-interface
    edit p1
        set reauth [enable | disable]
    next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in [RFC 6290](#).

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```
config system settings
    set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains `set fragmentation enable`.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.

By default, IKE fragmentation is enabled.

To configure IKEv1 fragmentation:

```
config vpn ipsec phase1-interface
    edit 1
        set fragmentation [enable | disable]
    next
end
```

IKEv2 fragmentation

[RFC 7383](#) requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

To configure IKEv2 fragmentation:

```
config vpn ipsec phase1-interface
    edit ike
        set ike-version 2
        set fragmentation [enable|disable]
        set fragmentation-mtu <500-16000>
    next
end
```

IPsec global IKE embryonic limit

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
    set embryonic-limit <integer>
end
```

<code>embryonic-limit <integer></code>	Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).
--	---

To configure an IKE embryonic limit of 50:

```
config system ike
    set embryonic-limit 50
end
```

Pre-shared key vs digital certificates

A FortiGate can authenticate itself to remote peers or dialup clients using either a pre-shared key or a digital certificate.

Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended authentication (XAuth). There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you authenticate the FortiGate using a pre-shared key, you can require remote peers or dialup clients to authenticate using peer IDs, but not client certificates.

To authenticate the FortiGate using a pre-shared key:

1. Go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	Pre-shared Key
Pre-shared Key	<string>
IKE Version	1 or 2
Mode	Aggressive or Main
Peer Options	Select an <i>Accept Type</i> and the corresponding peer. Options vary based on the <i>Remote Gateway</i> and <i>Authentication Method</i> settings in the <i>Network</i> section. <i>Peer Options</i> are only available in <i>Aggressive</i> mode.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See [Site-to-site VPN with digital certificate on page 1800](#) for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.

3. Configure or edit the *Authentication* settings as follows:

Method	Signature
Certificate Name	Select the certificate used to identify this FortiGate. If there are no imported certificates, use <i>Fortinet_Factory</i> .
IKE Version	1 or 2
Mode	<i>Aggressive</i> is recommended.
Peer Options	For <i>Accept Type</i> , select <i>Peer certificate</i> and select the peer and the CA certificate used to authenticate the peer. If the other end is using the Fortinet_Factory certificate, then use the <i>Fortinet_CA</i> certificate here.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Using XAuth authentication

Extended authentication (XAuth) increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

XAuth server

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user's credentials to an external RADIUS or LDAP server for verification.

If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select *PAP Server* whenever possible.
- You must select *PAP Server* for all implementations of LDAP and some implementations of Microsoft RADIUS.
- Select *Auto Server* when the authentication server supports *CHAP Server* but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use *Auto Server* to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

To configure XAuth to authenticate a dialup user group:

1. On the FortiGate dialup server, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.

3. In the *XAUTH* section, select the encryption method *Type* to use between the XAuth client, the FortiGate, and the authentication server.
4. For *User Group*:
 - a. Click *Inherit from policy* for multiple user groups defined in the IPsec/IKE policy, or
 - b. Click *Choose* and in the dropdown, select the user group that needs to access the private network behind the FortiGate.

Only one user group may be defined for *Auto Server*.

5. Click *OK*.
6. Create as many policies as needed, specifying the source user(s) and destination address.

XAuth client

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

To configure the FortiGate dialup client as an XAuth client:

1. On the FortiGate dialup client, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.
3. In the *XAUTH* section, for *Type*, select *Client*.
4. For *Username*, enter the FortiGate PAP, CHAP, RADIUS, or LDAP user name that the FortiGate XAuth server will compare to its records when the FortiGate XAuth client attempts to connect.
5. Enter the *Password* for the user name.
6. Click *OK*.

Dynamic IPsec route control

You can add a route to a peer destination selector by using the `add-route` option, which is available for all dynamic IPsec phases 1 and 2, for both policy-based and route-based IPsec VPNs.

The `add-route` option adds a route to the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the `distance` and `priority` options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable `add-route` in any policy-based or route-based phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, `add-route` can be enabled, disabled, or set to use the same route as phase 1.

The `add-route` option is enabled by default.

To configure add-route in phase 1:

```
config vpn ipsec
  edit <name>
    set type dynamic
    set add-route {enable | disable}
```

```

    next
end

```

To configure add-route in phase 2:

```

config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end

```

Blocking IPsec SA negotiation

For interface-based IPsec, IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base.

In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

Phase 2 configuration

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options are available in the *VPN Creation Wizard* after the tunnel is created:

New Phase 2	
Name	Phase 2 definition name.
Local Address	<p>A value of 0.0.0.0/0 means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address.</p> <p>See Quick mode selectors on page 1782.</p>
Remote Address	<p>Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of 0.0.0.0/0 means all IP addresses behind the remote VPN peer.</p> <p>See Quick mode selectors on page 1782.</p>
Advanced	Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.
Encryption	<p>The following symmetric-key encryption algorithms are available:</p> <ul style="list-style-type: none"> <i>NULL</i>: do not use an encryption algorithm. <i>DES</i>: Digital Encryption Standard, a 64-bit block algorithm that uses a

56-bit key.

- **3DES**: triple-DES; plain text is encrypted three times by three keys.
- **AES128**: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key.
- **AES128GCM**: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2.
- **AES192**: a 128-bit block algorithm that uses a 192-bit key.
- **AES256**: a 128-bit block algorithm that uses a 256-bit key.
- **AES256GCM**: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2.
- **CHACHA20POLY1305**: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2.

See [ChaCha20 and Poly1305 AEAD cipher on page 1784](#), [AES-GCM for IKEv2 phase 1 on page 1784](#), and [HMAC settings](#).

Authentication

The following message digests that check the message authenticity during an encrypted session are available:

- **NULL**: do not use a message digest.
- **MD5**: message digest 5.
- **SHA1**: secure hash algorithm 1; a 160-bit message digest.
- **SHA256**: a 256-bit message digest.
- **SHA384**: a 384-bit message digest.
- **SHA512**: a 512-bit message digest.

See also [HMAC settings](#).

Enable Replay Detection

Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel.

Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them.

Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.

Enable Perfect Forward Secrecy (PFS)

Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.

Diffie-Hellman Group

Asymmetric key algorithms used for public key cryptography.

Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.

Local Port

Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select *All*, or enter 0.

Remote Port	Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select <i>All</i> , or enter 0.
Protocol	Enter the IP protocol number of the service. To specify all services, select <i>All</i> , or enter 0.
Auto-negotiate	Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 1783 .
Autokey Keep Alive	Select this option for the tunnel to remain active when no data is being processed.
Key Lifetime	<p>Select the method for determining when the phase 2 key expires:</p> <ul style="list-style-type: none"> • <i>Seconds</i> • <i>Kilobytes</i> • <i>Both</i> <p>Enter a corresponding value for <i>Seconds</i> and/or <i>Kilobytes</i> in the text boxes. If <i>Both</i> is selected, the key expires when either the time has passed or the number of kilobytes have been processed.</p>

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for *Local Address* and *Remote Address*, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:

- The VPN peer is a third-party device that uses specific phase2 selectors.
- The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and `mode-cfg`.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:

- Routes guide traffic from one IP address to another.
- Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
- Quick mode selectors allow IKE negotiations only for allowed peers.
- Security policies control which IP addresses can connect to the VPN.
- Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.

If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

Using the add-route option

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

To configure add-route:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Auto-negotiate

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

To configure auto-negotiate:

```
config vpn ipsec phase2
    edit <phase2_name>
        set auto-negotiate enable
    next
end
```

Installing dynamic selectors via auto-negotiate

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

DHCP

The `dhcp-ipsec` option lets the FortiGate assign VIP addresses to FortiClient dialup clients through a DHCP server or relay. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user, and it only works in policy-based VPNs.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the

local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

ChaCha20 and Poly1305 AEAD cipher

In IKEv2 to support [RFC 7634](#), the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt` cipher in `cipher_chacha20poly1305.c`:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal chacha20poly1305
    next
end
```

AES-GCM for IKEv2 phase 1

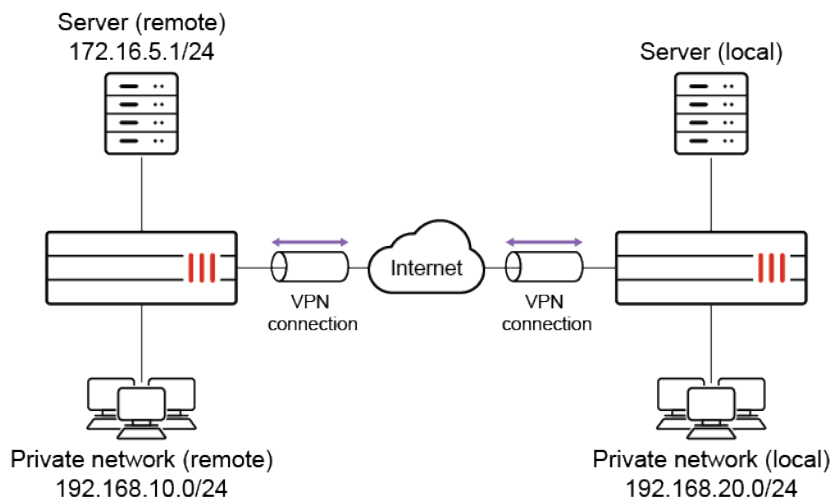

In IKEv2 to support [RFC 5282](#), the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal [aes128gcm | aes256gcm]
    next
end
```

VPN security policies

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.

Topology

Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, 192.168.10.0/255.255.255.0 or 192.168.10.0/24).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, 172.16.5.1/255.255.255.255, 172.16.5.1/32, or 172.16.5.1).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate's (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

Policy-based VPN

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see [Policy-based IPsec tunnel on page 1816](#). Be aware of the following before creating an IPsec policy.

Allow traffic to be initiated from the remote site

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the *Allow traffic to be initiated from the remote site* option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

Outbound and inbound NAT

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

Defining multiple IPsec policies for the same tunnel

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with *Action* set to *IPsec* before *ACCEPT* and *DENY*. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

Route-based VPN

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

To configure policies for a route-based VPN:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* and define an *ACCEPT* policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the interface that connects to the private network behind this FortiGate.

Outgoing Interface	Select the IPsec interface you configured.
Source	Select the address name you defined for the private network behind this FortiGate.
Destination	Select the address name you defined for the private network behind the remote peer.
Action	Select <i>ACCEPT</i> .
NAT	Disable <i>NAT</i> .

3. Click *OK*.

To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.

4. Click *Create New* and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the IPsec interface you configured.
Outgoing Interface	Select the interface that connects to the private network behind this FortiGate.
Source	Select the address name you defined for the private network behind the remote peer.
Destination	Select the address name you defined for the private network behind this FortiGate.
Action	Select <i>ACCEPT</i> .
NAT	Disable <i>NAT</i> .

5. Click *OK*.

Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an `unknown SPI` message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

Message meets Alert condition

```
date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxx logid="0101037131"
type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700"
logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88
remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A"
```

```
xauthuser="N/A" xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_
num="Received ESP packet with unknown SPI." spi="f6c9e2x1" seq="02000400"
```

The ESP packet handling process has the detection of unknown ESP packets enabled by default. You can disable the detection of unknown ESP packets using the `detect-unknown-esp` command.

To configure unknown ESP packet detection:

```
config system settings
    set detect-unknown-esp {enable | disable}
end
```

Note that invalid SPIs may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

```
config firewall addrgrp
    edit "All_exceptions"
        set member "all"
        set exclude enable
        set exclude-member "remote-vpn"
    next
end
```

2. Create a local-in policy that blocks IKE traffic from the address group:

```
config firewall local-in-policy
    edit 1
        set intf "wan1"
        set srcaddr "All_exceptions"
        set dstaddr "all"
        set service "IKE"
        set schedule "always"
    next
end
```

The default action is deny.

3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable

id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet
(proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1. "
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-
003442e7"
id=20085 trace_id=290 func=vf_ip_route_input_common line=2598 msg="find a route:
flag=84000000 gw=10.10.10.1 via root"
```

```
id=20085 trace_id=290 func=fw_local_in_handler line=430 msg="iprope_in_check() check
failed on policy 1, drop"
```

Configurable IKE port

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

To set the IKE port:

```
config system settings
    set ike-port <integer>
end
```

ike-port	UDP port for IKE/IPsec traffic (1024 - 65535, default = 500).
----------	---

Example 1: site-to-site VPN without NAT

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

To set the IKE port:

```
config system settings
    set ike-port 6000
end
```

To configure and check the site-to-site VPN:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
        set psksecret *****
    next
end
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
```

```

    next
end

```

2. Check the IKE gateway list and confirm that the specified port is used:

```

# diagnose vpn ike gateway list

vd: root/0
name: s2s
version: 2
interface: port27 17
addr: 173.1.1.1:6000 -> 11.101.1.1:6000
tun_id: 11.101.1.1
remote_location: 0.0.0.0
created: 194s ago
PPK: no
IKE SA: created 1/2 established 1/2 time 0/4500/9000 ms
IPsec SA: created 1/2 established 1/2 time 0/4500/9000 ms
...

```

3. Check the VPN tunnel list:

```

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encap=none/520 options[0208]=npu
frag-rfc run_state=0 accept_traffic=1 overlay_id=0
...

```

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

```

config system settings
    set ike-port 5000
end

```

To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

```

config vpn ipsec phase1-interface
    edit "server"
        set type dynamic
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
    end
end

```

```

chacha20poly1305-prfsha256
    set dpd on-idle
    set wizard-type static-fortigate
    set psksecret *****
    set dpd-retryinterval 60
next
end
config vpn ipsec phase2-interface
    edit "server"
        set phase1name "server"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "server_local"
        set dst-name "server_remote"
    next
end

```

2. Check the IKE gateway list and confirm that the specified port is used:

```

# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
...

```

3. Check the VPN tunnel list:

```

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options
[0388]=npu rgwy-chg rport-chg frag-rfc run_state=0 accept_traffic=1 overlay_id=0
...

```

IPsec VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In IPsec VPN, IP addresses can be held for the specified delay interval before being released back into the pool for assignment. The first-available address assignment method is still used.

Example

In this example, two PCs connect to the VPN. The IP address reuse delay interval is used to prevent a released address from being reused for at least four minutes. After the interval elapses, the IP address becomes available to clients again. Dual stack address assignment (both IPv4 and IPv6) is used.

To configure IPsec VPN with an IP address reuse delay interval:

1. Configure the IPsec phase1 interface, setting the IP address reuse delay interval to 240 seconds:

```
config vpn ipsec phase1-interface
  edit "FCT"
    set type dynamic
    set interface "port27"
    set mode aggressive
    set peertype any
    set net-device disable
    set mode-cfg enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set wizard-type dialup-forticlient
    set xauthtype auto
    set authusrgrp "local-group"
    set ipv4-start-ip 10.20.1.1
    set ipv4-end-ip 10.20.1.100
    set dns-mode auto
    set ipv4-split-include "FCT_split"
    set ipv6-start-ip 2001::1
    set ipv6-end-ip 2001::2
    set ip-delay-interval 240
    set save-password enable
    set psksecret *****
  next
end
```

2. Configure the IPsec phase2 interface:

```
config vpn ipsec phase2-interface
  edit "FCT"
    set phasename "FCT"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  next
  edit "FCT6"
    set phasename "FCT"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
    set src-addr-type subnet6
    set dst-addr-type subnet6
```

```

    next
end

```

To test the results:

1. Connect to the VPN with FortiClient 1 on PC1 then check the assigned IP address:

```

# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:60417
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 14s ago
xauth-user: userc
2FA: no
FortiClient UID: 7C0897D80C8E4B6DAC775DD6B0F93BAA
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1 established 1/1 time 100/100/100 ms
IPsec SA: created 2/2 established 2/2 time 0/5/10 ms

id/spi: 2 66140ba3e38b9b07/b64668f110ca4a48
direction: responder
status: established 14-14s ago = 100ms
proposal: aes256-sha256
key: 356637ee6e9a9cb5-fade432c09efb8aa-54be307fc1eeeab5-6e4b9ef19f98d5fa
lifetime/rekey: 86400/86115
DPD sent/recvd: 00000000/00000394

```

2. Disconnect FortiClient 1 and connect with FortiClient 2. The IP address assigned to FortiClient 1 is not released to the pool, and a different IP address is assigned to FortiClient 2:

```

# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 6s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.2/255.255.255.255
assigned IPv6 address: 2001::2/128
nat: peer
IKE SA: created 1/1 established 1/1 time 110/110/110 ms
IPsec SA: created 2/2 established 2/2 time 0/5/10 ms

```

```
id/spi: 3 b25141d5a915e67e/b32decdb8cf98318
direction: responder
status: established 6-6s ago = 110ms
proposal: aes256-sha256
key: 374ab753f3207ea0-83496b5cb24b5a8d-c51da1fd505cf3a4-727884839897808a
lifetime/rekey: 86400/86123
DPD sent/recv: 00000000/00000453
```

- Wait for 240 seconds, then disconnect and reconnect FortiClient 2. The IP address previously assigned to FortiClient 1 has been released back to the pool, and is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 20s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1 established 1/1 time 100/100/100 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms

id/spi: 4 fb1fbad0c12f5476/aa06a2de76964f63
direction: responder
status: established 20-20s ago = 100ms
proposal: aes256-sha256
key: af43f1bb876dc79c-16448592fe608dc3-f251746d71b2c35d-c848e8c03bf738e9
lifetime/rekey: 86400/86109
DPD sent/recv: 00000000/000000a9
```

Instead of waiting for 240 seconds, you can instead use the `diagnose vpn ike gateway flush` command to release the previously used IP addresses back into the pool.

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- [FortiGate-to-FortiGate on page 1795](#)
- [FortiGate-to-third-party on page 1822](#)

FortiGate-to-FortiGate

This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- [Basic site-to-site VPN with pre-shared key on page 1795](#)
- [Site-to-site VPN with digital certificate on page 1800](#)
- [Site-to-site VPN with overlapping subnets on page 1807](#)
- [GRE over IPsec on page 1811](#)
- [Policy-based IPsec tunnel on page 1816](#)

Basic site-to-site VPN with pre-shared key

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a pre-shared key.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key in the GUI:

1. Configure the HQ1 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.202.1*.
 - iii. For *Outgoing interface*, enter *port1*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter *sample* as the key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0*.
 - iv. Click *Create*.

2. Configure the HQ2 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.200.1*.
 - iii. For *Outgoing interface*, enter *port25*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter *sample* as the key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*.
 - iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.

- a. Configure HQ1.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

- b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
```

```

    next
end

```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

- a. Configure HQ1.

```

config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end

```

- b. Configure HQ2.

```

config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end

```

3. Configure the IPsec phase1-interface.

- a. Configure HQ1.

```

config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end

```

- b. Configure HQ2.

```

config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
    next
end

```

4. Configure the IPsec phase2-interface.

- a. Configure HQ1.

```

config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phaselname "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

```

    next
end

```

b. Configure HQ2.

```

config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

- 5. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.**

a. Configure HQ1.

```

config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end

```

b. Configure HQ2.

```

config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end

```

- 6. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.**

a. Configure HQ1.

```

config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next

```

```

edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "to_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

```

b. Configure HQ2.

```

config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

- 7. Run diagnose commands.** The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish. If the PSK failed to match, the following error shows up in the debug output:

```

ike 0:to_HQ2:15037: parse error
ike 0:to_HQ2:15037: probable pre-shared secret mismatch'

```

The following commands are useful to check IPsec phase1/phase2 interface status.

- a. Run the diagnose vpn ike gateway list command on HQ1.** The system should return the following:

```

vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024
direction: responder
status: established 5-5s ago = 0ms
proposal: aes128-sha256

```

```
key: b3efb46d0d385aff-7bb9ee241362ee8d
lifetime/rekey: 86400/86124
DPD sent/recvd: 00000000/00000000
```

- b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:

```
list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

```

Site-to-site VPN with digital certificate

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate installed on the other peer.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate in the GUI:

1. Import the certificate.
2. Configure user peers.
3. Configure the HQ1 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.

- b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.202.1*.
 - iii. For *Outgoing interface*, enter *port1*.
 - iv. For *Authentication Method*, select *Signature*.
 - v. In the *Certificate name* field, select the imported certificate.
 - vi. From the *Peer Certificate CA* dropdown list, select the desired peer CA certificate.
 - vii. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0*.
 - iv. Click *Create*.
4. Configure the HQ2 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.200.1*.
 - iii. For *Outgoing interface*, enter *port25*.
 - iv. For *Authentication Method*, select *Signature*.
 - v. In the *Certificate name* field, select the imported certificate.
 - vi. From the *Peer Certificate CA* dropdown list, select the peer CA certificate.
 - vii. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*.
 - iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
 - a. Configure HQ1.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
```

```
        edit 1
            set gateway 172.16.200.3
            set device "port1"
        next
    end
```

b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

a. Configure HQ1.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure the import certificate and its CA certificate information. The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in Fortinet_Factory certificate and the Fortinet_CA CA certificate are used for authentication, you can skip this step.

a. Configure HQ1.

```
config vpn certificate local
    edit "test1"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
```

```
    next
end
```

b. Configure HQ2.

```
config vpn certificate local
    edit "test2"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

4. Configure the peer user. The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.

a. If not using the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate, do the following:

i. Configure HQ1.

```
config user peer
    edit "peer1"
        set ca "CA_Cert_1"
    next
end
```

ii. Configure HQ2.

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
    next
end
```

b. If the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate are used for authentication, the peer user must be configured based on Fortinet_CA.

i. Configure HQ1.

```
config user peer
    edit "peer1"
        set ca "Fortinet_CA"
    next
end
```

ii. Configure HQ2.

```
config user peer
    edit "peer2"
        set ca "Fortinet_CA"
    next
end
```

5. Configure the IPsec phase1-interface.**a. Configure HQ1.**

```

config vpn ipsec phase1-interface
  edit "to_HQ2"
    set interface "port1"
    set authmethod signature
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set certificate "test1"
    set peer "peer1"
  next
end

```

b. Configure HQ2.

```

config vpn ipsec phase1-interface
  edit "to_HQ1"
    set interface "port25"
    set authmethod signature
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set certificate "test2"
    set peer "peer2"
  next
end

```

6. Configure the IPsec phase2-interface.**a. Configure HQ1.**

```

config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phase1name "to_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end

```

b. Configure HQ2.

```

config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phase1name "to_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end

```

7. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.**a. Configure HQ1.**

```

config router static
  edit 2
    set dst 172.16.101.0 255.255.255.0

```

```
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

b. Configure HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

8. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

a. Configure HQ1.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
```

```

        set action accept
        set schedule "always"
        set service "ALL"
    next
edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "to_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

```

9. Run **diagnose commands**. The **diagnose debug application ike -1** command is the key to troubleshoot why the IPsec tunnel failed to establish. If the remote FortiGate certificate cannot be validated, the following error shows up in the debug output:

```
ike 0: to_HQ2:15314: certificate validation failed
```

The following commands are useful to check IPsec phase1/phase2 interface status.

- a. Run the **diagnose vpn ike gateway list** command on HQ1. The system should return the following:

```

vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 7s ago
peer-id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2
peer-id-auth: yes
IKE SA: created 1/1 established 1/1 time 70/70/70 ms
IPsec SA: created 1/1 established 1/1 time 80/80/80 ms
id/spi: 15326 295be407fbddfc13/7a5a52afa56adf14 direction: initiator status:
established 7-7s ago = 70ms proposal: aes128-sha256 key: 4aa06dbec359a4c7-
43570710864bcf7b lifetime/rekey: 86400/86092 DPD sent/recvd: 00000000/00000000 peer-
id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2

```

- b. Run the **diagnose vpn tunnel list** command on HQ1. The system should return the following:

```

list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.200.1
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_

Site-to-site VPN with overlapping subnets

This is a sample configuration of IPsec VPN to allow transparent communication between two overlapping networks that are located behind different FortiGates using a route-based tunnel with source and destination NAT.

In the following topology, both FortiGates (HQ and Branch) use 192.168.1.0/24 as their internal network, but both networks need to be able to communicate to each other through the IPsec tunnel.

New virtual subnets of equal size must be configured and used for all communication between the two overlapping subnets. The devices on both local networks do not need to change their IP addresses. However, the devices and users must use the new subnet range of the remote network to communicate across the tunnel.

Configuring the HQ FortiGate

To configure IPsec VPN:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-Branch* and click *Next*.
3. For the *IP Address*, enter the Branch public IP address (*172.25.177.46*), and for *Interface*, select the HQ WAN interface (*wan1*).
4. For *Pre-shared Key*, enter a secure key. You will use the same key when configuring IPsec VPN on the Branch FortiGate.
5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.1.1.0/24*) and *Remote Address* (*10.2.2.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network > Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.2.2.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-Branch*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*. This is a best practice for route-based IPsec VPN tunnels because it ensures traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down.

To configure the address objects:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. For *Name*, enter *HQ-original*.
3. For *IP/Netmask*, enter the original LAN subnet of HQ (*192.168.1.0/24*).
4. For *Interface*, select the LAN-side interface (*internal*).
5. Click *OK*.
6. Create another address object named *Branch-new*, but for *IP/Netmask*, enter the new LAN subnet of Branch (*10.2.2.0/24*), and select the VPN interface (*VPN-to-Branch*).

To configure the IP pool:

1. Go to *Policy & Objects > IP Pools* and click *Create New*.
2. For *Name*, enter *HQ-new*.
3. For *Type*, select *Fixed Port Range*.
4. Enter the *External IP address/range* (*10.1.1.1 – 10.1.1.254*, the new HQ subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original HQ subnet).
5. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
2. For *Name*, enter *HQ-new-to-original*.
3. For *Interface*, select the VPN interface (*VPN-to-Branch*).
4. Enter the *External IP address/range* (*10.1.1.1 – 10.1.1.254*, the new HQ subnet) and *Map to IPv4 address/range* (*192.168.1.1 – 192.168.1.254*, the original HQ subnet).
5. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-HQ-to-Branch*.
3. For *Incoming Interface*, select the LAN-side interface (*internal*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-Branch*).
5. For *Source*, select *HQ-original*.
6. For *Destination*, select *Branch-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *HQ-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Click *Create New* and for *Name*, enter *From-Branch-to HQ*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-Branch*).
3. For *Outgoing Interface*, select the LAN-side interface (*internal*).
4. For *Source*, select *Branch-new*.
5. For *Destination*, select the *HQ-new-to-original* VIP.

6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

Configuring the Branch FortiGate

To configure IPsec VPN:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-HQ* and click *Next*.
3. For the *IP Address*, enter the HQ public IP address (*172.25.176.142*), and for *Interface*, select the Branch WAN interface (*wan1*).
4. For *Pre-shared Key*, enter the matching secure key used in the *VPN-to-Branch* tunnel.
5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.2.2.0/24*) and *Remote Address* (*10.1.1.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network > Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.1.1.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-HQ*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*.

To configure the address objects:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. For *Name*, enter *Branch-original*.
3. For *IP/Netmask*, enter the original LAN subnet of Branch (*192.168.1.0/24*).
4. For *Interface*, select the LAN-side interface (*lan*).
5. Click *OK*.
6. Create another address object named *HQ-new*, but for *IP/Netmask*, enter the new LAN subnet of HQ (*10.1.1.0/24*), and select the VPN interface (*VPN-to-HQ*).

To configure the IP pool:

1. Go to *Policy & Objects > IP Pools* and click *Create New*.
2. For *Name*, enter *Branch-new*.
3. For *Type*, select *Fixed Port Range*.
4. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
5. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
2. For *Name*, enter *Branch-new-to-original*.
3. For *Interface*, select the VPN interface (*VPN-to-HQ*).
4. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Map to IPv4 address/range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
5. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-Branch-to-HQ*.
3. For *Incoming Interface*, select the LAN-side interface (*lan*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
5. For *Source*, select *Branch-original*.
6. For *Destination*, select *HQ-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *Branch-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Click *Create New* and for *Name*, enter *From-HQ-to-Branch*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
3. For *Outgoing Interface*, select the LAN-side interface (*lan*).
4. For *Source*, select *HQ-new*.
5. For *Destination*, select the *Branch-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

To verify the communication across the tunnel:

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand to full screen view. The tunnels should be up on both FortiGates. If you did not enable *Auto-negotiate* in the IPsec VPN settings, you may have to select the tunnel and click *Bring Up*.
2. From a PC on the HQ network, ping a PC on the Branch network using the new IP for the Branch PC. The ping should be successful.

```
C:\Users\jheadley>ping 10.2.2.98

Pinging 10.2.2.98 with 32 bytes of data:
Reply from 10.2.2.98: bytes=32 time=7ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62

```

GRE over IPsec

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.

To configure GRE over an IPsec tunnel:

- Enable subnet overlapping at both HQ1 and HQ2.

```
config system settings
    set allow-subnet-overlap enable
end
```

2. Configure the WAN interface and static route.**a. HQ1.**

```
config system interface
  edit "port1"
    set ip 172.16.200.1 255.255.255.0
  next
  edit "dmz"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.3
    set device "port1"
  next
end
```

b. HQ2.

```
config system interface
  edit "port25"
    set ip 172.16.202.1 255.255.255.0
  next
  edit "port9"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port25"
  next
end
```

3. Configure IPsec phase1-interface and phase2-interface.**a. HQ1.**

```
config vpn ipsec phase1-interface
  edit "greipsec"
    set interface "port1"
    set peertype any
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample
  next
end
config vpn ipsec phase2-interface
  edit "greipsec"
    set phase1name "greipsec"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set protocol 47
  next
end
```

b. HQ2.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port25"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

4. Configure IPsec tunnel interface IP address.**a. HQ1.**

```
config system interface
    edit "greipsec"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

b. HQ2.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

5. Configure the GRE tunnel.**a. HQ1.**

```
config system gre-tunnel
    edit "gre_to_HQ2"
        set interface "greipsec"
        set remote-gw 10.10.10.2
        set local-gw 10.10.10.1
    next
end
```

b. HQ2.

```
config system gre-tunnel
    edit "gre_to_HQ1"
        set interface "greipsec"
        set remote-gw 10.10.10.1
        set local-gw 10.10.10.2
    next
end
```

6. Configure the firewall policy.**a. HQ1.**

```
config firewall policy
  edit 1
    set srcintf "dmz"
    set dstintf "gre_to_HQ2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set srcintf "gre_to_HQ2"
    set dstintf "dmz"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 3
    set srcintf "greipsec"
    set dstintf "greipsec"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. HQ2.

```
config firewall policy
  edit 1
    set srcintf "port9"
    set dstintf "gre_to_HQ1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set srcintf "gre_to_HQ1"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 3
    set srcintf "greipsec"
    set dstintf "greipsec"
```

```

        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

7. Configure the static route.

a. HQ1.

```

config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "gre_to_HQ2"
    next
end

```

b. HQ2.

```

config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "gre_to_HQ1"
    next
end

```

To view the VPN tunnel list on HQ1:

```

```

Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology

Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- [Configure the IPsec VPN at HQ.](#)
- [Configure the IPsec concentrator at HQ.](#)
- [Configure the firewall policy at HQ.](#)
- [Configure IPsec VPN at branch 1.](#)
- [Configure the firewall policy at branch 1.](#)
- [Configure IPsec VPN at branch 2.](#)
- [Configure the firewall policy at branch 2.](#)

To configure the IPsec VPN at HQ:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
 - a. Enter a *VPN Name*. In this example, *to_branch1*.
 - b. For *Template Type*, click *Custom*. Click *Next*.
 - c. Uncheck *Enable IPsec Interface Mode*.
 - d. For *Remote Gateway*, select *Static IP Address*.
 - e. Enter IP address, in this example, *15.1.1.2*.
 - f. For *Interface*, select *port9*.
 - g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
 - h. Click *OK*.

2. Go to *VPN > IPsec Wizard* to set up branch 2.
 - a. Enter a *VPN Name*. In this example, *to_branch2*.
 - b. For *Template Type*, click *Custom*. Click *Next*.
 - c. Uncheck *Enable IPsec Interface Mode*.
 - d. For *Remote Gateway*, select *Static IP Address*.
 - e. Enter IP address, in this example, *13.1.1.2*.
 - f. For *Interface*, select *port9*.
 - g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
 - h. Click *OK*.

To configure the IPsec concentrator at HQ:

1. Go to *VPN > IPsec Concentrator* and click *Create New*.
2. Enter a name. In this example, *branch*.
3. Add the *Members to_branch1* and *to_branch2*.
4. Click *OK*.

To configure the firewall policy at HQ:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 1:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 1:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.

6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click **OK**.

To configure IPsec VPN at branch 2:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click **OK**.

To configure the firewall policy at branch 2:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *to_HQ*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click **OK**.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the HQ IPsec phase1 and phase2.

```
config vpn ipsec phase1
    edit "to_branch1"
```

```
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 15.1.1.2
        set psksecret sample
        next
    edit "to_branch2"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 13.1.1.2
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_branch1"
        set phase1name "to_branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        next
    edit "to_branch2"
        set phase1name "to_branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "10.1.100.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch1"
    next
    edit 2
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "192.168.4.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch2"
    next
end
```

4. Configure the IPsec concentrator at HQ.

```
config vpn ipsec concentrator
  edit "branch"
    set member "to_branch1" "to_branch2"
  next
end
```

5. Configure the branch WAN interface and static route.**a. For branch 1.**

```
config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 15.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 15.1.1.1
    set device "wan1"
  next
end
```

b. For branch 2.

```
config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 13.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 192.168.4.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 13.1.1.1
    set device "wan1"
  next
end
```

6. Configure the branch IPsec phase1 and phase2.**a. For branch 1.**

```
config vpn ipsec phase1
  edit "to_HQ"
    set interface "wan1"
    set peertype any
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 22.1.1.1
    set psksecret sample
  next
end
config vpn ipsec phase2
```

```
    edit "to_HQ"
        set phasename "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

b. For branch 2.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
    next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phasename "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the branch firewall policy.

a. For branch 1.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.1.100.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

b. For branch 2.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "192.168.4.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

To view the IPsec VPN tunnel list at HQ:

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:

- [IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 1823](#)
- [IPsec VPN to Azure with virtual network gateway on page 1829](#)
- [IPsec VPN to an Azure with virtual WAN on page 1837](#)
- [IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 1841](#)
- [Cisco GRE-over-IPsec VPN on page 1841](#)

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:

- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebcd2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal as described in [Create a Secure Connection using AWS VPC](#).

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
 - a. [Configure Internet Key Exchange \(IKE\)](#).
 - b. [Configure IPsec](#).
 - c. [Configure the tunnel interface](#).
 - d. [Configure border gateway protocol \(BGP\)](#).
 - e. [Configure firewall policies](#).
2. Configure the second VPN tunnel:
 - a. [Configure Internet Key Exchange \(IKE\)](#).
 - b. [Configure IPsec](#).
 - c. [Configure the tunnel interface](#).
 - d. [Configure BGP](#).
 - e. [Configure firewall policies](#).

To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
  edit vpn-07e988cccl46f749-0
    set interface "wan1"
    set dpd enable
    set local-gw 35.170.66.108
    set dhgrp 2
    set proposal aes128-sha1
    set keylife 28800
    set remote-gw 3.214.239.164
    set psksecret iCelks0U0ob8z4SYMRM6zlx.rU2C3jth
    set dpd-retryinterval 10
  next
end
```

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
  edit "vpn-07e988cccl46f749-0"
    set phase1name "vpn-07e988cccl46f749-0"
    set proposal aes128-sha1
    set dhgrp 2
    set pfs enable
    set keylifeseconds 3600
  next
end
```

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
  edit "vpn-07e988cccl46f749-0"
    set vdom "root"
    set ip 169.254.45.90 255.255.255.255
    set allowaccess ping
    set type tunnel
    set tcp-mss 1379
    set remote-ip 169.254.45.89
    set mtu 1427
    set interface "wan1"
```

```
    next
end
```

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
    set as 65000
    config neighbor
        edit 169.254.45.89
            set remote-as 64512
        end
    end
end
config router bgp
    config neighbor
        edit 169.254.45.89
            set capability-default-originate enable
        end
    end
end
config router prefix-list
    edit "default_route"
        config rule
            edit 1
                set prefix 0.0.0.0 0.0.0.0
            next
        end
    end
end
config router route-map
    edit "routemap1"
        config rule
            edit 1
                set match-ip-address "default_route"
            next
        end
    next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
    edit 1
        set prefix 192.168.0.0 255.255.0.0
    next
end
```

To configure firewall policies for the first VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```
config firewall policy
  edit 5
    set srcintf "vpn-07e988cccd46f749-0"
    set dstintf internal
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
config firewall policy
  edit 5
    set srcintf internal
    set dstintf "vpn-07e988cccd46f749-0"
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
```

To configure IKE for the second VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
  edit vpn-07e988cccd46f749-1
    set interface "wan1"
    set dpd enable
    set local-gw 35.170.66.108
    set dhgrp 2
    set proposal aes128-sha1
    set keylife 28800
    set remote-gw 100.25.187.58
    set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
```

```
        set dpd-retryinterval 10
    next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
    edit "vpn-07e988cccd46f749-1"
        set phase1name "vpn-07e988cccd46f749-1"
        set proposal aes128-sha1
        set dhgrp 2
        set pfs enable
        set keylifeseconds 3600
    next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
    edit "vpn-07e988cccd46f749-1"
        set vdom "root"
        set ip 169.254.44.162 255.255.255.255
        set allowaccess ping
        set type tunnel
        set tcp-mss 1379
        set remote-ip 169.254.44.161
        set mtu 1427
        set interface "wan1"
    next
end
```

To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
    set as 65000
    config neighbor
        edit 169.254.44.161
```

```
        set remote-as 64512
    end
config router bgp
    config neighbor
        edit 169.254.44.161
            set capability-default-originate enable
        end
    end
config router prefix-list
    edit "default_route"
        config rule
            edit 1
                set prefix 0.0.0.0 0.0.0.0
            next
        end
    end
end
config router route-map
    edit "routemap1"
        config rule
            edit 1
                set match-ip-address "default_route"
            next
        end
    next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
    edit 1
        set prefix 192.168.0.0 255.255.0.0
    next
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```
config firewall policy
    edit 6
        set srcintf "vpn-07e988cccd46f749-1"
        set dstintf internal
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ANY
    next
end
```

```
config firewall policy
  edit 6
    set srcintf internal

IPsec VPN to Azure with virtual network gateway

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

Prerequisites

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

Sample topology

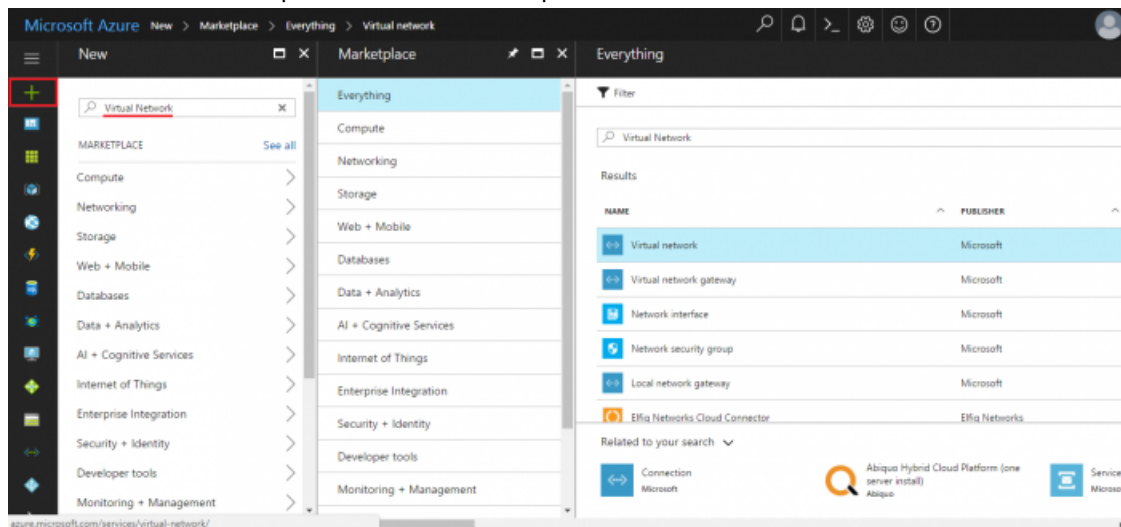

Sample configuration

This sample configuration shows how to:

1. [Configure an Azure virtual network](#)
2. [Specify the Azure DNS server](#)
3. [Configure the Azure virtual network gateway](#)
4. [Configure the Azure local network gateway](#)
5. [Configure the FortiGate tunnel](#)
6. [Create the Azure firewall object](#)
7. [Create the FortiGate firewall policies](#)
8. [Create the FortiGate static route](#)
9. [Create the Azure site-to-site VPN connection](#)
10. [Check the results](#)

To configure an Azure virtual network:

1. Log in to Azure and click *New*.
2. In *Search the Marketplace*, type *Virtual network*.
3. Click *Virtual network* to open the *Virtual network* pane.

4. At the bottom of the *Virtual network* pane, click the *Select a deployment model* dropdown list and select *Resource Manager*.
5. Click *Create*.

Virtual network
 Microsoft

Create a logically isolated section in Microsoft Azure with this networking service. You can securely connect it to your on-premises datacenter or a single client machine using an IPsec connection. Virtual Networks make it easy for you to take advantage of the scalable, on-demand infrastructure of Azure while providing connectivity to data and applications on-premises, including systems running on Windows Server, mainframes, and UNIX.

Use Virtual Network to:

- Extend your datacenter
- Build distributed applications
- Remotely debug your applications

Create

To specify the Azure DNS server:

1. Open the virtual network you just created.
2. Click *DNS servers* to open the *DNS servers* pane.
3. Enter the IP address of the DNS server and click *Save*.

kleroux_VPN - DNS servers

Add... ...

To configure the Azure virtual network gateway:

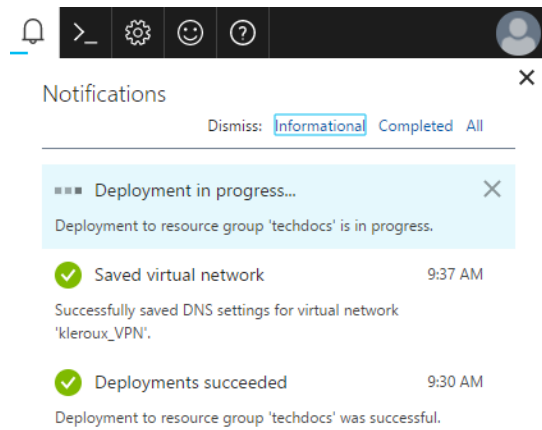

1. In the portal dashboard, go to *New*.
2. Search for *Virtual Network Gateway* and click it to open the *Virtual network gateway* pane.

3. Click *Create Virtual network gateways* and enter the settings for your virtual network gateway.

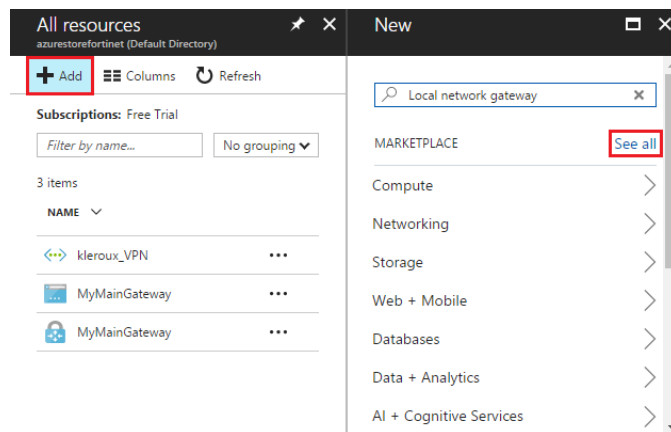

4. If needed, create a Public IP address.

5. Click *Create*.
Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.

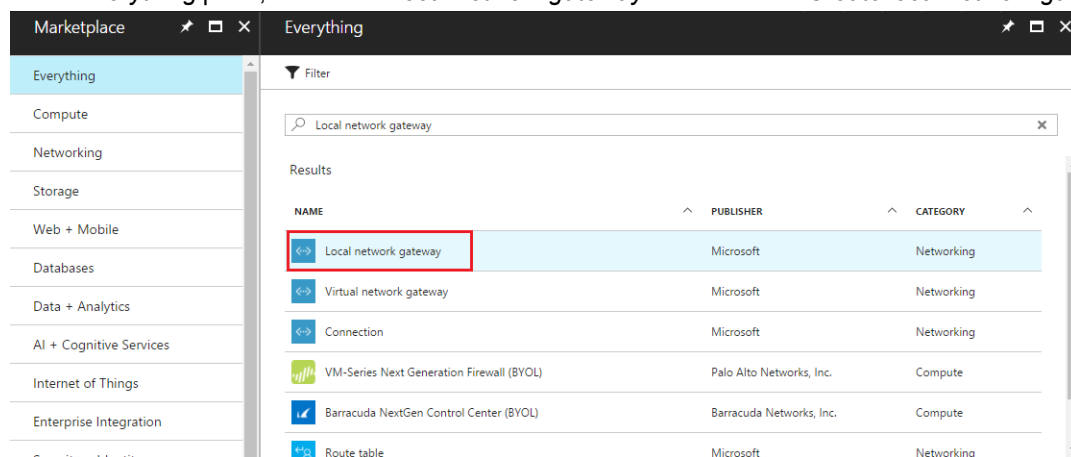

To configure the Azure local network gateway:

1. In the portal dashboard, click *All resources*.
2. Click *Add* and then click *See all*.

3. In the *Everything* pane, search for *Local network gateway* and then click *Create local network gateway*.

- For the *IP address*, enter the local network gateway IP address, that is, the FortiGate's external IP address.

Create local network gateway [X]

Create [Automation options](#)

- Set the remaining values for your local network gateway and click *Create*.

To configure the FortiGate tunnel:

- In the FortiGate, go to *VPN > IP Wizard*.
- Enter a *Name* for the tunnel, click *Custom*, and then click *Next*.
- Configure the *Network* settings.
 - For *Remote Gateway*, select *Static IP Address* and enter the IP address provided by Azure.
 - For *Interface*, select *wan1*.
 - For *NAT Traversal*, select *Disable*,
 - For *Dead Peer Detection*, select *On Idle*.
 - In the *Authentication* section, select
- Configure the *Authentication* settings.
 - For *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
 - For *IKE*, select *2*.
- Configure the *Phase 1 Proposal* settings.
 - Set the Encryption and Authentication combination to the three supported encryption algorithm combinations accepted by Azure.
 - AES256 and SHA1
 - 3DES and SHA1

- AES256 and SHA256
 - b. For *Diffie-Hellman Groups*, select 2.
 - c. Set *Key Lifetime (seconds)* to 28800.
6. In *Phase 2 Selectors*, expand the *Advanced* section to configure the *Phase 2 Proposal* settings.
- a. Set the Encryption and Authentication combinations:
 - AES256 and SHA1
 - 3DES and SHA1
 - AES256 and SHA256
 - b. Uncheck *Enable Perfect Forward Secrecy (PFS)*.
 - c. Set *Key Lifetime (seconds)* to 27000.
7. Click **OK**.

To create the Azure firewall object:

1. In the FortiGate, go to *Policy & Objects > Addresses*.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to *Policy & Objects > Firewall Policy*.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
 - a. Set the *Source* address and *Destination* address using the firewall objects you just created.
 - b. Disable *NAT*.
3. Create another policy that allows incoming traffic.
 - a. For this policy, reverse the *Source* address and *Destination* address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.

To do this, use the following CLI commands on both policies.

```
config firewall policy
  edit <policy-id>
    set tcp-mss-sender 1350
    set tcp-mss-receiver 1350
  next
end
```

To create the FortiGate static route:

1. In the FortiGate, go to *Network > Static Routes*.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the *Administrative Distance* to a value lower than the existing default route value.

To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the *Settings* pane, click *Connections* and then click *Add*.

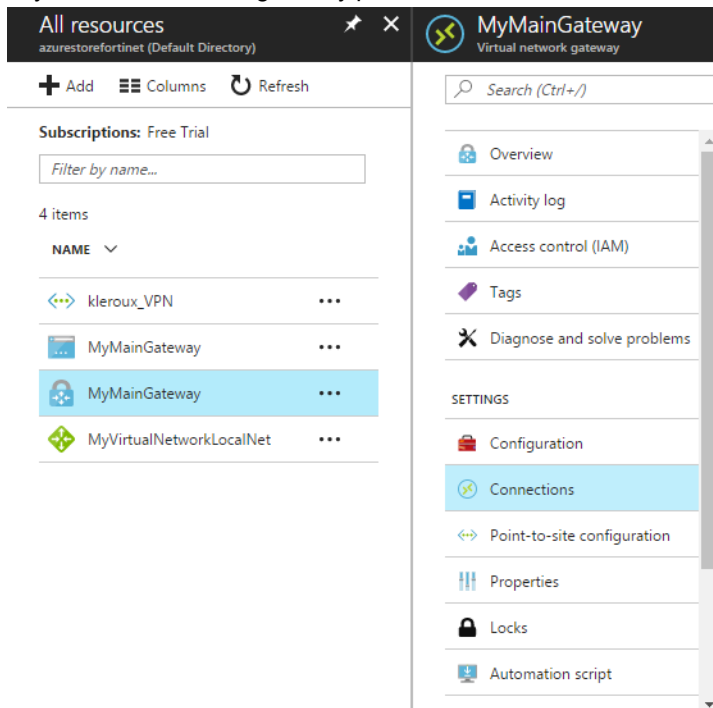

3. Enter the settings for your connection. Ensure the *Shared Key (PSK)* matches the *Pre-shared Key* for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to *Monitor > IPsec Monitor* and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select *Bring Up*.
2. In the FortiGate, go to *Log & Report > System Events*.
 - a. Select an event card to view more information and verify the connection.

3. In the Azure portal dashboard, click *All resources* and locate your virtual network gateway.
 - a. In your virtual network gateway pane, click *Connections* to see the status of each connection.

- b. Click a connection to open the *Essentials* pane to view more information about that connection.
 - If the connection is successful, the *Status* shows *Connected*.
 - See the *ingress* and *egress* bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in [Tutorial: Create a Site-to-Site connection using Azure Virtual WAN](#).

If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.

2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion":{"LastUpdatedTime":"2019-07-16T22:16:28.0409002Z","Version":"be5c5787-b903-43b1-a237-49eae1b373e4"},"vpnSiteConfiguration":{"Name":"toaws","IPAddress":"3.220.252.93","BgpSetting":
```

```
{
  "Asn": 7225,
  "BgpPeeringAddress": "169.254.24.25",
  "PeerWeight": 32768,
  "LinkName": "toaws",
  "vpnSiteConnections": [
    {
      "hubConfiguration": {
        "AddressSpace": "10.1.0.0/16",
        "Region": "West US",

            }
          }
        }
      }
    ]
  ]
}
```

3. Configure the following on the FortiGate. Note for set proposal, you can select from several proposals.

```
config vpn ipsec phase1-interface
  edit "toazure1"
    set interface "port1"
    set ike-version 2
    set keylife 28800
    set peertype any
    set proposal aes256-shal
    set dhgrp 2
    set remote-gw 52.180.90.47
    set psksecret *****
  next
edit "toazure2"
  set interface "port1"
  set ike-version 2
  set keylife 28800
  set peertype any
  set proposal aes256-shal
  set dhgrp 2
  set remote-gw 52.180.89.94
  set psksecret *****
next
end
config vpn ipsec phase2-interface
  edit "toazure1"
    set phasename "toazure1"
    set proposal aes256-shal
    set dhgrp 2
    set keylifeseconds 3600
  next
edit "toazure2"
  set phasename "toazure2"
  set proposal aes256-shal
  set dhgrp 2
  set keylifeseconds 3600
next
end
config system settings
  set allow-subnet-overlap enable
end
config system interface
  edit "toazure1"
    set vdom "root"
    set ip 169.254.24.25 255.255.255.255
    set type tunnel
    set remote-ip 10.1.0.7 255.255.255.255
    set snmp-index 4
    set interface "port1"
```

```

next
edit "toazure2"
    set vdom "root"
    set ip 169.254.24.25 255.255.255.255
    set type tunnel
    set remote-ip 10.1.0.6 255.255.255.255
    set snmp-index 5
    set interface "port1"
next
end
config router bgp
    set as 7225
    set router-id 169.254.24.25
    config neighbor
        edit "10.1.0.7"
            set remote-as 65515
        next
        edit "10.1.0.6"
            set remote-as 65515
        next
    end
    config network
        edit 1
            set prefix 172.30.101.0 255.255.255.0
        next
    end
    config redistribute "connected"
        set status enable
    end
    config redistribute "rip"
    end
    config redistribute "ospf"
    end
    config redistribute "static"
    end
    config redistribute "isis"
    end
    config redistribute6 "connected"
    end
    config redistribute6 "rip"
    end
    config redistribute6 "ospf"
    end
    config redistribute6 "static"
    end
    config redistribute6 "isis"
    end
end

```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```

name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

```

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

To configure multiple phase 2 interfaces in policy-based mode:

```
config vpn ipsec phase2
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.

Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. [Enable overlapping subnets.](#)
2. [Configure a route-based IPsec VPN on the external interface.](#)
3. [Configure a GRE tunnel on the virtual IPsec interface.](#)
4. [Configure security policies.](#)
5. [Configure the static route.](#)

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```

config system settings
    set allow-subnet-overlap enable
next
end

```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to **VPN > IPsec Wizard** and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key

Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

- Click **OK**.
- If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
    edit tocisco_p2
        set encapsulation transport-mode
    next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
    edit tocisco
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set remote-gw 192.168.5.113
        set psksecret xxxxxxxxxxxxxxxxx
    next
end

config vpn ipsec phase2-interface
    edit tocisco_p2
        set phaselname tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
```

```
    next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
        set remote-ip 10.0.1.2
    next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All

Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.
8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
  edit 1
    set name LANtoGRE
    set srcintf port2
    set dstintf gre1
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
  edit 2
    set name GREtoLAN
    set srcintf gre1
    set dstintf port2
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
  edit 3
    set name GREtoIPsec
    set srcintf gre1
    set dstintf tocisco
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
  edit 4
    set name IPsectoGRE
    set srcintf tocisco
    set dstintf gre1
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnel Traffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network > Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

To create the static route in the CLI:

```
config router static
  edit 0
    set device gre1
    set dst 10.21.101.0 255.255.255.0
  next
end
```

Configuring the Cisco router

For more information, refer to [Configuring and verifying a GRE over IPsec tunnel](#) in the Fortinet Knowledge Base.

Remote access

Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

The following topics provide instructions on configuring remote access:

- [FortiGate as dialup client on page 1848](#)
- [FortiClient as dialup client on page 1854](#)
- [Add FortiToken multi-factor authentication on page 1858](#)
- [Add LDAP user authentication on page 1859](#)
- [iOS device as dialup client on page 1860](#)
- [IKE Mode Config clients on page 1864](#)
- [IPsec VPN with external DHCP service on page 1869](#)
- [L2TP over IPsec on page 1872](#)
- [Tunneled Internet browsing on page 1876](#)
- [Dialup IPsec VPN with certificate authentication on page 1881](#)
- [Restricting VPN access to rogue/non-compliant devices with Security Fabric](#)

FortiGate as dialup client

This is a sample configuration of dialup IPsec VPN and the dialup client. In this example, a branch office FortiGate connects via dialup IPsec VPN to the HQ FortiGate.

You can configure dialup IPsec VPN with FortiGate as the dialup client using the [GUI](#) or [CLI](#).

To configure IPsec VPN with FortiGate as the dialup client in the GUI:

1. Configure the dialup VPN server FortiGate:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *The remote site is behind NAT*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Incoming Interface*, select the incoming interface.
 - ii. For *Authentication Method*, select *Pre-shared Key*.
 - iii. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - iv. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0/24*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
 - iv. Click *Create*.
2. Configure the dialup VPN client FortiGate:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *This site is behind NAT*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *IP Address*, enter *11.101.1.1*.
 - ii. For *Outgoing Interface*, select *port13*.
 - iii. For *Authentication Method*, select *Pre-shared Key*.

- iv. In the *Pre-shared Key* field, enter *your-psk* as the key.
- v. Click *Next*.
- c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface. In this example, it is *port9*.
 - ii. Configure the *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*.
 - iv. Click *Create*.

To configure IPsec VPN with FortiGate as the dialup client in the CLI:

1. In the CLI, configure the user, user group, and firewall address. Only the HQ dialup server FortiGate needs this configuration. The address is an IP pool to assign an IP address for the dialup client FortiGate.

```
config user local
  edit "vpnuser1"
    set type password
    set passwd your-password
  next
end
config user group
  edit "vpngroup"
    set member "vpnuser1"
  next
end
config firewall address
  edit "client_range"
    set type iprange
    set start-ip 10.10.10.1
    set end-ip 10.10.10.200
  next
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

a. Configure the HQ FortiGate.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 11.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 11.101.1.2
    set device "wan1"
  next
end
```

b. Configure the branch office FortiGate.

```
config system interface
  edit "port13"
    set vdom "root"
    set ip 173.1.1.1 255.255.255.0
```

```

        next
    end
    config router static
        edit 1
            set gateway 173.1.1.2
            set device "port13"
        next
    end

```

3. Configure the internal interface and protected subnet. The internal interface connects to the internal network. Traffic from this interface will route out the IPsec VPN tunnel.

- a. Configure the HQ FortiGate.

```

config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
config firewall address
    edit "10.1.100.0"
        set subnet 10.1.100.0 255.255.255.0
    next
end

```

- b. Configure the branch office FortiGate.

```

config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
config firewall address
    edit "172.16.101.0"
        set subnet 172.16.101.0 255.255.255.0
    next
end

```

4. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

- a. Configure the HQ FortiGate.

```

config vpn ipsec phase1-interface
    edit "for_Branch"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set net-device enable
        set assign-ip-from name
        set dns-mode auto
    end

```

```

        set ipv4-split-include "10.1.100.0"
        set ipv4-name "client_range"
        set save-password enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end

```

b. Configure the branch office FortiGate.

```

config vpn ipsec phase1-interface
    edit "to_HQ"
        set interface "port13"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set xauthtype client
        set authusr "vpnuser1"
        set authpasswd vpnuser1-password
        set remote-gw 11.101.1.1
        set psksecret sample
    next
end

```

5. Configure the IPsec phase2-interface.

a. Configure the HQ FortiGate:

```

config vpn ipsec phase2-interface
    edit "for_Branch_p2"
        set phase1 name "for_Branch"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
end

```

b. Configure the branch office FortiGate.

```

config vpn ipsec phase2-interface
    edit "to_HQ_p2"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
end

```

6. Configure the static routes on the branch office FortiGate. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```

config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable

```

```

        set distance 254
    next
end

```

7. Configure the firewall policy to allow the branch office to HQ network flow over the IPsec tunnel. This configuration only supports traffic from the branch office FortiGate to the HQ FortiGate. Traffic is dropped from the HQ FortiGate to the branch office FortiGate.

- a. Configure the HQ FortiGate.

```

config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_Branch"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

- b. Configure the branch office FortiGate.

```

config firewall policy
    edit 1
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

8. Run diagnose commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

- a. Run the `diagnose vpn ike gateway list` command on the HQ FortiGate. The system should return the following:

```

vd: root/0
name: for_Branch_0
version: 1
interface: wan1 5
addr: 11.101.1.1:500 -> 173.1.1.1:500
created: 1972s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.10.1/255.255.255.252
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 184 5b1c59fab2029e43/bf517e686d3943d2
direction: responder
status: established 1972-1972s ago = 10ms

FortiClient as dialup client

This is a sample configuration of dialup IPsec VPN with FortiClient as the dialup client.

You can configure dialup IPsec VPN with FortiClient as the dialup client using the GUI or CLI.

If multiple dialup IPsec VPNs are defined for the same dialup server interface, each phase1 configuration must define a unique peer ID to distinguish the tunnel that the remote client is connecting to. When a client connects, the first IKE message that is in aggressive mode contains the client's local ID. FortiGate matches the local ID to the dialup tunnel referencing the same Peer ID, and the connection continues with that tunnel.

To configure IPsec VPN with FortiClient as the dialup client on the GUI:

1. Configure a user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *vpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *vpngroup* with the member *vpnuser1*.
2. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - a. Enter a VPN name.
 - b. For *Template Type*, select *Remote Access*.
 - c. For *Remote Device Type*, select *Client-based > FortiClient*.
 - d. Click *Next*.

3. Configure the following settings for *Authentication*:
 - a. For *Incoming Interface*, select *wan1*.
 - b. For *Authentication Method*, select *Pre-shared Key*.
 - c. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - d. From the *User Group* dropdown list, select *vpngroup*.
 - e. Click *Next*.
4. Configure the following settings for *Policy & Routing*:
 - a. From the *Local Interface* dropdown menu, select *lan*.
 - b. Configure the *Local Address* as *local_network*.
 - c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
 - d. Keep the default values for the *Subnet Mask*, *DNS Server*, *Enable IPv4 Split tunnel*, and *Allow Endpoint Registration*.
 - e. Click *Next*.
5. Adjust the *Client Options* as needed, then click *Create*.
6. Optionally, define a unique Peer ID in the phase1 configuration:
 - a. Go to *VPN > IPsec Tunnels* and edit the just created tunnel.
 - b. Click *Convert To Custom Tunnel*.
 - c. In the *Authentication* section, click *Edit*.
 - d. Under *Peer Options*, set *Accept Types* to *Specific peer ID*.
 - e. In the *Peer ID* field, enter a unique ID, such as *dialup1*.
 - f. Click *OK*.

To configure IPsec VPN with FortiClient as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
```

```

        edit "local_subnet_2"
            set subnet 10.10.112.0 255.255.255.0
        next
    end
    config firewall addrgrp
        edit "local_network"
            set member "local_subnet_1" "local_subnet_2"
        next
    end

```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```

config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end

```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```

config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end

```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```

config vpn ipsec phase1-interface
    edit "for_client"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype one
        set peerid "dialup1"
        set net-device enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end

```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_client"
        set phase1name "for_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure FortiClient:

1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set the *VPN* to *IPsec VPN* and the *Remote Gateway* to the FortiGate IP address.
3. Set the *Authentication Method* to *Pre-Shared Key* and enter the key.
4. Expand *Advanced Settings > Phase 1* and in the *Local ID* field, enter *dialup1*.
5. Configure remaining settings as needed, then click *Save*.
6. Select the VPN, enter the username and password, then select *Connect*.

Diagnose the connection

Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -l` command is the key to troubleshoot why the IPsec tunnel failed to establish.

1. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_client_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 ->172.20.120.254:64916
created: 37s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.1.1/255.255.255.255
nat: me peer
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 1 b40a32d878d5e262/8bba553563a498f4
direction: responder
status: established 37-37s ago = 10ms
proposal: aes256-sha256
```

```
key: f4ad7ec3a4fcfd09-787e2e9b7bceb9a7-0dfa183240d838ba-41539863e5378381
lifetime/rekey: 86400/86092
DPD sent/recvd: 00000000/00000a0e
```

2. Run the diagnose vpn tunnel list command. The system should return the following:

```
list all ipsec tunnel in vd 0
=
=
name=for_client_0 ver=1 serial=3 172.20.120.123:4500->172.20.120.254:64916 tun_

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration ([FortiClient as dialup client on page 1854](#)). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Edit the user:
 - a. Go to *User & Authentication > User Definition* and edit local user *vpnuser1*.
 - b. Enable *Two-factor Authentication*.
 - c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
 - d. Enter the user's *Email Address*.
 - e. Enable *Send Activation Code* and select *Email*.
 - f. Click *Next* and click *Submit*.

2. Activate the mobile token.
 - a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

```
config user local
  edit "vpnuser1"
    set type password
    set two-factor fortitoken
    set fortitoken <select mobile token for the option list>
    set email-to <user's email address>
    set passwd <user's password>
  next
end
```

2. Activate the mobile token.
 - a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration ([FortiClient as dialup client on page 1854](#)). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
 - a. Go to *System > Certificates*.
If the *Certificates* option is not visible, enable it in *Feature Visibility*. See [Feature visibility on page 2702](#) for details.
 - b. Click *Import > CA Certificate*.
 - c. Set *Type* to *File*.
 - d. Click *Upload* then find and select the certificate file.
 - e. Click *OK*.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
 - f. Optionally, rename the system generated *CA_Cert_1* to something more descriptive:

```
config vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end
```

2. Configure the LDAP user:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.
 - c. Specify *Common Name Identifier* and *Distinguished Name*.
 - d. Set *Bind Type* to *Regular*.
 - e. Specify *Username* and *Password*.
 - f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.

- g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
- h. Click *OK*.
- 3. Add the LDAP user to the user group:
 - a. Go to *User & Authentication > User Groups* and edit the *vpngroup* group.
 - b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.
 - c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:

```
config user ldap
  edit "ldaps-server"
    set server "172.20.120.161"
    set cnid "cn"
    set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
    set type regular
    set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
    set password *****
    set group-member-check group-object
    set secure ldaps
    set ca-cert "LDAPS-CA"
    set port 636
  next
end
```

3. Add the LDAP user to the user group:

```
config user group
  edit "vpngroup"
    append member "ldaps-server"
  next
end
```

iOS device as dialup client

This is a sample configuration of dialup IPsec VPN with an iPhone or iPad as the dialup client.

You can configure dialup IPsec VPN with an iOS device as the dialup client using the [GUI](#) or [CLI](#).

To configure IPsec VPN with an iOS device as the dialup client on the GUI:

1. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - a. Enter a VPN name.
 - b. For *Template Type*, select *Remote Access*.

- c. For *Remote Device Type*, select *Native > iOS Native*.
 - d. For *NAT Configuration*, set *No NAT Between Sites*.
 - e. Click *Next*.
2. Configure the following settings for *Authentication*:
 - a. For *Incoming Interface*, select *wan1*.
 - b. For *Authentication Method*, select *Pre-shared Key*.
 - c. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - d. From the *User Group* dropdown list, select *vpngroup*.
 - e. Deselect *Require 'Group Name' on VPN client*.
 - f. Click *Next*.
3. Configure the following settings for *Policy & Routing*:
 - a. From the *Local Interface* dropdown menu, select *lan*.
 - b. Configure the *Local Address* as *local_network*.
 - c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
 - d. Keep the default values for the *Subnet Mask*, *DNS Server*, and *Enable IPv4 Split tunnel*.
 - e. Click *Create*.

To configure IPsec VPN with an iOS device as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end

config firewall address
    edit "local_subnet_1"
        set ip 10.10.111.0 255.255.255.0
    next
end

config firewall address
    edit "local_subnet_2"
        set ip 10.10.112.0 255.255.255.0
```

```
        next
    end

    config firewall addrgrp
        edit "local_network"
            set member "local_subnet_1" "local_subnet_2"
        next
    end
```

- 3. Configure the WAN interface.** The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

- 4. Configure the client address pool.** You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

- 5. Configure the IPsec phase1-interface.** In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_ios_p1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device enable
        set mode-cfg enable
        set proposal aes256-sha256 aes256-md5 aes256-sha1
        set dpd on-idle
        set dhgrp 14 5 2
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end
```

- 6. Configure the IPsec phase2-interface.**

```
config vpn ipsec phase2-interface
    edit "for_ios_p2"
```

```

        set phase1name "for_ios_p1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set pfs disable
        set keepalive enable
    next
end

```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```

config firewall policy
    edit 1
        set name "ios_vpn"
        set srcintf "for_ios_p1"
        set dstintf "lan"
        set srcaddr "ios_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

8. Configure the iOS device.

- a. In the iOS device, go to *Settings > General > VPN* and select *Add VPN Configuration*.
- b. Set the *Type* to *IPsec* and enter a *Description*. Set the *Server* to the FortiGate's Internet-facing interface, and enter the username in *Account*. Enter the user password, the preshared IPsec VPN secret, then select *Done*.
- c. Ensure that the IPsec VPN configuration is highlighted (indicated by a checkmark), and select the *Not Connected* button. The IPsec VPN connects with the user's credentials and secret. The status changes to *Connected*, and a VPN icon appears at the top of the screen.

9. Run diagnose commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

- a. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```

vd: root/0
name: for_ios_p1_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 -> 172.20.120.254:64916

IKE Mode Config clients

IKE Mode Config is an alternative to DHCP over IPsec. It allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server. A FortiGate can be configured as either an IKE Mode Config server or client.

IKE Mode Config can configure the host IP address, domain, DNS addresses, and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable disable}	Enable/disable IKE Mode Config.
type {static dynamic ddns}	If you set <code>type</code> to <code>dynamic</code> , an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.
proposal <encryption_combination>	The encryption and authentication settings that the client will accept.
ip-version {4 6}	By default, IPsec VPNs use IPv4 addressing.
ipv4-split-include <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2.

Parameter	Description
ipv6-split-include <string>	Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.
split-include-service <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets. See Split-exclude in IKEv1 .

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set type static
        set remote-gw <gw_address>
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set mode-cfg enable
        set assign-ip enable
    next
end
```

Split-exclude in IKEv1

The `split-exclude` option specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` options can be specified at the same time.

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 1
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
```

```
end
```

Creating an IKE Mode Config server

To configure IKE Mode config settings, the following must be configured first :

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface <interface_name>
        set ike-version < 1 | 2 >
        set mode-cfg enable
        set proposal <encryption_combination>
        set ip-version < 4 | 6 >
    next
end
```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
        set proposal 3des-sha1 aes128-sha1
        set dpd disable
        set dhgrp 2
        set authusrgrp "FG-Group1"
        set ipv4-start-ip 10.10.10.10
        set ipv4-end-ip 10.10.10.20
        set ipv4-dns-server1 1.1.1.1
        set ipv4-dns-server2 2.2.2.2
        set ipv4-dns-server3 3.3.3.3
        set ipv4-wins-server1 4.4.4.4
        set ipv4-wins-server2 5.5.5.5
        set domain "fgt1c-domain"
        set banner "fgt111C-banner"
        set backup-gateway "100.100.100.1" "host1.com" "host2"
        set ipv4-split-include OfficeLAN
    next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set assign-ip enable
        set assign-ip-from range
        set ipv4-start-ip <range_start>
        set ipv4-end-ip <range_end>
        set ipv4-netmask <netmask>
    next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set assign-ip-from name
        set ipv4-name <name>
        set ipv6-name <name>
    next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group <grp_name>. Since the IP address is not static, type is set to dynamic and mode-cfg is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgroup
        set xauthtype auto
        set authusrgroup <grp_name>
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end

config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asn1dn | fqdn}
    next
end
```

Split-exclude in IKEv1

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.

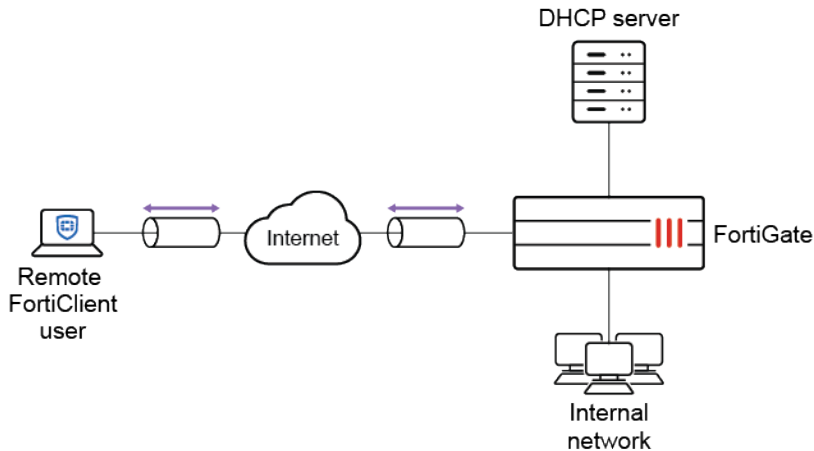

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 1
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

IPsec VPN with external DHCP service

You can use an external DHCP server to assign IP addresses to your IPsec VPN clients. This is a common scenario found in enterprises where all DHCP leases need to be managed centrally.

In this example, the DHCP server assigns IP addresses in the range of 172.16.6.100 to 172.16.6.120. The server is attached to internal2 on the FortiGate and has an IP address of 192.168.3.70.

To configure a DHCP server to assign IP addresses to IPsec VPN clients:

1. Create a user group for remote users:
 - a. Go to *User & Authentication > User Definition* and click *Create New*.
 - b. For *User Type*, select *Local User*.
 - c. Complete the wizard, and click *Submit*.
 - d. Go to *User & Authentication > User Groups* and click *Create New*.
 - e. Create a *Firewall* user group for your remote users.
 - f. For *Members*, add the user you just created.
 - g. Click *OK*.
2. Add a firewall address for the local network and IPsec VPN client range:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Create a new *Subnet* address for the LAN, including the IP mask and local interface (*internal2*).
 - c. Click *OK*.
 - d. Create a new *IP Range* address for the IPsec VPN client range (172.16.6.100–172.16.6.120).
 - e. Click *OK*.
3. Configure the IPsec VPN using a VPN tunnel in the CLI:

```
config vpn ipsec phase1-interface
  edit "dhcp_vpn"
    set type dynamic
    set interface "wan1"
    set mode aggressive
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set dhgrp 5
```

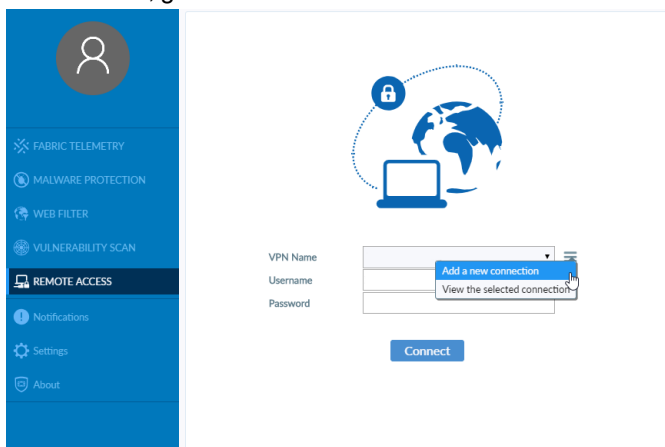

```

        set xauthtype auto
        set authusrgrp "ipsecvpn"
        set psksecret *****
        set dpd-retryinterval 60
    next
end

config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "dhcp_vpn"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set dhgrp 5
        set dhcp-ipsec enable
    next
end

```

4. Configure the IPsec VPN interface:
 - a. Go to *Network > Interfaces* and edit the newly created IPsec VPN interface.
 - b. Enable the *DHCP Server*.
 - c. Expand *Advanced* and change the *Mode* to *Relay*.
 - d. Enter the external DHCP server IP address (192.168.3.70).
 - e. Change the *Type* to *IPsec*.
 - f. Click *OK*.
5. Create a security policy for access to the local network:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Configure the following parameters:
 - i. Set the *Incoming Interface* to the tunnel interface created in step 3 (*dhcp_vpn*).
 - ii. Set the *Outgoing Interface* (*internal2*).
 - iii. Set the *Source* to the IPsec VPN client range defined in step 2 (*ipsecvpn_range*).
 - iv. Set the *Destination* to the subnet address defined in step 2 (*Local LAN*).
 - v. Set the *Service* to *ALL*.
 - c. Click *OK*.
6. Configure FortiClient:
 - a. In FortiClient, go to *REMOTE ACCESS > Add a new connection*.

- b. Configure the following parameters:
 - i. Set the *VPN* type to *IPsec VPN*.
 - ii. Enter a connection name.
 - iii. Set the *Remote Gateway* to the FortiGate external IP address.
 - iv. Set the *Authentication Method* to *Pre-shared key* and enter the key below.
 - v. Expand the *Advanced Settings > VPN Settings* and for *Options*, select *DHCP over IPsec*.
 - vi. Click **Save**.

- c. Select the new connection, and enter the user name and password.
- d. Click **Connect**.

Once the connection is established, the external DHCP server assigns the user an IP address and FortiClient displays the connection status, including the IP address, connection duration, and bytes sent and received.

Verification

1. In FortiOS, go to *Monitor > IPsec Monitor* and verify that the tunnel *Status* is *Up*.
2. Go to *Log & Report > Forward Traffic* and verify the *Sent / Received* column displays the traffic flow through the tunnel.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and `net-device` is set to enable in the `phase1-interface` settings. If `net-device` is set to disable, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.

To configure L2TP over an IPsec tunnel using the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Enter a *VPN Name*. In this example, *L2tpoIPsec*.
3. Configure the following settings for *VPN Setup*:
 - a. For *Template Type*, select *Remote Access*.
 - b. For *Remote Device Type*, select *Native* and *Windows Native*.
 - c. Click *Next*.
4. Configure the following settings for *Authentication*:
 - a. For *Incoming Interface*, select *port9*.
 - b. For *Authentication Method*, select *Pre-shared Key*.
 - c. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - d. For *User Group*, select *L2tpusergroup*.
 - e. Click *Next*.
5. Configure the following settings for *Policy & Routing*:
 - a. From the *Local Interface* dropdown menu, select *port10*.
 - b. Configure the *Local Address* as *172.16.101.0*.
 - c. Configure the *Client Address Range* as *10.10.10.1-10.10.10.100*.
 - d. Leave the *Subnet Mask* at its default value.
 - e. Click *Create*.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
```

```
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface on HQ.

```
config vpn ipsec phase1-interface
    edit "L2tpoIPsec"
        set type dynamic
        set interface "port9"
        set peertype any
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set dpd on-idle
        set dhgrp 2
        set net-device enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "L2tpoIPsec"
        set phaselname "L2tpoIPsec"
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set pfs disable
        set encapsulation transport-mode
        set l2tp enable
    next
end
```

3. Configure a user and user group on HQ.

```
config user local
    edit "usera"
        set type password
        set passwd usera
    next
end
config user group
    edit "L2tpusergroup"
        set member "usera"
    next
end
```

4. Configure L2TP on HQ.

```
config vpn l2tp
    set status enable
    set eip 10.10.10.100
    set sip 10.10.10.1
    set usrgroup "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```

config firewall address
    edit "L2TPclients"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.100
    next
end

```

6. Configure a firewall policy.

```

config firewall policy
    edit 1
        set name "Bridge_IPsec_port9_for_l2tp negotiation"
        set srcintf "L2tpoIPsec"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "L2TP"
    next
    edit 2
        set srcintf "L2tpoIPsec"
        set dstintf "port10"
        set srcaddr "L2TPclients"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To view the VPN tunnel list on HQ:

```

Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.

To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name, in this example, *HQ*.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *The remote site is behind NAT*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Incoming Interface*, select *port9*.
 - ii. For *Authentication Method*, select *Pre-shared Key*.
 - iii. In the *Pre-shared Key* field, enter *sample* as the key.
 - iv. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select *port10*.
 - ii. Configure the *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
 - iv. For *Internet Access*, select *Share Local*.
 - v. For *Shared WAN*, select *port9*.
 - vi. Click *Create*.
2. Configure the dialup VPN client FortiGate at a branch:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name, in this example, *Branch1* or *Branch2*.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *The remote site is behind NAT*.
 - v. Click *Next*.

- b. Configure the following settings for *Authentication*:
 - i. For *IP Address*, select *Remote Device* and enter 22.1.1.1.
 - ii. For *Outgoing Interface*, select wan1.
 - iii. For *Authentication Method*, select *Pre-shared Key*.
 - iv. In the *Pre-shared Key* field, enter *sample* as the key.
 - v. Click *Next*.
- c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select *internal*.
 - ii. Configure the *Local Subnets* as 10.1.100.0/192.1684.0.
 - iii. Configure the *Remote Subnets* as 0.0.0.0/0.
 - iv. For *Internet Access*, select *Use Remote*.
 - v. Configure the *Local Gateway* to 15.1.1.1/13.1.1.1.
 - vi. Click *Create*.

To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ.

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```
config vpn ipsec phase1-interface
  edit "HQ"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set psksecret sample
    set dpd-retryinterval 60
  next
end
config vpn ipsec phase2-interface
  edit "HQ"
    set phaselname "HQ"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
```

```
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "HQ"
        set dstintf "port9" "port10"
        set srcaddr "10.1.100.0" "192.168.4.0"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

4. Configure the WAN interface and static route on the FortiGate at the branches.

a. Branch1.

```
config system interface
    edit "wan1"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

b. Branch2.

```
config system interface
    edit "wan1"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.

a. Branch1.

```
config vpn ipsec phase1-interface
    edit "branch1"
```

```
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch1"
        set phase1name "branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

b. Branch2.

```
config vpn ipsec phase1-interface
    edit "branch2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch2"
        set phase1name "branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

6. Configure the firewall policy at the branches.

a. Branch1.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
next
edit 2
    set name "inbound"
    set srcintf "branch1"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

b. Branch2.

```
config firewall policy
edit 1
    set name "outbound"
    set srcintf "internal"
    set dstintf "branch2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "inbound"
    set srcintf "branch2"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

7. Configure the static routes at the branches.

a. Branch1.

```
config router static
edit 2
    set dst 22.1.1.1/32
    set gateway 15.1.1.1
    set device "wan1"
    set distance 1
next
edit 3
    set device "branch1"
    set distance 5
next
end
```

b. Branch2.

```
config router static
edit 2
```

```

        set dst 22.1.1.1/32
        set gateway 13.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch2"
        set distance 5
    next
end

```

8. Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command:

```

list all ipsec tunnel in vd 0
----
name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1.1

```

9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```

Routing table for VRF=0
S*    0.0.0.0/0 [5/0] is directly connected, branch1
S*    22.1.1.1/32 [1/0] via 15.1.1.1, wan1

```

Dialup IPsec VPN with certificate authentication

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate, instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the principal name in the Subject Alternative Name (SAN) field.

Subject field verification

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:

```
config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set subject "CN=tgerber"
  next
end
```

Common name verification

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```
config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set cn "tgerber"
  next
end
```

The matching certificate looks like the following:

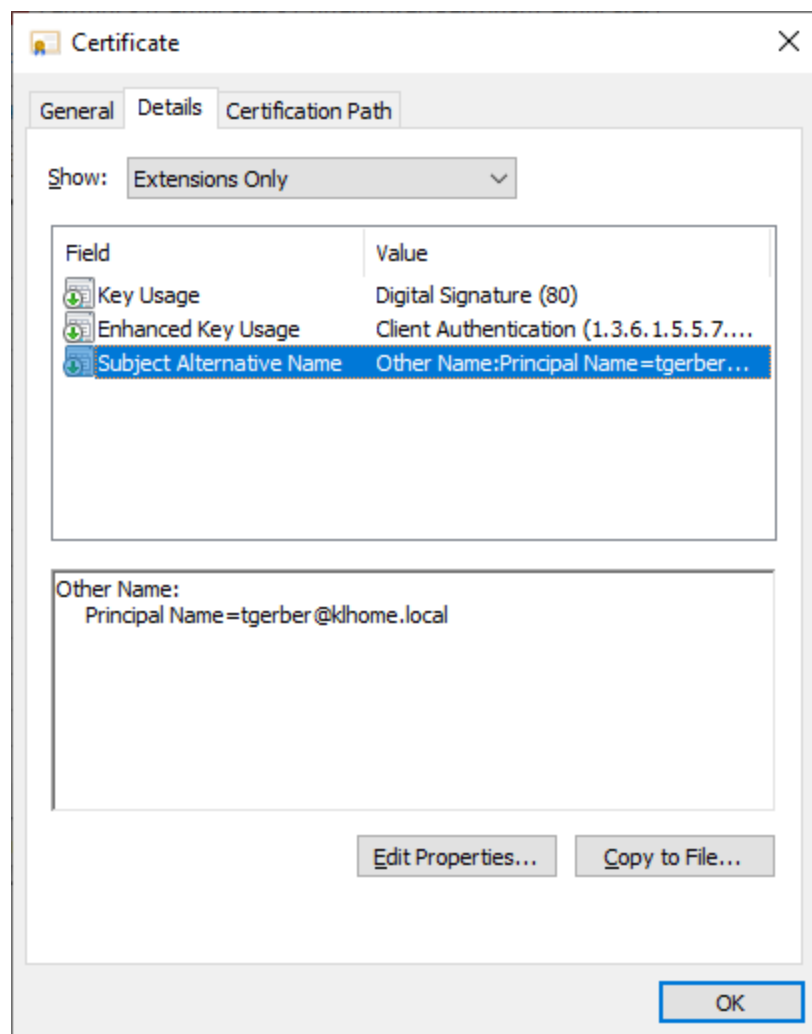

A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

Principal name with LDAP integration

In this method, the PKI user setting references an LDAP server. When `ldap-mode` is set to `principal-name`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set ldap-server "WIN2K16-KLHOME-LDAPS"
        set ldap-mode principal-name
    next
end
```

The matching certificate looks like the following:

This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.

Certificate management

Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company's private certificate authority (CA) is used to generate and sign all the certificates, the following certificates are needed:

Certificate type	Description
Server certificate	The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.
User certificate	The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.
CA certificate	The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.

Example

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.

The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company's Active Directory.

There are five major steps to configure this example:

1. [Importing the certificates](#)
2. [Configuring user authentication](#)
3. [Configuring the VPN](#)
4. [Configuring FortiClient and the endpoints](#)
5. [Testing and verifying the certificate authentication](#)

Importing the certificates

The server certificate and CA certificate need to be imported into the FortiGate.

To import the server certificate:

1. Go to *System > Certificates* and select *Import > Local Certificate*.
2. For *Type*, select *PKCS #12 Certificate*.
3. Upload the key file exported from the CA and enter the password.
4. Click *OK*. The certificate now appears in the *Local Certificate* section.

To import the CA certificate:

1. Go to *System > Certificates* and select *Import > CA Certificate*.
2. For *Type*, select *File*.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click *OK*. The certificate now appears in the *Remote CA Certificate* section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA's certificate):

```
config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set subject "CN=tgerber"
  next
end
```

For an example of CN field matching, see [Common name verification](#).

2. Create additional users as needed.
3. Place the users into a peer group:

```
config user peergrp
  edit "pki-users"
    set member "tgerber" <user> ... <user>
  next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *****
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set ldap-server "WIN2K16-KLHOME-LDAPS"
        set ldap-mode principal-name
    next
end
```

3. Place the user into a peer group:

```
config user peergrp
    edit "pki-ldap"
        set member "ldap-peer"
    next
end
```

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:

- Go to *Policy & Objects > Addresses* and click *Create New > Address*.
- For *Name*, enter *remote-user-range*.
- For *Type*, select *IP Range* and enter *172.18.200.10-172.18.200.99* in the *IP Range* field.
- Click *OK*.

2. Create the address subnet for the destination 192.168.20.0/24:

- Click *Create New > Address*.
- For *Name*, enter *192.168.20.0*.
- For *Type*, select *Subnet* and enter *192.168.20.0/24* in the *IP/Netmask* field.
- Click *OK*.

To configure the IPsec dialup tunnel:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Tunnel*.
2. Enter a name for the tunnel, *Dialup-cert_0*.
3. For *Template type*, select *Custom* then click *Next*.
4. In the *Network* section, enter the following:

Remote Gateway	<i>Dialup User</i>
Interface	<i>port1</i>
Mode Config	Enable
Assign IP From	<i>Range</i>
IPv4 mode config > Client Address Range	<i>172.18.200.10-172.18.200.99</i>
Enable IPv4 Split Tunnel	Enable
Accessible Networks	<i>192.168.20.0</i>

5. In the *Authentication* section, enter the following:

Method	<i>Signature</i>
Certificate Name	Select the server certificate that was imported.
Mode	<i>Aggressive</i>
Peer Options > Accept Types	<i>Peer certificate group</i>
Peer Options > Peer certificate group	Select the group based on the preferred method: <ul style="list-style-type: none"> • For subject verification, select <i>pki-users</i>. • For LDAP integration, select <i>pki-ldap</i>.

When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.

6. For *Phase 2 Selectors*, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Enter a policy name.
Incoming interface	<i>Dialup-cert_0</i>
Outgoing Interface	<i>port3</i>
Source	<i>remote-user-range</i>
Destination	<i>192.168.20.0</i>

Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>

3. Configure the other settings as needed.
4. Click *OK*.

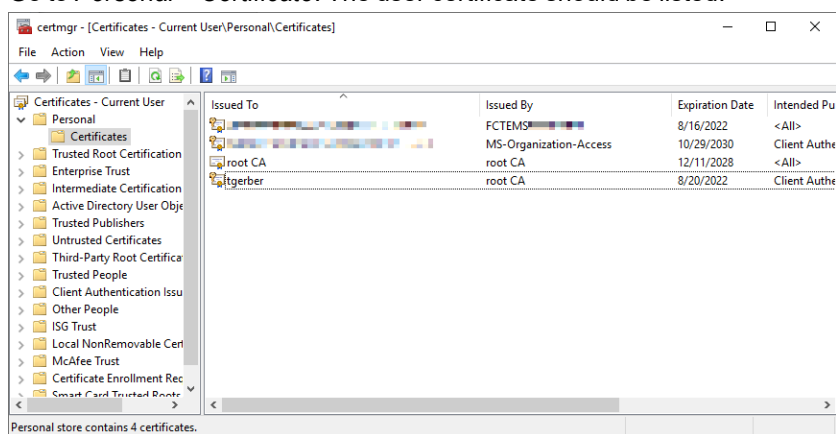

Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.

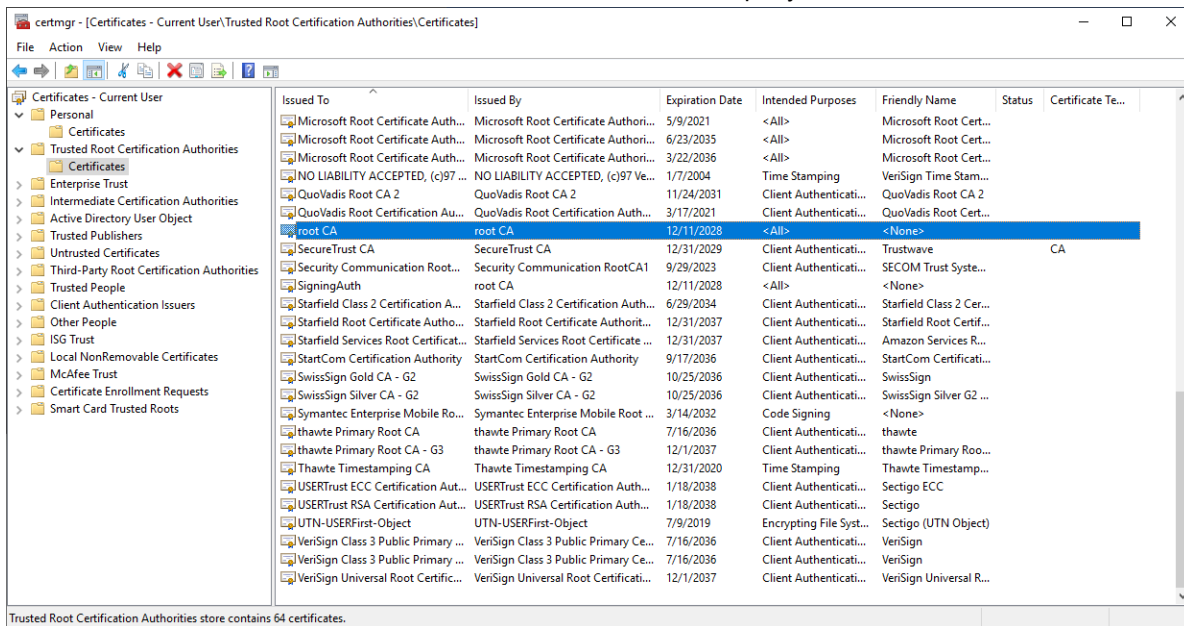

The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
 - a. In the Control Panel, type *Manage user certificate* in the search box.
 - b. Click the result, *Manage user certificates*.
2. Go to *Personal > Certificate*. The user certificate should be listed.

3. Go to *Trusted Root Certification Authorities > Certificates*. The company CA certificate should be listed.

To configure the FortiClient endpoint settings:

- In FortiClient, click the *Remote Access* tab and add a new connection:
 - If there are no existing connections, click *Configure VPN*.
 - If there are existing connections, click the menu icon and select *Add a new connection*.
- Configure the following:

VPN	<i>IPsec VPN</i>
Connection Name	<i>Dialup-cert_0</i>
Remote Gateway	<i>192.168.2.5</i>
Authentication Method	<i>X.509 Certificate</i> Select the user certificate, <i>tgerber/root CA</i> , from the dropdown.
Authentication (XAuth)	<i>Disable</i>

- Click *Save*.

Testing and verifying the certificate authentication

- On the client PC, open FortiClient and click the *Remote Access* tab.
- Select the VPN tunnel, *Dialup-cert_0*, and click *Connect*.
If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
- On the FortiGate, go to *Dashboard > Network* and locate the *IPsec* widget to view the VPN tunnel monitor. Click the widget to expand to full view.
The widget displays tunnel information, including the *Peer ID* containing the subject field of the user certificate.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
Dialup-cert_0	192.168.2.1	C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber	448 B	0 B	Dialup-cert_0	Dialup-cert
MPLS	10.10.10.1		4.28 GB	5.93 GB	MPLS	MPLS
vpn2Site1	192.168.2.1		0 B	0 B	vpn2Site1	vpn2Site1

4. Go to **Log & Report > System Events** and select the **VPN Events** card. Several tunnel related logs are recorded.

5. The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700"
logid="0101037138" type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec
connection status changed" msg="IPsec connection status change" action="tunnel-up"
remip=192.168.2.1 locip=192.168.2.5 remport=64916 locport=4500 outintf="port1"
cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C = CA, ST = British Columbia, L =
Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-ldap" useralt="C = CA, ST =
British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" xauthuser="N/A"
xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0" tunnelip=172.18.200.10
tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvbyte=0 nextstat=0
```

6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -1
# diagnose debug application fnbamd -1
# diagnose debug enable
```

Aggregate and redundant VPN

The following topics provide instructions on configuring aggregate and redundant VPNs:

- [Manual redundant VPN configuration on page 1890](#)
- [OSPF with IPsec VPN for network redundancy on page 1894](#)
- [IPsec VPN in an HA environment on page 1901](#)
- [Packet distribution and redundancy for aggregate IPsec tunnels on page 1906](#)
- [Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 1917](#)
- [Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 1922](#)
- [Packet distribution for aggregate IPsec tunnels using weighted round robin on page 1926](#)
- [Redundant hub and spoke VPN on page 1928](#)

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology

The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.
3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.

6. Repeat these steps for the remaining paths.

a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network > Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All
Destination	All

Schedule	Always
Service	All
Action	ACCEPT

- c. Click *OK*.
- d. Click *Create New* and configure the policy for the other direction of traffic:

Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

- e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.

2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
  edit main_vpn
    set dpd on-demand
    set interface port1
    set natTraversal enable
    set psksecret *****
    set remote-gw 192.168.10.8
    set type static
  next
  edit backup_vpn
    set dpd on-demand
    set interface port2
    set monitor main_vpn
    set natTraversal enable
    set psksecret *****
    set remote-gw 192.168.10.8
    set type static
  next
end
```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.

Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.

a. Configure HQ1.

```
config system interface
  edit "port1"
    set alias to_ISP1
    set ip 172.16.200.1 255.255.255.0
  next
  edit "port2"
    set alias to_ISP2
    set ip 172.17.200.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.3
    set device "port1"
  next
  edit 2
    set gateway 172.17.200.3
    set device "port2"
    set priority 100
  next
end
```

b. Configure HQ2.

```
config system interface
  edit "port25"
    set alias to_ISP1
    set ip 172.16.202.1 255.255.255.0
  next
  edit "port26"
    set alias to_ISP2
    set ip 172.17.202.1 255.255.255.0
  next
end
```

```

end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port25"
  next
  edit 2
    set gateway 172.17.202.2
    set device "port26"
    set priority 100
  next
end

```

2. Configure the internal (protected subnet) interface.

a. Configure HQ1.

```

config system interface
  edit "dmz"
    set ip 10.1.100.1 255.255.255.0
  next
end

```

b. Configure HQ2.

```

config system interface
  edit "port9"
    set ip 172.16.101.1 255.255.255.0
  next
end

```

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.

a. Configure HQ1.

```

config vpn ipsec phase1-interface
  edit "pri_HQ2"
    set interface "port1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample1
  next
  edit "sec_HQ2"
    set interface "port2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.202.1
    set psksecret sample2
  next
end
config vpn ipsec phase2-interface
  edit "pri_HQ2"
    set phase1name "pri_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
      aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
  edit "sec_HQ2"
    set phase1name "sec_HQ2"

```

```

        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

b. Configure HQ2.

```

config vpn ipsec phase1-interface
    edit "pri_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample1
    next
    edit "sec_HQ1"
        set interface "port26"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.17.200.1
        set psksecret sample2
    next
end
config vpn ipsec phase2-interface
    edit "pri_HQ1"
        set phase1name "pri_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "sec_HQ1"
        set phase1name "sec_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel.

a. Configure HQ1.

```

config firewall policy
    edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "pri_outbound"
        set srcintf "dmz"
        set dstintf "pri_HQ2"
        set srcaddr "10.1.100.0"
    next
end

```

```
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 4
        set name "sec_outbound"
        set srcintf "dmz"
        set dstintf "sec_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "pri_outbound"
        set srcintf "port9"
        set dstintf "pri_HQ1"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
```

```

next
edit 4
    set name "sec_outbound"
    set srcintf "port9"
    set dstintf "sec_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

```

5. Assign an IP address to the IPsec tunnel interface.

a. Configure HQ1.

```

config system interface
    edit "pri_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
    edit "sec_HQ2"
        set ip 10.10.11.1 255.255.255.255
        set remote-ip 10.10.11.2 255.255.255.255
    next
end

```

b. Configure HQ2.

```

config system interface
    edit "pri_HQ1"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
    edit "sec_HQ1"
        set ip 10.10.11.2 255.255.255.255
        set remote-ip 10.10.11.1 255.255.255.255
    next
end

```

6. Configure OSPF.

a. Configure HQ1.

```

config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
    next
end
config ospf-interface
    edit "pri_HQ2"
        set interface "pri_HQ2"
        set cost 10
        set network-type point-to-point
    next
    edit "sec_HQ2"
        set interface "sec_HQ2"
        set cost 20
        set network-type point-to-point
    next
end
config network

```

```

        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.11.0 255.255.255.0
        next
        edit 3
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end

```

b. Configure HQ2.

```

config router ospf
    set router-id 2.2.2.2
    config area
        edit 0.0.0.0
        next
    end
    config ospf-interface
        edit "pri_HQ1"
            set interface "pri_HQ1"
            set cost 10
            set network-type point-to-point
        next
        edit "sec_HQ1"
            set interface "sec_HQ1"
            set cost 20
            set network-type point-to-point
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.11.0 255.255.255.0
        next
        edit 3
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end

```

To check VPN and OSPF states using diagnose and get commands:

1. Run the HQ1 # diagnose vpn ike gateway list command. The system should return the following:

```

vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500

```

3. Run the HQ1 # get router info ospf neighbor command. The system should return the following:

```

OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2

```

4. Run the HQ1 # `get router info routing-table ospf` command. The system should return the following:
 Routing table for VRF=0
 O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
 In case the primary tunnel is down after route convergence.
5. Run the HQ1 # `get router info routing-table ospf` command. The system should return the following:
 Routing table for VRF=0
 O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.

You can configure IPsec VPN in an HA environment using the [GUI](#) or [CLI](#).

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
 - a. Go to **VPN > IPsec Wizard** and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, set *No NAT between sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. In the *IP address* field, enter *172.16.202.1*.
 - iii. For *Outgoing Interface*, select *port1*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter an example key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0/24*.

- iii. Configure the *Remote Subnets* as 172.16.101.0/24.
 - iv. Click *Create*.
- 2. Set up IPsec VPN on HQ2:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, set *No NAT between sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. In the *IP address* field, enter 172.16.200.1.
 - iii. For *Outgoing Interface*, select port13.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter an example key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is port9.
 - ii. Configure the *Local Subnets* as 172.16.101.0.
 - iii. Configure the *Remote Subnets* as 10.1.100.0
 - iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:

```
config system ha
  set group-name "FGT-HA"
  set mode a-p
  set password sample
  set hbdev "wan1" 50 "wan2" 50
  set session-pickup enable
  set priority 200
  set override-wait-time 10
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
a. Configure HQ1:
config system interface
  edit "port1"
    set vdom "root"
    set ip 172.16.200.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.3
    set device "port1"
  next
```

```
end
```

b. Configure HQ2:

```
config system interface
  edit "port25"
    set vdom "root"
    set ip 172.16.202.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port25"
  next
end
```

3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

a. Configure HQ1:

```
config system interface
  edit "dmz"
    set vdom "root"
    set ip 10.1.100.1 255.255.255.0
  next
end
```

b. Configure HQ2:

```
config system interface
  edit "port9"
    set vdom "root"
    set ip 172.16.101.1 255.255.255.0
  next
end
```

4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.

a. Configure HQ1:

```
config vpn ipsec phase1-interface
  edit "to_HQ2"
    set interface "port1"
    set peertype any
    set net-device enable
    set ha-sync-esp-seqno enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample
  next
end
```

b. Configure HQ2:

```
config vpn ipsec phase1-interface
  edit "to_HQ1"
    set interface "port25"
    set peertype any
    set net-device enable
    set ha-sync-esp-seqno enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set psksecret sample
  next
```

5. Configure the IPsec phase2-interface:**a. Configure HQ1:**

```
config vpn ipsec phase2-interface
edit "to_HQ2"
set phase1name "to_HQ2"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
set auto-negotiate enable
next
end
```

b. Configure HQ2:

```
config vpn ipsec phase2-interface
edit "to_HQ1"
set phase1name "to_HQ1"
set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
set auto-negotiate enable
next
end
```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.**a. Configure HQ1:**

```
config router static
edit 2
set dst 172.16.101.0 255.255.255.0
set device "to_HQ2"
next
edit 3
set dst 172.16.101.0 255.255.255.0
set blackhole enable
set distance 254
next
end
```

b. Configure HQ2:

```
config router static
edit 2
set dst 10.1.100.0 255.255.255.0
set device "to_HQ1"
next
edit 3
set dst 10.1.100.0 255.255.255.0
set blackhole enable
set distance 254
next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:**a. Configure HQ1:**

```
config firewall policy
edit 1
set name "inbound"
set srcintf "to_HQ2"
set dstintf "dmz"
set srcaddr "172.16.101.0"
set dstaddr "10.1.100.0"
set action accept
```

```

        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

b. Configure HQ2:

```

config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

- 8. Use the following diagnose commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish.**

a. Run the HQ1 # diagnose vpn ike gateway list command. The system should return the following:

```

vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago

```

Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).

Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. [Create the IPsec tunnels.](#)
2. [Create the IPsec aggregate.](#)
3. [Configure the firewall policies.](#)
4. [Configure the aggregate VPN interface IPs.](#)
5. [Configure OSPF.](#)

To create the IPsec tunnels:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter *pri_HQ2* and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named *sec_HQ2* with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter *agg_HQ2*.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ2* and *sec_HQ2*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
------	----------

Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit *agg_HQ2*.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network > OSPF*.
2. For *Router ID*, enter 1.1.1.1.
3. In the *Areas* table, click *Create New*.
 - a. For *Area ID*, enter 0.0.0.0.
 - b. Click *OK*.
4. In the *Networks* table, click *Create New*.
 - a. Set the *Area* to 0.0.0.0.
 - b. For *IP/Netmask*, enter 10.1.100.0/24.
 - c. Click *OK*.
 - d. Click *Create New*.
 - e. For *IP/Netmask*, enter 10.10.10.0/24.
 - f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. [Create the IPsec tunnels.](#)
2. [Create the IPsec aggregate.](#)
3. [Configure the firewall policies.](#)
4. [Configure the aggregate VPN interface IPs.](#)
5. [Configure OSPF.](#)

To create the IPsec tunnels:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter *pri_HQ1* and click *Next*.

3. Enter the following:

Phase 1	
IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.

5. Click **OK**.6. Create another tunnel named `sec_HQ1` with the following settings:

Phase 1	
IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to **VPN > IPsec Tunnels** and click **Create New > IPsec Aggregate**.
2. For **Name**, enter `agg_HQ1`.
3. Select a load balancing algorithm.
4. From the **Tunnel** dropdown, select the tunnels that you created previously (`pri_HQ1` and `sec_HQ1`). If required, enter weights for each tunnel.
5. Click **OK**.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9
Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit *agg_HQ1*.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network > OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
 - a. For *Area ID*, enter 0.0.0.0.
 - b. Click *OK*.

4. In the *Networks* table, click *Create New*.
 - a. Set the *Area* to *0.0.0.0*.
 - b. For *IP/Netmask*, enter *172.16.101.0/24*.
 - c. Click *OK*.
 - d. Click *Create New*.
 - e. For *IP/Netmask*, enter *10.10.10.0/24*.
 - f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard > Network*, hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. [Configure the interfaces.](#)
2. [Configure two IPsec phase 1 and phase 2 interfaces.](#)
3. [Configure the IPsec aggregate.](#)
4. [Configure the firewall policies.](#)
5. [Configure the aggregate VPN interface IPs.](#)
6. [Configure OSPF.](#)

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
  edit "pri_HQ2"
    set interface "port1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample1
  next
  edit "sec_HQ2"
    set interface "port2"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.202.1
    set psksecret sample2
  next
```

```
end
config vpn ipsec phase2-interface
edit "pri_HQ2"
    set phase1name "pri_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
        chacha20poly1305
    set auto-negotiate enable
next
edit "sec_HQ2"
    set phase1name "sec_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
        chacha20poly1305
    set auto-negotiate enable
next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
edit "agg_HQ2"
    set member "pri_HQ2" "sec_HQ2"
next
end
```

To configure the firewall policies:

```
config firewall policy
edit 1
    set name "inbound"
    set srcintf "agg_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "agg_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
edit "agg_HQ2"
    set ip 10.10.10.1 255.255.255.255
    set remote-ip 10.10.10.2 255.255.255.255
next
end
```

To configure OSPF:

```
config router ospf
  set router-id 1.1.1.1
  config area
    edit 0.0.0.0
    next
  end
  config network
    edit 1
      set prefix 10.1.100.0 255.255.255.0
    next
    edit 2
      set prefix 10.10.10.0 255.255.255.0
    next
  end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. [Configure the interfaces.](#)
2. [Configure two IPsec phase 1 and phase 2 interfaces.](#)
3. [Configure the IPsec aggregate.](#)
4. [Configure the firewall policies.](#)
5. [Configure the aggregate VPN interface IPs.](#)
6. [Configure OSPF.](#)

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
  edit "pri_HQ1"
    set interface "port25"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set psksecret sample1
  next
  edit "sec_HQ1"
    set interface "port26"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.200.1
    set psksecret sample2
  next
end
```

```
config vpn ipsec phase2-interface
edit "pri_HQ1"
    set phase1name "pri_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
        chacha20poly1305
    set auto-negotiate enable
next
edit "sec_HQ1"
    set phase1name "sec_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
        chacha20poly1305
    set auto-negotiate enable
next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
edit "agg_HQ1"
    set member "pri_HQ1" "sec_HQ1"
next
end
```

To configure the firewall policies:

```
config firewall policy
edit 1
    set name "inbound"
    set srcintf "agg_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "agg_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
edit "agg_HQ1"
    set ip 10.10.10.2 255.255.255.255
    set remote-ip 10.10.10.1 255.255.255.255
next
end
```

To configure OSPF:

```

config router ospf
  set router-id 2.2.2.2
  config area
    edit 0.0.0.0
    next
  end
  config network
    edit 1
      set prefix 172.16.101.0 255.255.255.0
    next
    edit 2
      set prefix 10.10.10.0 255.255.255.0
    next
  end
end

```

Monitoring the traffic in the CLI**To view debugging information:****1. Verify the status of the phase 1 IKE SAs:**

```

# diagnose vpn ike gateway list
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms

  dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432

```

3. Debug the IPsec aggregation list:

```

# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
  pri_HQ2
  sec_HQ2

```

4. Verify the OSPF neighbor information:

```

# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2

```

5. Verify the OSPF routing table:

```

# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43

```

Packet distribution for aggregate dial-up IPsec tunnels using location ID

To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.

To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
  edit "client1"
    set interface "port1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.4
    set psksecret *****
  next
  edit "client2"
    set interface "wan1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 173.1.1.1
    set psksecret *****
  next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
  edit "agg1"
    set member "client1" "client2"
  next
end
```

3. Configure the location ID:

```
config system settings
  set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):**1. Configure the IPsec tunnels:**

```
config vpn ipsec phase1-interface
    edit "server1"
        set type dynamic
        set interface "mgmt1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret *****
        set dpd-retryinterval 60
    next
    edit "server2"
        set type dynamic
        set interface "port27"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret *****
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```

        set schedule "always"
        set service "ALL"
    next
end

```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```

FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0

```

2. List the IPsec aggregate members:

```

# diagnose sys ipsec-aggregate list
server
members(3):
  server1_1
  server1_0
  server2_0

```

3. In the GUI, go to *Dashboard > Network* and expand the *IPsec* widget to review the traffic distributed over the aggregate members:

IPsec						
Reset Statistics Bring Up Bring Down Locate on VPN Map						
Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
IPsec Aggregate 2						
server2_0	11.101.1.1		2.11 MB	1.34 MB	server2_0	server2
server1_0	172.16.200.1		2.15 MB	1.19 MB	server1_0	server1
server1_1	172.16.200.3		0 B	0 B	server1_1	server1

Updated: 14:12:20

Packet distribution for aggregate static IPsec tunnels in SD-WAN

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an `ipsec-aggregate` interface is created and added as an SD-WAN member.

Configuring FortiGate 1

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
  edit "vd1-p1"
    set interface "wan1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 172.16.201.2
    set psksecret ftnt1234
  next
  edit "vd1-p2"
    set interface "wan2"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 172.16.202.2
    set psksecret ftnt1234
```

```
        next
    end

    config vpn ipsec phase2-interface
        edit "vd1-p1"
            set phaselname "vd1-p1"
        next
        edit "vd1-p2"
            set phaselname "vd1-p2"
        next
    end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "aggl"
        set member "vd1-p1" "vd1-p2"
        set algorithm L3
    next
end

config system interface
    edit "aggl"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.2 255.255.255.255
    end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "aggl"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end

config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phase1name "vd2-p1"
    next
    edit "vd2-p2"
        set phase1name "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end

config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
```

```

        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To configure SD-WAN:

```

config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg2"
            set gateway 172.16.11.1
        next
    end
end

```

Related diagnose commands

To display aggregate IPsec members:

```

# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
    vd1-p1
    vd1-p2

```

To check the VPN status:

```

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

Packet distribution for aggregate IPsec tunnels using weighted round robin

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.

To create the IPsec aggregate in the GUI:

1. Go to **VPN > IPsec Tunnels** and click **Create New > IPsec Tunnel**.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that **Aggregate member** is **Enabled** for each tunnel under the **Network > Advanced** section.
3. Go to **VPN > IPsec Tunnels** and click **Create New > IPsec Aggregate**.
4. Enter a name for the aggregate, such as *agg1*, and ensure that **Algorithm** is **Weighted Round Robin**.
5. Add *tunnel1* as an aggregate members, and set **Weight** to 10.

6. Add *tunnel2* as a second aggregate members, and set its *Weight* to 20.

7. Click **OK**.
8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
agg1						
tunnel1	172.16.200.1		3.07 MB	36.83 MB	tunnel1	tunnel1
tunnel2	172.16.31.2		6.16 MB	73.66 MB	tunnel2	tunnel2

To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

```
config vpn ipsec phase1-interface
    edit "tunnel1"
        ...
        set aggregate-member enable
        set aggregate-weight 10
        ...
    next
    edit "tunnel2"
        ...
        set aggregate-member enable
        set aggregate-weight 20
        ...
    next
end
```

2. Create the IPsec aggregate:

```
config system ipsec-aggregate
    edit "agg1"
        set member "tunnel1" "tunnel2"
        set algorithm weighted-round-robin
    next
end
```

Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.

a. Configure the WAN, internal interface, and static route.

```

config system interface
    edit "port13"
        set alias "WAN"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port13"
    next
end

```

b. Configure the IPsec phase1-interface and phase2-interface.

```

config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port13"
    next
end

```

```

        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
    next
end

```

c. Configure the firewall policy.

```

config firewall policy
    edit 1
        set name "spoke-hub"
        set srcintf "hub"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke-spoke"
        set srcintf "hub"
        set dstintf "hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route.

i. Configure Spoke1.

```

config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "wan1"
        set mode dhcp
        set distance 10
        set priority 100
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1

```

```
        set gateway 172.16.200.2
        set device "port1"
    next
end
```

ii. Configure Spoke2.

```
config system interface
    edit "wan1"
        set ip 172.16.200.3 255.255.255.0
    next
    edit "wan2"
        set mode dhcp
        set distance 10
        set priority 100
    next
    edit "lan1"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.2
        set device "wan1"
    next
end
```

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

```
config vpn ipsec phase1-interface
    edit "primary"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
    edit "secondary"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set monitor "primary"
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "primary"
        set phaselname "primary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
    edit "secondary"
        set phaselname "secondary"
```

```

        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end

```

ii. Configure Spoke2.

```

config vpn ipsec phase1-interface
    edit "primary"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
    edit "secondary"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set monitor "primary"
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "primary"
        set phase1name "primary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
    edit "secondary"
        set phase1name "secondary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end

```

c. Configure the firewall policy.

i. Configure Spoke1.

```

config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "primary" "secondary"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

ii. Configure Spoke2.

```

config firewall policy
  edit 1
    set srcintf "lan1"
    set dstintf "primary" "secondary"
    set srcaddr "192.168.4.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

d. Configure the static route.**i. Configure Spoke1.**

```

config router static
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set distance 1
    set device "primary"
  next
  edit 4
    set dst 172.16.101.0 255.255.255.0
    set distance 3
    set device "secondary"
  next
end

```

ii. Configure Spoke2.

```

config router static
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set distance 1
    set device "primary"
  next
  edit 4
    set dst 172.16.101.0 255.255.255.0
    set distance 3
    set device "secondary"
  next
end

```

3. Run diagnose and get commands.**a. Run the Spoke1 # diagnose vpn tunnel list command. The system should return the following:**

```

```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

- [IPsec VPN wizard hub-and-spoke ADVPN support on page 1933](#)
- [ADVPN with BGP as the routing protocol on page 1937](#)
- [ADVPN with OSPF as the routing protocol on page 1947](#)
- [ADVPN with RIP as the routing protocol on page 1956](#)
- [UDP hole punching for spokes behind NAT on page 1964](#)

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

This example shows the configuration of a hub with two spokes.

To configure the hub:

- 1. Go to *VPN > IPsec Wizard*.
- 2. Go through the steps of the wizard:
 - a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub

VPN Creation Wizard

1 VPN Setup 2 Authentication 3 Tunnel Interface 4 Policy & Routing 5 Review Settings

Name:

Template type: Site to Site | **Hub-and-Spoke** | Remote Access | Custom

Role: **Hub** | Spoke

The Hub-and-Spoke VPN will be set up using auto-discovery with BGP as the routing protocol.

Hub-and-Spoke - FortiGate (Hub)

Spoke Easy Configuration

These configuration key(s) are meant for one-time use to automatically configure some of the VPN tunnel settings on your spoke FortiGates.

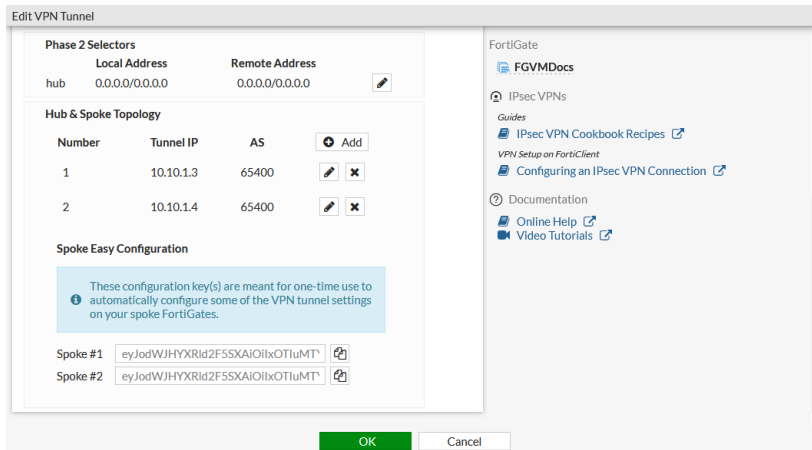

Spoke #1: eyJodWJHYXRld2F5SXAiOiIxOTIu

Spoke #2: eyJodWJHYXRld2F5SXAiOiIxOTIu

Add Another Show Tunnel List

4. Click *Show Tunnel List* to go to *VPN > IPsec Tunnels*.

5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.

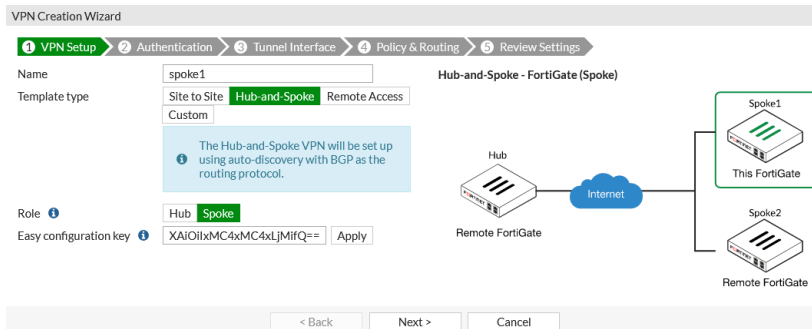

To configure the spokes:

1. Go to **VPN > IPsec Wizard**.
2. On the **VPN Setup** page of the wizard, enter the following:

Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the **Easy configuration key** field, paste the **Spoke #1** key from the hub FortiGate, click **Apply**, then click **Next**.

4. Adjust the **Authentication** settings as required, enter the **Pre-shared key**, then click **Next**.
5. Adjust the **Tunnel Interface** settings as required, then click **Next**.
6. Configure the **Policy & Routing** settings, then click **Next**:

Local interface	wan2
Local subnets	10.1.100.0/24

VPN Setup Authentication Tunnel Interface **Policy & Routing** Review Settings

Local AS: 65400

Local interface: wan2

Local subnets: 10.1.100.0/24

Hub #1 tunnel IP: 10.10.1.1

Hub-and-Spoke - FortiGate (Spoke)

< Back Next > Cancel

- Review the settings, then click *Create*.
- The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
- Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

- On the hub FortiGate, go to *Dashboard > Network* and expand the IPsec widget. The tunnels to the spokes are established.

IPsec						
Reset Statistics Bring Up Bring Down Locate on VPN Map						
Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
Hub-and-Spoke - FortiGate (Hub)						
hub_0	172.16.200.1		10.97 kB	5.34 kB	hub_0	hub
hub_1	172.16.200.3		3.51 kB	1.81 kB	hub_1	hub

- On a spoke, go to *Dashboard > Network* and expand the IPsec widget. The tunnel to the hub and the spoke to spoke shortcut are established.

IPsec						
Reset Statistics Bring Up Bring Down Locate on VPN Map						
Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
Hub-and-Spoke - FortiGate (Spoke)						
spoke1	172.16.200.4		120 B	5.19 kB	spoke1	spoke1
spoke1_0	172.16.200.3		1.85 MB	1.07 MB	spoke1_0	spoke1

ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.

To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```

config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end

```

2. Configure the hub FortiGate:

- a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```

config vpn ipsec phase1-interface
  edit "advpn-hub"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
    3des-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-sender enable
    set psksecret sample
    set dpd-retryinterval 5
  next
end

```

```

config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
    next
end

```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```

config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```

config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end

```

d. Configure the hub FortiGate's BGP:

```

config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65412
            set route-reflector-client enable
        next
    end
end

```

```

    config neighbor-range
        edit 1
            set prefix 10.10.10.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end

```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```

config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end

```

ii. Configure the Spoke2:

```

config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end

```

```

end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end

```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```

config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

ii. Configure Spoke2:

```

config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

```

    next
  edit 2
    set name "inbound_advpn"
    set srcintf "spoke1" "spoke1_backup"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

ii. Configure Spoke2:

```

config firewall policy
  edit 1
    set name "outbound_advpn"
    set srcintf "internal"
    set dstintf "spoke2" "spoke2_backup"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "inbound_advpn"
    set srcintf "spoke2" "spoke2_backup"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```

config system interface
  edit "spoke1"
    set ip 10.10.10.1 255.255.255.255
    set remote-ip 10.10.10.254 255.255.255.0
  next
  edit "spoke1_backup"
    set ip 10.10.10.2 255.255.255.255
    set remote-ip 10.10.10.254 255.255.255.0
  next
end

```

ii. Configure Spoke2:

```

config system interface
  edit "spoke2"
    set ip 10.10.10.3 255.255.255.255
    set remote-ip 10.10.10.254 255.255.255.0
  next
end

```

```

    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```

config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end

```

ii. Configure Spoke2:

```

config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end

```

4. Run diagnose and get commands on Spoke1 to check VPN and BGP states:

a. Run the diagnose vpn tunnel list command on Spoke1. The system should return the following:

```

list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=1 olast=1 ad=r/2

```

- e. Run the `get router info routing-table bgp` command. The system should return the following:

```

Routing table for VRF=0
B      172.16.101.0/24 [200/0] via 10.10.10.254, spokel, 00:23:57
B      192.168.4.0/24 [200/0] via 10.10.10.3, spokel_0 , 00:22:03

```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.

To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```

config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end

```

2. Configure the hub FortiGate:

- a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```

config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
    next
end

```

```

        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end

```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```

config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```

config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end

```

d. Configure the hub FortiGate's OSPF:

```

config router ospf
  set router-id 1.1.1.1
  config area
    edit 0.0.0.0
    next
  end
  config network
    edit 1
      set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
      set prefix 172.16.101.0 255.255.255.0
    next
  end
end

```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```

config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 15.1.1.2 255.255.255.0
  next
  edit "wan2"
    set alias "secondary_WAN"
    set ip 12.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 12.1.1.1
    set device "wan2"
    set distance 15
  next
  edit 2
    set gateway 15.1.1.1
    set device "wan1"
  next
end

```

ii. Configure the Spoke2:

```

config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 13.1.1.2 255.255.255.0
  next
  edit "wan2"
    set alias "secondary_WAN"
    set ip 17.1.1.2 255.255.255.0
  next
end

```

```

edit "internal"
    set ip 192.168.4.1 255.255.255.0
next
end
config router static
edit 1
    set gateway 17.1.1.1
    set device "wan2"
    set distance 15
next
edit 2
    set gateway 13.1.1.1
    set device "wan1"
next
end

```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```

config vpn ipsec phase1-interface
edit "spoke1"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 22.1.1.1
    set psksecret sample
    set dpd-retryinterval 5
next
edit "spoke1_backup"
    set interface "wan2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 22.1.1.1
    set monitor "spoke1"
    set psksecret sample
    set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
edit "spoke1"
    set phase1name "spoke1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
    set auto-negotiate enable
next
edit "spoke1_backup"
    set phase1name "spoke1_backup"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305

```

```

        set auto-negotiate enable
    next
end

```

ii. Configure Spoke2:

```

config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"

```

```

        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

ii. Configure Spoke2:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```

config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

ii. Configure Spoke2:

```

config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```

config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
    next
end
config network
    edit 1
        set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
        set prefix 10.1.100.0 255.255.255.0
    next
end
end

```

ii. Configure Spoke2:

```

config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
    next
end
config network
    edit 1
        set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
        set prefix 192.168.4.0 255.255.255.0
    next
end
end

```

4. Run diagnose and get commands on Spoke1 to check VPN and OSPF states:

a. Run the diagnose vpn tunnel list command on Spoke1. The system should return the following:

```

list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0

```

- b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:**

```

OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1.
Full/ - 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1

```

- c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:**

```

Routing table for VRF=0
O      172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O      192.168.4.0/24  [110/110] via 10.10.10.254, spoke1, 00:22:35

```

- d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:**

```

list all ipsec tunnel in vd 0
----
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

- e. Run the `get router info routing-table ospf` command. The system should return the following:

```

Routing table for VRF=0
O      172.16.101.0/24 [110/110] via 10.10.10.254, spokel, 00:27:14
O      192.168.4.0/24  [110/110] via 10.10.10.3, spokel_0, 00:26:26

```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device` `disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status` `enable` must be run on the hub FortiGate.

To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```

config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end

```

2. Configure the hub FortiGate:

- a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```

config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
    next
end

```

```

        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end

```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```

config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```

config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end

```

d. Configure the hub FortiGate's RIP:

```
config router rip
    set default-information-originate enable
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
config interface
    edit "advpn-hub"
        set split-horizon-status disable
    next
end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
```

```

        next
        edit "internal"
            set ip 192.168.4.1 255.255.255.0
        next
    end
    config router static
        edit 1
            set gateway 17.1.1.1
            set device "wan2"
            set distance 15
        next
        edit 2
            set gateway 13.1.1.1
            set device "wan1"
        next
    end
end

```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```

config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256

```

```

aes128gcm aes256gcm chacha20poly1305
    set auto-negotiate enable
next
end

```

ii. Configure Spoke2:

```

config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
        aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"

```

```

        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

ii. Configure Spoke2:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```

config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

ii. Configure Spoke2:

```

config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```

config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end

```

ii. Configure Spoke2:

```

config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end

```

4. Run diagnose and get commands on Spoke1:

a. Run the diagnose vpn tunnel list command on Spoke1. The system should return the following:

```

list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

    src: 0:0:0:0:0/0:0:0:0:0
    dst: 0:0:0:0:0/0:0:0:0:0

```

- b. Run the `get router info rip database` command on Spoke1. The system should return the following:**

Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

Network	Next Hop	Metric From	If	Time
Rc 10.1.100.0/24		1.	internal	
Rc 10.10.10.2/32		1.	spoke1	
R 172.16.101.0/24	10.10.10.254	1. 10.10.10.254	spoke1	02:28
R 192.168.4.0/24	10.10.10.254	1. 10.10.10.254	spoke1	02:44

- c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:**

```

Routing table for VRF=0
R      172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R      192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38

```

- d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:**

```

list all ipsec tunnel in vd 0
----

- e. Run the `get router info routing-table rip` command. The system should return the following:

```

Routing table for VRF=0
R      172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R      192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02

```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.

To verify the ADVPN shortcut is established between both spokes behind NAT:

```

Fabric Overlay Orchestrator

The Fabric Overlay Orchestrator feature is an easy-to-use GUI wizard that simplifies the process of configuring a self-orchestrated SD-WAN overlay within a single Security Fabric. This feature is self-orchestrated since no additional tool or

device, aside from the FortiGates themselves, is required to orchestrate this configuration. An SD-WAN overlay configuration consists of IPsec and BGP configuration settings.

Currently, the Fabric Overlay Orchestrator supports a single hub architecture and builds upon an existing Security Fabric configuration. This feature configures the root FortiGate as the SD-WAN overlay hub and the downstream first-level FortiGates as the spokes.

After configuring the Fabric Overlay, you can complete the SD-WAN deployment by configuring SD-WAN rules.

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See [Configuring the root FortiGate and downstream FortiGates on page 2770](#) for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

This section contains the following topics:

- [Prerequisites on page 1968](#)
- [Network topology on page 1968](#)
- [Using the Fabric Overlay Orchestrator on page 1969](#)

Prerequisites

Create a single Fortinet Security Fabric with the following components:

- A root FortiGate and one or more downstream FortiGates all running FortiOS 7.2.4 or later
- A FortiAnalyzer, or cloud logging using FortiAnalyzer Cloud or FortiGate Cloud
 - For FortiGate Cloud, all downstream devices must belong to the same FortiCloud account

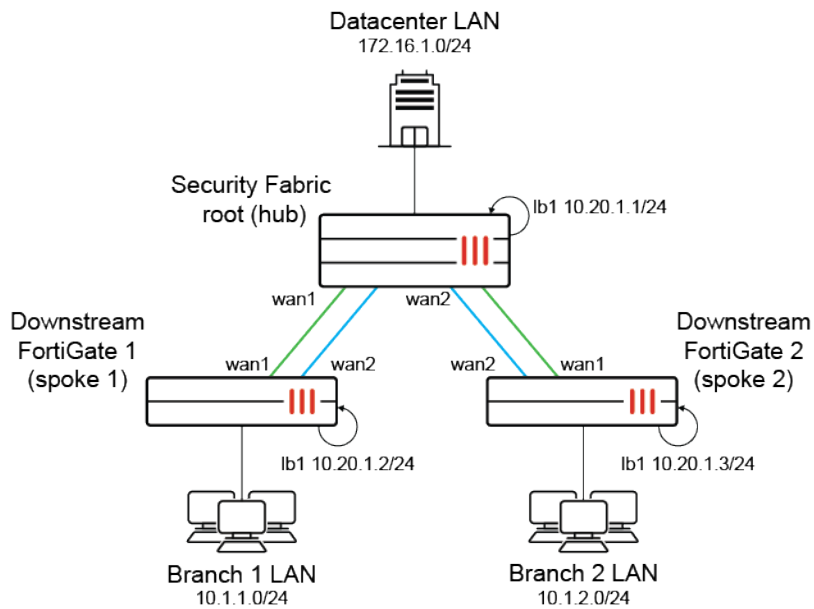

For more information about configuring these components, see [Configuring the root FortiGate and downstream FortiGates on page 2770](#), [Configuring FortiAnalyzer on page 2779](#), and [Configuring cloud logging on page 2782](#) in the Security Fabric chapter.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

Network topology

The Fabric Overlay Orchestrator supports configuring an overlay for the following example hub and spoke topology using ADVPN and a single hub.

This topology corresponds to the [single datacenter \(active-passive gateway\)](#) design using the [IPsec overlay](#) design of one-to-one overlay mapping per underlay. For more details on these topics, see the [SD-WAN Architectures for Enterprise](#) guide.

In this topology, the datacenter FortiGate (Security Fabric root FortiGate) is the hub, and the branch FortiGates (Security Fabric downstream FortiGates) are the spokes. Each FortiGate has a distinctly defined LAN subnet and loopback interface (lb1) with an IP address within the 10.20.1.0/24 subnet.

The Fabric Overlay Orchestrator creates loopbacks to act as health check servers that are always up, and they can be accessed by adjacent Fabric devices. When configuring the policy creation option of either automatic or health check on the hub, the Fabric Overlay Orchestrator configures performance SLAs from the hub to the health check servers on 10.20.1.2 and 10.20.1.3 corresponding to the spoke 1 and spoke 2 FortiGates respectively. Likewise, when the Fabric Overlay Orchestrator runs on each spoke, it creates a performance SLA to the hub using its loopback address of 10.20.1.1.

Instead of using loopbacks, any business-critical applications and resources connected to the LAN of each device can be used as health check servers for performance SLAs.

Using the Fabric Overlay Orchestrator

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See [Configuring the root FortiGate and downstream FortiGates on page 2770](#) for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

The following steps should be used to configure a self-orchestrated SD-WAN overlay within a single Security Fabric. These steps must be followed in order, and assume that the prerequisites and network topology are in place.

1. Configure the root FortiGate using the Fabric Overlay Orchestrator.
2. Configure one or more downstream FortiGates using the Fabric Overlay Orchestrator.
3. Configure an overlay on the spoke for an additional incoming interface on the hub (if applicable).
4. Verify the firewall policies on the hub FortiGate.
5. Verify the Fabric Overlay created by the Fabric Overlay Orchestrator:
 - a. Verify the IPsec VPN tunnels on the hub FortiGate.
 - b. Verify BGP routing on the hub FortiGate.
 - c. Verify the performance SLAs on the hub FortiGate.
 - d. Verify the firewall policies on a spoke FortiGate.
 - e. Verify the IPsec VPN tunnels on a spoke FortiGate.
 - f. Verify BGP routing on a spoke FortiGate.
 - g. Verify the performance SLAs on a spoke FortiGate.
 - h. Verify the spoke-to-spoke ADVPN communication.
6. Configure SD-WAN rules on the hub FortiGate.
7. Configure SD-WAN rules on the spoke FortiGates.

When configuring the root and downstream FortiGates, the Fabric Overlay Orchestrator configures the following settings in the background:

- IPsec overlay configuration (hub and spoke ADVPN tunnels)
- BGP configuration
- Policy routing
- SD-WAN zones
- SD-WAN performance SLAs

The FortiGate's role in the SD-WAN overlay is automatically determined by its role in the Security Fabric. The Fabric root will be the hub, and any first-level downstream devices from the Fabric root will be spokes.

After using the Fabric Overlay Orchestrator on all FortiGates and verifying the overlay settings, complete the SD-WAN deployment configuration using steps 3 (if applicable), and steps 6 and 7. See [SD-WAN rules on page 766](#) for more information.

Creating firewall policies

The Fabric Overlay Orchestrator can create firewall policies to allow all traffic through the SD-WAN overlay, or firewall policies to just allow health check traffic through it instead. When the Fabric Overlay Orchestrator is enabled on the root FortiGate, there are three *Policy creation* options:

- *Automatic*: automatically create policies for the loopback interface and tunnel overlays.
- *Health check*: automatically create a policy for the loopback interface so the SD-WAN health checks are functional.
- *Manual*: no policies are automatically created.

The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

When the Fabric Overlay Orchestrator is configured on a device, changing the policy creation rule will create new policies based on the rule, but it will not delete existing policies. Deleting existing policies must be performed manually.

Configuring the root FortiGate using the Fabric Overlay Orchestrator

To configure the root FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN > Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Hub* is selected. The Fabric root must always be the hub.
3. Set *Policy creation* to *Automatic*.

Fabric Overlay Orchestrator

1 Status 2 Overlay 3 Local Network 4 Summary

Status: ☒ Enabled ☐ Disabled

Role: ☒ Hub ☐ Spoke

Policy creation: ☒ Automatic
 Automatically creates policies for the loopback interface and tunnel overlays.

☐ Health check
 Automatically creates a policy for the loopback interface so SD-WAN health checks are functional.

☐ Manual
 No policies are created automatically.

Orchestration

The orchestrator will create a complete Hub-and-Spoke VPN between all participating FortiGates in the Security Fabric and add the tunnels to an SD-WAN zone. The following objects are created automatically:

- Firewall addresses
- BGP neighbors
- Firewall policies
- SD-WAN performance SLAs
- SD-WAN zone
- Hub-and-Spoke ADVPN tunnels

Topology

Note the following settings in this example:

SD-WAN zone	Located in the <i>Status</i> section: <i>fabric_vpn_sdwan</i> .
VPN tunnels	Located in the <i>Overlay</i> section in the <i>Incoming interface</i> table under the <i>Phase 1 Interface</i> column: <i>fabric_vpn1</i> and <i>fabric_vpn2</i> .
BGP	Located in the <i>Local Network</i> section. The <i>BGP AS</i> is 65400. The <i>Shared subnets</i> are 10.20.1.1/32 and 172.16.1.0/30.
Loopback interface	Located in the <i>Local Network</i> section: <i>F_Hub_loop</i> .
Firewall policies	Located in two sections: <ul style="list-style-type: none"> <i>Overlay</i> section in the <i>Incoming interface</i> table under the <i>Policy</i> column: <i>Fabric_overlay_0</i> and <i>Fabric_overlay_1</i> <i>Local Network</i> section in the <i>Shared subnets</i> table under the <i>Policies</i> column: <i>fabric_vpn_1_in</i>, <i>fabric_vpn_0_out</i>, and <i>fabric_vpn_0_in</i>

Configuring a downstream FortiGate using the Fabric Overlay Orchestrator

To configure a downstream FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN > Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Spoke* is selected. Only downstream first-level FortiGates can be spokes.

3. Click *Next*. The *Local Network* settings appear.
4. Configure the routing and local subnets to share with the VPN network in the following fields:

<i>Shared interfaces</i>	Select the interface of the local network to share with the VPN network.
--------------------------	--

Fabric Overlay Orchestrator

6. Review the settings, then click *Apply*.
An updated *Summary* page appears with all the settings.

Note the following settings in this example:

SD-WAN zone	Located in the <i>Status</i> section: <i>fabric_vpn_sdwan</i> .
VPN tunnels	Located in the <i>Overlay</i> section in the <i>Incoming interface</i> table under the <i>Phase 1 Interface</i> column: <i>fabric_vpn_1</i> .
BGP	Located in the <i>Local Network</i> section. The <i>BGP AS</i> is <i>65400</i> . The <i>Shared subnets</i> are <i>10.1.1.0/24</i> and <i>10.20.1.2/32</i> .
Loopback interface	Located in the <i>Local Network</i> section: <i>F_Hub_loop</i> .
Firewall policies	Located in the <i>Local Network</i> section in the <i>Shared subnets</i> table under the <i>Policies</i> column: <i>fabric_vpn_0_out</i> , <i>fabric_vpn_0_in</i> , and <i>fabric_vpn_1_in</i> .

The loopback IP addresses for the branches are generated based on the index number of the trusted device in the root FortiGate's Security Fabric (HUB) configuration.

```
config system csf
  set status enable
  set group-name "fabric"
  config trusted-list
    edit "FGVM02TM22000001"
```

```

        set serial "FGVM02TM22000001"
        set index 1
    next
    edit "FGVM02TM22000002"
        set serial "FGVM02TM22000002"
        set index 2
    next
end
end

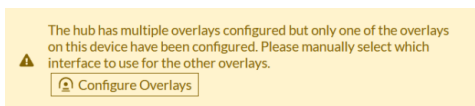

```

For example, if Branch1 (index 1) is the first FortiGate and Branch2 (index 2) is the second FortiGate authorized on the root FortiGate, the loopback addresses are generated as follows:

- Branch1 loopback IP: 10.20.1.2
- Branch2 loopback IP: 10.20.1.3

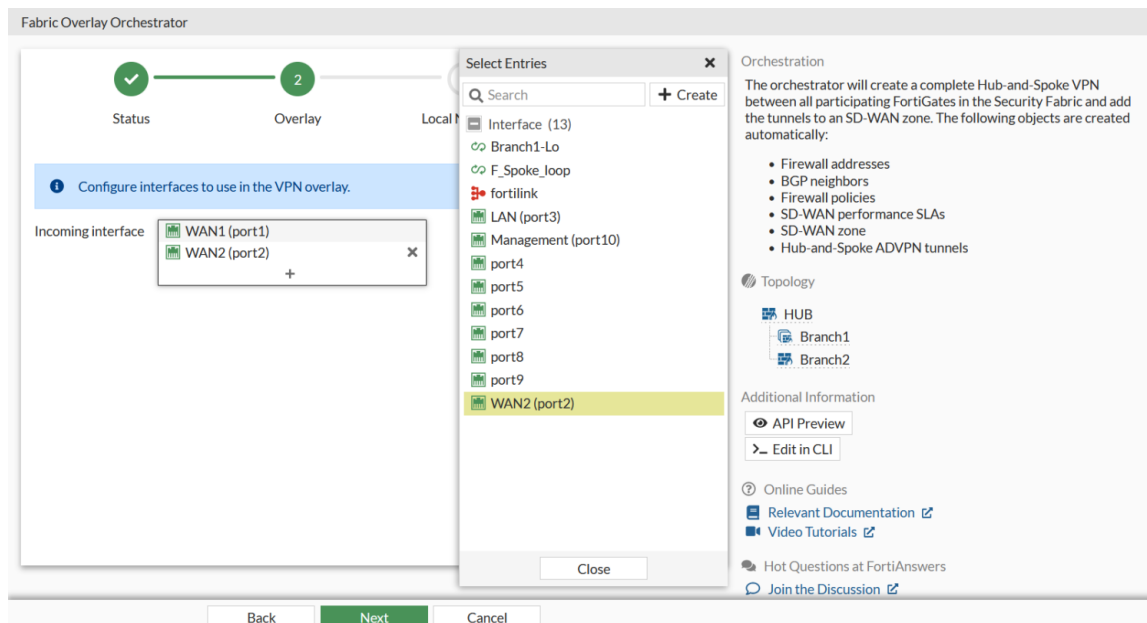

Configuring an overlay on the spoke for an additional incoming interface on the hub

A hub typically includes two incoming interfaces, but additional interfaces can be configured if needed. On downstream devices, the following warning is displayed on the *Fabric Overlay Orchestrator* page that *The hub has multiple overlays configured but only one of the overlays on this device have been configured. Please manually select which interface to use for the other overlays.*

To configure an additional incoming interface on a spoke:

1. Go to **VPN > Fabric Overlay Orchestrator**.
2. Click **Configure Overlays** in the warning box.
3. Navigate to the **Overlay** section, click the + in the **Incoming interface** field, and select **WAN2 (port2)** to add it to the overlay.

4. Click *Next*, then complete the remaining steps in the GUI wizard. On the *Summary* page, the additional interface *WAN2 (port2)* appears in the *Incoming interfaces* table.

Verifying the firewall policies on the hub FortiGate

Different policies are created on the hub FortiGate based on the *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*).

Automatic

Go to *Policy & Objects > Firewall Policy* to verify that wildcard firewall policies have been configured on the hub FortiGate. This Fabric Overlay Orchestrator configuration example uses automatic policy creation, and the following firewall policies are configured:

+ Create New	Edit	Delete	Policy lookup	Search	Export	Interface Pair View	By Sequence
Name	Source	Destination	Schedule	Service	Action	NAT	Security Profiles
fabric_vpn_sdwan → F_Hub_loop 1							
fabric_vpn_1_in	all	fabric_vpn_10.20.1.1_255.255.255.255_1	always	ALL	ACCEPT	Disabled	SSL no-inspection
fabric_vpn_sdwan → fabric_vpn_sdwan 2							
Fabric_overlay_0	all	all	always	ALL	ACCEPT	Disabled	SSL no-inspection
Fabric_overlay_1	all	all	always	ALL	ACCEPT	Disabled	SSL no-inspection
fabric_vpn_sdwan → Internal (port3) 1							
fabric_vpn_0_in	all	fabric_vpn_172.16.1.0_255.255.255.25...	always	ALL	ACCEPT	Disabled	SSL no-inspection
Internal (port3) → fabric_vpn_sdwan 1							
fabric_vpn_0_out	fabric_vpn_172.16.1.0_255.255.255.25...	all	always	ALL	ACCEPT	Disabled	SSL no-inspection
Implicit 1							
Security Rating Issues							
Updated: 00:24:13							

The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

Health check

Go to *Policy & Objects > Firewall Policy* to verify that a single firewall policy allowing health check traffic to the hub's loopback has been configured on the hub FortiGate. For example:

Create New

Edit

Delete

Policy lookup

Search

Q

Export

Interface Pair View

By Sequence

Name	Source	Destination	Schedule	Service	Action	NAT	Security Profiles	Log	Bytes
fabric_vpn_sdwan → F_Hub_loop 1									
fabric_vpn_0_in	all	fabric_vpn_10.20.1.1_255.255.255.255_1	always	ALL	ACCEPT	Disabled	SSL no-inspection	All	0 B
fabric_vpn_sdwan → fabric_vpn_sdwan 2									
Implicit 1									

Security Rating Issues

Updated: 13:48:07

Manual

Go to *Policy & Objects > Firewall Policy* to verify that no firewall policies have been created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the hub FortiGate to allow traffic to the loopback interface for health checks and the overlays.

Verifying the Fabric Overlay created by the Fabric Overlay Orchestrator

To verify the IPsec VPN tunnels on the hub:

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand it.
2. Verify that there are two tunnels established for each phase 1 interface.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
fabric_vpn_1_0	10.198.1.2	fabric_member_1	103.90 kB	104.76 kB	fabric_vpn_1_0	fabric_vpn_1
fabric_vpn_1_1	10.198.3.2	fabric_member_2	53.22 kB	53.42 kB	fabric_vpn_1_1	fabric_vpn_1
fabric_vpn_2_0	10.198.2.2	fabric_member_1	82.80 kB	81.68 kB	fabric_vpn_2_0	fabric_vpn_2
fabric_vpn_2_1	10.198.4.2	fabric_member_2	21.73 kB	21.93 kB	fabric_vpn_2_1	fabric_vpn_2

The naming convention < tunnel_name >_< number > indicates the relative order in which the tunnels were established:

<i>fabric_vpn_1_0</i>	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 1 using its WAN1 interface
<i>fabric_vpn_1_1</i>	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 2 using its WAN1 interface
<i>fabric_vpn_2_0</i>	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 1 using its WAN2 interface
<i>fabric_vpn_2_1</i>	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 2 using its WAN2 interface

Verify the BGP routing on the hub:

1. In the CLI, check the BGP peering status:

```
HUB # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.1, local AS number 65400
BGP table version is 11
1 BGP AS-PATH entries
0 BGP community entries
Next peer check timer due in 43 seconds

Neighbor    V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
10.10.10.1  4      65400    23     27      11    0    0 00:09:28      2
10.10.10.2  4      65400    16     16      11    0    0 00:06:36      2
10.10.11.1  4      65400    14     20      11    0    0 00:09:22      2
10.10.11.2  4      65400     7     11      11    0    0 00:03:22      2

Total number of neighbors 4
```

2. Check the BGP advertised routes:

```
HUB # get router info bgp neighbors 10.10.10.1 advertised-routes
VRF 0 BGP table version is 11, local router ID is 10.20.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop           Metric      LocPrf  Weight  RouteTag  Path
*>i10.1.1.0/24    10.10.11.1         100         0        0      0 i <- /2>
```

```

*>i10.1.2.0/24      10.10.11.2      100      0      0 i <-/2>
*>i10.1.2.0/24      10.10.10.2      100      0      0 i <-/1>
*>i10.10.10.0/24     10.10.10.253    100 32768    0 i <-/1>
*>i10.10.11.0/24     10.10.10.253    100 32768    0 i <-/1>
*>i10.20.1.1/32      10.10.10.253    100 32768    0 i <-/1>
*>i10.20.1.2/32      10.10.11.1      100      0      0 i <-/2>
*>i10.20.1.3/32      10.10.11.2      100      0      0 i <-/2>
*>i10.20.1.3/32      10.10.10.2      100      0      0 i <-/1>
*>i172.16.1.0/30     10.10.10.253    100 32768    0 i <-/1>

```

Total number of prefixes 10

3. In the GUI, go to *Dashboard > Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.

Neighbor IP	Local IP	Remote AS	State	Admin Status
10.10.10.1	10.10.10.253	65400	Established	Enabled
10.10.10.2	10.10.10.253	65400	Established	Enabled
10.10.11.1	10.10.11.253	65400	Established	Enabled
10.10.11.2	10.10.11.253	65400	Established	Enabled

To verify the performance SLAs on the hub:

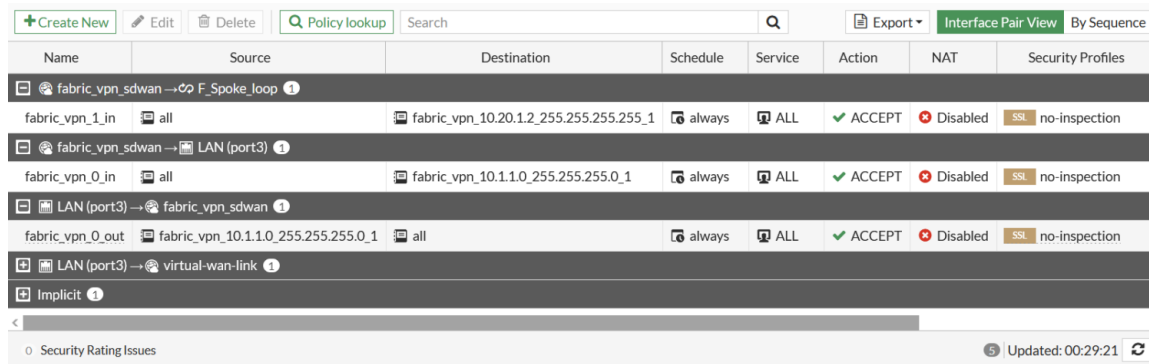

1. Go to *Network > SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLAs are automatically created for each spoke. The performance SLA naming uses the serial number of the spoke FortiGate. There are two new entries.

To verify the firewall policies on a spoke FortiGate:

Different policies are created on the spoke FortiGates based on the hub's *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*). The *Automatic* setting is used in this example.

1. Go to *Policy & Objects > Firewall Policy*.
2. Verify that wildcard firewall policies have been configured.

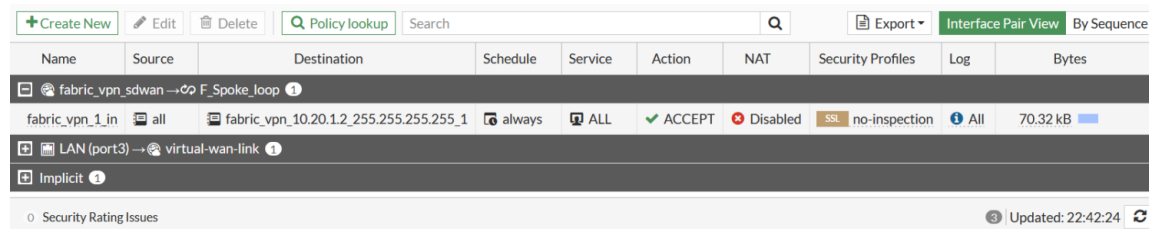

Name	Source	Destination	Schedule	Service	Action	NAT	Security Profiles
fabric_vpn_sdwan → F_Spoke_loop							
fabric_vpn_1_in	all	fabric_vpn_10.20.1.2_255.255.255.255_1	always	ALL	ACCEPT	Disabled	SSL no-inspection
fabric_vpn_sdwan → LAN (port3)							
fabric_vpn_0_in	all	fabric_vpn_10.1.1.0_255.255.255.0_1	always	ALL	ACCEPT	Disabled	SSL no-inspection
LAN (port3) → fabric_vpn_sdwan							
fabric_vpn_0_out	fabric_vpn_10.1.1.0_255.255.255.0_1	all	always	ALL	ACCEPT	Disabled	SSL no-inspection
LAN (port3) → virtual-wan-link							
Implicit							

The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

If the hub's *Policy creation* setting is *Health Check*, a single firewall policy that allows health check traffic to the spoke's loopback should be configured on the spoke FortiGates:

Name	Source	Destination	Schedule	Service	Action	NAT	Security Profiles	Log	Bytes
fabric_vpn_sdwan → F_Spoke_loop									
fabric_vpn_1_in	all	fabric_vpn_10.20.1.2_255.255.255.255_1	always	ALL	ACCEPT	Disabled	SSL no-inspection	All	70.32 kB
LAN (port3) → virtual-wan-link									
Implicit									

If the hub's *Policy creation* setting is *Manual*, there should be no new policies created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the spoke FortiGates to allow traffic to the loopback interface for health checks and the overlays.

To verify the IPsec VPN tunnels on a spoke:

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand it.
2. Verify the IPsec tunnels that go back to the hub.

+ Add Widget

IPv4 2				
10.10.10.253	10.10.10.1	65400	Established	Enabled
10.10.11.253	10.10.11.1	65400	Established	Enabled

Updated: 00:52:01

To verify the performance SLAs on a spoke:

1. Go to *Network > SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLA is automatically created for the hub FortiGate. There is a new entry (*FABRIC_VPN_HUB*).

To verify the spoke-to-spoke ADVPN communication:

1. From Branch1, ping Branch2 (10.20.1.3):

```
Branch1 # exec ping-options source 10.20.1.2
Branch1 # exec ping 10.20.1.3
PING 10.20.1.3 (10.20.1.3): 56 data bytes
64 bytes from 10.20.1.3: icmp_seq=0 ttl=254 time=27.7 ms
64 bytes from 10.20.1.3: icmp_seq=2 ttl=255 time=17.4 ms
64 bytes from 10.20.1.3: icmp_seq=3 ttl=255 time=17.5 ms
64 bytes from 10.20.1.3: icmp_seq=4 ttl=255 time=17.4 ms

--- 10.20.1.3 ping statistics ---
5 packets transmitted, 4 packets received, 20% packet loss
round-trip min/avg/max = 17.4/20.0/27.7 ms
```

2. Verify the IPsec tunnel summary.

- In the CLI, enter the following:

```
Branch1 # get vpn ipsec tunnel summary
'fabric_vpn_1_0' 10.198.3.2:0 selectors(total,up): 1/1 rx(pkt,err): 25/0 tx
(pkt,err): 26/2
'fabric_vpn_1' 10.198.5.2:0 selectors(total,up): 1/1 rx(pkt,err): 8032/0 tx
(pkt,err): 8022/2
'fabric_vpn_2' 10.198.6.2:0 selectors(total,up): 1/1 rx(pkt,err): 7462/0 tx
(pkt,err): 7478/1
```

The fabric_vpn_1_0 tunnel was created for spoke 1-to-spoke 2 communication.

- In the GUI, go to *Dashboard > Network* and click the *IPsec* widget to expand it.

+ Add Widget

Updated: 01:00:14

- Verify that the performance SLA was updated. Go to *Network > SD-WAN* and select the *Performance SLAs* tab.

The first performance SLA, *fabric_vpn_1*, that corresponds to the spoke-to-hub VPN tunnel is shown as up. The second one, *fabric_vpn_1* that corresponds to the spoke-to-spoke VPN tunnel (*fabric_vpn_1_0*) is shown as down since 10.20.1.1 is the IP address corresponding to the hub's loopback interface that is not present on another spoke.

Configuring SD-WAN rules on the hub FortiGate

On the hub, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to each spoke FortiGate using the serial number as the name of the performance SLA. SD-WAN rules must be configured on the hub FortiGate to direct traffic to each of the spokes using these performance SLAs.

To configure SD-WAN rules on the hub FortiGate:

- Go to *Network > SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
- Enter a name (such as *Hub-To-Br1*).
- In the *Source* section, set the *Address* to the local subnet of the hub.
- Configure the following in the *Destination* section:

- a. Set the *Address* to the local subnet of the spoke. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
 - b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
 - a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
 - b. Set the *Interface preference* to the SD-WAN members.
 - c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator for this the spoke. The name is based on the spoke FortiGate's serial number (*FGVM0XXX00000000 #1*).
6. Click *OK*.
7. Repeat these steps for the other spoke. Ensure the *Name* is unique, and that the *Destination* address corresponds to the local subnet behind the spoke.

If you need to disable the Fabric Overlay Orchestrator on the hub FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the hub FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Configuring SD-WAN rules on the spoke FortiGates

On each spoke, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to the hub FortiGate. An SD-WAN rule must be configured on the spoke FortiGates to direct traffic to the hub FortiGate using this performance SLA.

To configure an SD-WAN rule on a spoke FortiGate:

1. Go to *Network > SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *LAN-to-HUB*).
3. In the *Source* section, set the *Address* to the local subnet of the spoke.
4. Configure the following in the *Destination* section:
 - a. Set the *Address* to the local subnet of the hub. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
 - b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
 - a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
 - b. Set the *Interface preference* to the SD-WAN members.
 - c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator, which is named *FABRIC_VPN_HUB#1* by default.
6. Click *OK*.

If you need to disable the Fabric Overlay Orchestrator on a spoke FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the spoke FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Other VPN topics

The following topics provide instructions on configuring other VPN topics.

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip    XAUI Ports          Max    Cross-chip
              Speed offloading

1.
----

```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```

config vpn ipsec phase1/phase1-interface
    edit "vpn_name"
        set npu-offload enable/disable
    next
end

```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```

        sha512        : 0          1.

```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```

config system global
    set ipsec-asic-offload disable
    set ipsec-hmac-offload disable
end

```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some low end models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- [IKEv1 phase 1 encryption algorithm](#)
- [IKEv1 phase 2 encryption algorithm](#)
- [IKEv2 phase 1 encryption algorithm](#)
- [IKEv2 phase 2 encryption algorithm](#)
- [HMAC settings](#)

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

`aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1`

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- `des-md5`
- `des-sha1`
- `des-sha256`
- `des-sha384`
- `des-sha512`

3DES applies the DES algorithm three times to each data. FortiOS supports:

- `3des-md5`
- `3des-sha1`
- `3des-sha256`
- `3des-sha384`
- `3des-sha512`

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- `aes128-md5`
- `aes128-sha1`
- `aes128-sha256`
- `aes128-sha384`
- `aes128-sha512`
- `aes192-md5`
- `aes192-sha1`
- `aes192-sha256`
- `aes192-sha384`
- `aes192-sha512`
- `aes256-md5`
- `aes256-sha1`
- `aes256-sha256`
- `aes256-sha384`
- `aes256-sha512`

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See [Network processors \(NP6, NP6XLite, NP6Lite, and NP4\)](#) and [CP9, CP9XLite, and CP9Lite capabilities](#) in the Hardware Acceleration guide for more information.

IKEv1 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5

- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512

- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

IKEv2 phase 1 encryption algorithm

The default encryption algorithm is:

aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-prfsha256

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384

- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the chacha20poly1305 encryption algorithm, FortiOS supports:

- chacha20poly1305-prfsha1
- chacha20poly1305-prfsha256
- chacha20poly1305-prfsha384
- chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1

- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See [Network processors \(NP6, NP6XLite, NP6Lite, and NP4\)](#) and [CP9, CP9XLite, and CP9Lite capabilities](#) in the Hardware Acceleration guide for more information.

IKEv2 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512

- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU. CP9 supports AESGCM offloading. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256

- seed-sha384
- seed-sha512

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

DPD sent/recv: 000001e1/00000000
```

Fragmenting IP packets before IPsec encapsulation

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

The following options are available for the `ip-fragmentation` variable.

Option	Description
pre-encapsulation	Fragment before IPsec encapsulation.
post-encapsulation (default value)	Fragment after IPsec encapsulation (RFC compliant).

To configure packet fragmentation using the CLI:

```
config vpn ipsec phase1-interface
  edit "demo"
    set interface "port1"
    set authmethod signature
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

```

set ip-fragmentation pre-encapsulation
set remote-gw 172.16.200.4
set certificate "Fortinet_Factory"
next
end

```

Configure DSCP for IPsec tunnels

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the Encapsulating Security Payload (ESP) packet.

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the inner IP packet DSCP.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

Offloading traffic to the NPU must be disabled for the tunnel.

In this example, NPU offloading is disabled, `diffserv` is enabled, and the `diffserv` code is set to 000111 on FGT-A. Only one side of the tunnel needs to have `diffserv` enabled.

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

```

config vpn ipsec phase1-interface
edit "s2s"
    set interface "wan1"
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set npu-offload disable
    set dhgrp 14 5
    set wizard-type static-fortigate
    set remote-gw 173.1.1.1
    set psksecret *****
next
end

```

2. Configure the phase2-interface:

```

config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set dhgrp 14 5
        set diffserv enable
        set diffservcode 000111
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end

```

3. Check the state of the IPsec tunnel:

```

FGT-A # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1 dst_mtu=1500

Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPsec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.

Example

To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "ipv4"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp-ra-giaddr 11.11.11.1
        set psksecret *****
        set dpd-retryinterval 60
    next
end
```

IPv6 could also be configured:

```
config vpn ipsec phase1-interface
    edit "ipv6"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp6-ra-linkaddr 2000:11:11:11::1
        set psksecret *****
        set dpd-retryinterval 60
    next
end
```

2. Enable DHCP proxy and configure the DHCP server IP address:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip "10.1.1.1"
end
```

3. Repeat the above steps for FGT_C and subnet B.

FQDN support for remote gateways

FortiGate supports FQDN when defining an IPsec remote gateway with a dynamically assigned IPv6 address. When FortiGate attempts to connect to the IPv6 device, FQDN will resolve the IPv6 address even when the address changes.

Using FQDN to configure the remote gateway is useful when the remote end has a dynamic IPv6 address assigned by their ISP or DHCPv6 server.

To set the VPN to DDNS and configure FQDN:

```

config vpn ipsec phase1-interface
    edit "ddns6"
        set type ddns
        set interface "aggl"
        set ip-version 6
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set remotegw-ddns "rgwa61.vpnlab.org"
        set psksecret *****
    next
end

config vpn ipsec phase2-interface
    edit "ddns6"
        set phaselname "ddns6"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
        set src-subnet6 2003:1:1:1::/64
    next
end

```

FQDN resolves the IPv6 address

```

# diagnose test application dnsproxy 7

vfid=0, name=rgwa61.vpnlab.org, ttl=3600:3547:1747
    2003:33:1:1::22 (ttl=3600)

```

FortiGate uses FQDN to connect to the IPv6 device

```

# diagnose vpn tunnel list name ddns6
list ipsec tunnel by names in vd 0
-----
name=ddns6 ver=2 serial=2 2003:33:1:1::1:0->2003:33:1:1::22:0 dst_mtu=1500

Windows IKEv2 native VPN with user certificate

In this example, IKEv2 with Extensible Authentication Protocol – Transport Layer Security (EAP-TLS) using mutual certificate authentication is configured. Mutual certificate authentication means that both the client and server use certificates to identify themselves. EAP uses RADIUS, which is handled by the Network Policy Server (NPS) on the Windows server. Certificates are generated and distributed through Active Directory Certificate Services (AD CS). An additional certificate is used to identify the IPsec gateway.

This example assumes that the following Windows server roles are installed and available:

- NPS (RADIUS)
- AD CS with a generated CA
- Group Policy Management
- DNS server

It is also assumed that a connection is established between the NPS and FortiGate, and a DNS entry exists for the NPS that the FortiGate can resolve.

Certificates

The following certificates are required:

- CA certificate for EAP-TLS to sign the client and server certificates.
The CA certificate must be able to sign other certificates. It is created after AD CSs CA role installation. It is named `lab-local-CA`, as `lab.local` is the domain that is used in this example. The CA certificate is automatically installed on the server that is hosting the AD CS role. In this example, that server is also hosting the NPS and DNS server.
The *Key Usage* specifies *Certificate Signing*.
- Client certificate for EAP-TLS used by the windows client.
The client certificate is stored in the personal user certificate store and is used to authenticate the user. The certificate has *Client Authentication* and a SAN of the user's FQDN, and is signed by the CA. The CA is stored in *Current User > Trusted Root Certification Authorities*.
- Server certificate for EAP-TLS used by the server providing RADIUS authentication.
The NPS certificate must be in the hosting server's certificate store so that the NPS can access it. It has *Server Authentication* and a SAN DNS name to match the server's IP address. The user must use the FQDN to connect to the VPN. If the IP address that the name resolves to is used, the certificate will not be considered valid.
- VPN certificate used to identify the FortiGate dialup gateway.
The VPN certificate and private key are installed to the FortiGate using a CSR generated by the FortiGate

Configure the Windows server

The Windows server includes AD-CS, a RADIUS server, and a DNS server.

After the AD CS role has been installed and configured, the CA is ready to sign certificates.

Users and groups are defined first. The groups are configured to automatically receive certificates and relay membership to the FortiGate for granular access control through group matching in policies.

RADIUS is used to authorize connecting users. The RADIUS server returns users' groups with the access-accept response, to indicate to the FortiGate what groups the users belong to.

To create security groups and users:

1. Open *Active Directory Users and Computers*.
2. Create two groups, *Group1* and *Group2*.
3. Create two users, *User1* and *User2*.
4. Add *User1* to *Group1* and *User2* to *Group2*.

To create a certificate template to enable automatic enrollment for the user groups:

1. Open *Certificate Authority*.
2. In the navigation pane, expand the new CA, right-click *Certificate Template* and click *Manage*.
3. Configure a new certificate template:
 - a. Right-click the *User* template and click *Duplicate Template*.
 - b. On the *General* tab, enter a *Template display name*, such as *User Auto Enroll*.
 - c. Enable *Publish certificate in Active Directory* and *Do not automatically reenroll....*

Properties of New Template

Subject Name	Server	Issuance Requirements
Superseded Templates	Extensions	Security
Compatibility	General	Request Handling
	Cryptography	Key Attestation

Template display name:
User Auto Enroll

Template name:
UserAutoEnroll

Validity period: 1 years
Renewal period: 6 weeks

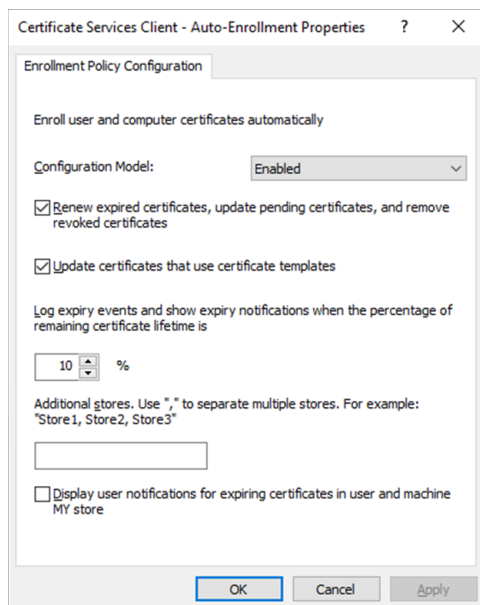

☒ Publish certificate in Active Directory
☒ Do not automatically reenroll if a duplicate certificate exists in Active Directory

OK Cancel Apply Help

- d. Configure the remaining settings as required, then go to the *Request Handling* tab.
 - e. Disable *Allow private key to be exported* and select *Enroll subject without requiring any user input*.
 - f. On the *Security* tab, in *Group or user name*, click *Add*.
 - g. Add *Group1* and *Group2*.
 - h. Select each group and, under *Permissions*, enable *Read*, *Enroll*, and *Autoenroll*.
 - i. On the *Extensions* tab, click *Application Policies* then click *Edit*.
 - j. Remove all of the policies except for *Client Authentication*.
 - k. Click OK then close the *Certificate Templates* console.
4. In the navigation pane, right-click *Certificate Template* and click *New > Certificate Template to Issue*.
 5. Select the new certificate template, *User Auto Enroll*, then click OK.

To create a group policy to enable automatic enrollment:

1. Open the *Group Policy Management* console.
2. In the navigation pane, go to *Forest:lab.local > Domains > lab.local*, and then click *Group Policy Objects*.
3. Click *Action*, and then click *New*.
4. Set a *Name* for the new GPO then click *OK*.
5. Right-click the new GPO and click *Edit*.
6. In the *Group Policy Management Editor* navigation pane, go to *User configuration > Windows Settings > Security Settings > Public Key Policies*.
7. In the content pane, double-click *Certificate Services Client - Auto-Enrollment*.
8. Set *Configuration Model* to *Enabled*.
9. Enable *Renew expired certificates...* and *Update certificates....*

10. Click *OK*.

To verify that users are receiving certificates:

1. Log into an endpoint with a domain user.
2. On the server, open Certification Authority.
3. Expand the CA and select *Issued Certificates*.
4. Verify that the user logged into the endpoint is listed under *Requested Name*. You can also check the local user certificate store on the endpoint.

To generate and sign a CSR and import the signed certificate to the FortiGate:

1. On the FortiGate and go to *System > Certificates* and click *Create/Import > Generate CSR*.
2. Configure the CSR:

Certificate Name	vpn.lab.local
-------------------------	---------------

ID Type	Domain Name
Domain Name	vpn.lab.local
Subject Alternative Name	DNS:vpn.lab.local

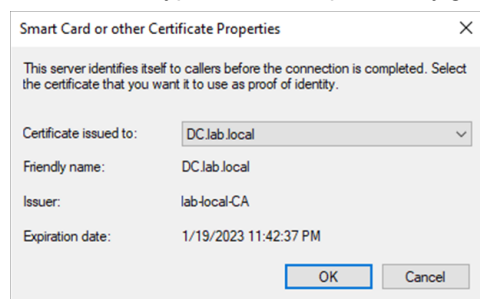

3. Configure the remaining settings as required, then click *OK*.
4. Download the CSR to a location that is accessible to the CA server, in this example: C:\CSR\
5. Sign the CSR with the previously created CA:
 - a. Open the command prompt as an administrator and enter the following:

```
certreq -submit -attrib "CertificateTemplate:WebServer" C:\CSR\vpn.lab.local.csr
```

The *Certification Authority List* window opens.
 - b. Select the CA and click *OK*.
 - c. Save the signed certificate with a .cer file extension to a location that is accessible from the FortiGate.
6. Import the signed certificate to the FortiGate:
 - a. On the FortiGate, go to *System > Certificates* and click *Create/Import > Certificate*.
 - b. Click *Import Certificate*.
 - c. Set *Type* to *Local Certificate*.
 - d. Click *Upload* and locate and select the signed certificate
 - e. Click *Create* then click *OK*.

To configure network policies on the RADIUS server:

1. Open the *Network Policy Server* and, in the console tree, expand *Policies*.
2. Right-click on *Network Policies* and click *New*.
3. Enter a *Policy name*, such as *VPN-Group1*, then click *Next*.
4. Under *Condition description* click *Add*:
 - a. Select *User Groups*, then click *Add*.
 - b. Click *Add Groups*.
 - c. Enter the group name, *Group1*, click *Check Names* to confirm the group.
 - d. Click *OK* in both windows.
5. Click *Next*.
6. Make sure that *Access granted* is selected, then click *Next*.
7. On the *Configure Authentication Methods* page, click *Add* and add the EAP type *Microsoft: Smart Card or other certificate*.
8. Edit the EAP type, select the previously generated certificate, then click *OK*.

9. Deselect all of the *Less secure authentication methods* then click *Next*.

10. Configure constraints as needed, then click *Next*.
11. On the *Configure Settings* page, under *RADIUS Attributes*, select *Vendor Specific*, then click *Add*:
 - a. In the *Attributes* list, select *Vendor-Specific*, then click *Add*.

- b. In the *Attribute Information* window, click *Add*.
- c. In the *Vendor-Specific Attribute Information* window, enter the *Vendor Code*, 12356, and select *Yes. It conforms*.
- d. Click *Configure Attribute* and configure the following:

Vendor-assigned attribute number	1
Attribute format	String
Attribute value	Group

- e. Click *OK* on all three windows and on the *Add Vendor Specific Attribute* window click *Close*.
12. Click *Next*.
13. On the *Completing New Network Policy* page, review the configuration, then click *Finish*.
14. Duplicate the policy for *Group2*, and call the new policy *VPN-Group2*.
15. Reorder the policies so that *VPN-Group1* and *VPN-Group2* are one and two in the processing order.

To add the FortiGate as a RADIUS client:

1. Open the *Network Policy Server* and, in the console tree, expand *RADIUS Clients and Servers*.
2. Right-click on *RADIUS Clients* and click *New*.
3. Add the FortiGate as a RADIUS client:

Friendly name	FGT1
Address	10.0.1.1
Shared Secret	Manually enter the shared secret.

- Click **OK**.

To create a DNS entry for the VPN connection:

- Open the *DNS Manager*.
- Go to *DC > Forward Lookup Zones* and select *lab.local*.
- Right click in the content pane and select *New Host (A or AAAA)*.
- Enter the VPN name. The FQDN should be auto-filled with *vpn.lab.local*.

- Enter an IP address.
- Click **Add Host**.

Configure the FortiGate

An IPsec VPN tunnel is configured to connect to the NPS (RADIUS) server for EAP authentication. For information about IPsec VPN, see [IPsec VPNs on page 1765](#).

A RADIUS server is added to relay VPN authentication requests to the NPS server. For information about RADIUS servers, see [RADIUS servers on page 2258](#).

Three groups are created that point to the RADIUS server for authentication: one group each for user group *Group1*, user group *Group2*, and the remote server. For information about groups, see [User groups on page 2231](#).

Three firewall policies are created to test the functionality of the three user groups (see [Policies on page 1176](#)):

- Policy 1 allows VPN clients to communicate with each other.
- Policy 2 allows VPN clients in the *Group1* user group to communicate with *Server1* and *Server3*.
- Policy 3 allows VPN clients in the *Group2* user group to communicate with *Server1* and *Server2*.

To configure IPsec VPN in the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Enter a name for the VPN, such as *VPN1*.
3. Set *Template type* to *Custom*, then click *Next*.
4. In the *Network* section, configure the following:

Remote Gateway	Dialup User
Interface	port1
Mode Config	Enable
Assign IP From	Range
Client Address Range	10.58.58.1-10.58.58.10
DNS Server	192.168.1.100
Enable IPv4 Split Tunnel	Enable
Accessible Networks	Select the networks that VPN users will have access to.

5. In the *Authentication* section, configure the following:

Method	Signature
Certificate Name	vpn.lab.local
Version	2
Accept Types	Any peer ID

6. In the *Phase 1 Proposal* section, configure the following:

Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1

Diffie-Hellman Groups	14, 5, 2
Local ID	vpn.lab.local

7. In the *Phase 2 Selectors* section, configure the following:

Local Address	Named Address - all
Remote Address	Named Address - all
Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1
Enable Perfect Forward Secrecy (PFS)	Disable
Autokey Keep Alive	Enable

8. Enable EAP settings in the CLI:

```
config vpn ipsec phase1-interface
    edit VPN1
        set eap enable
        set eap-identity send-request
    next
end
```

To configure IPsec VPN in the CLI:

```
config vpn ipsec phase1-interface
    edit "VPN1"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set mode-cfg enable
        set ipv4-dns-server1 192.168.1.100
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set localid "vpn.lab.local"
        set dpd on-idle
        set dhgrp 14 5 2
        set eap enable
        set eap-identity send-request
        set certificate "vpn.lab.local"
        set ipv4-start-ip 10.58.58.1
        set ipv4-end-ip 10.58.58.10
        set ipv4-split-include "10/8_net"
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "VPN1"
        set phase1name "VPN1"
```

```
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set pfs disable
        set keepalive enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "all"
        set dst-name "all"
    next
end
```

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter a name for the server, such as *NPS*.
3. Enter the *Primary Server IP/Name* and *Secret*.

The *Test User Credentials* option will not work, as it does not use certificates for the test.

4. Click *OK*.

To add the RADIUS server in the CLI:

```
config user radius
    edit "NPS"
        set server <ip>
        set secret *****
    next
end
```

To configure the user groups in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group, such as *Group1*.
3. In the *Remote Groups* table, click *Add*:
 - a. Set *Remote Server* to the just created RADIUS server, *NPS*.
 - b. Set *Groups* to *Specify* and enter *Group1*.
 - c. Click *OK*.
4. Click *OK*.
5. Create a second group called *Group2* with the same *Remote Server* and *Group Name* set to *Group2*.
6. Create a third group called *RADIUS* with the same *Remote Server* but no *Group Name*.

To configure the user groups in the CLI:

```
config user group
    edit "Group1"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group1"
            next
        end
    next
```

```
edit "Group2"
    set member "NPS"
    config match
        edit 1
            set server-name "NPS"
            set group-name "Group2"
        next
    end
next
edit "RADIUS"
    set member "NPS"
next
end
```

To configure the policies in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure policy 1:

Name	VPN-VPN
Incoming Interface	VPN1
Outgoing Interface	VPN1
Source	all, RADIUS
Destination	all
Schedule	always
Service	ALL
NAT	Disable

3. Click *OK*.
4. Click *Create New* again and configure policy 2:

Name	VPN Group1
Incoming Interface	VPN1
Outgoing Interface	Server1, Server3
Source	all, Group1
Destination	10.10.0.1, 10.10.0.3
Schedule	always
Service	ALL
NAT	Disable

5. Click *OK*.

6. Click *Create New* again and configure policy 3:

Name	VPN Group2
Incoming Interface	VPN1
Outgoing Interface	Server1, Server2
Source	all, Group2
Destination	10.10.0.1, 10.10.0.2
Schedule	always
Service	ALL
NAT	Disable

7. Click *OK*.

To configure the policies in the CLI:

```
config firewall policy
  edit 1
    set name "VPN-VPN"
    set srcintf "VPN1"
    set dstintf "VPN1"
    set action accept
    set srcaddr "all" "RADIUS"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set nat disable
  next
  edit 2
    set name "VPN Group1"
    set srcintf "VPN1"
    set dstintf "Server1" "Server3"
    set action accept
    set srcaddr "all" "Group1"
    set dstaddr "10.10.0.1" "10.10.0.3"
    set schedule "always"
    set service "ALL"
    set nat disable
  next
  edit 3
    set name "VPN Group2"
    set srcintf "VPN1"
    set dstintf "Server1" "Server2"
    set action accept
    set srcaddr "all" "Group2"
    set dstaddr "10.10.0.1" "10.10.0.2"
    set schedule "always"
    set service "ALL"
    set nat disable
  next
end
```

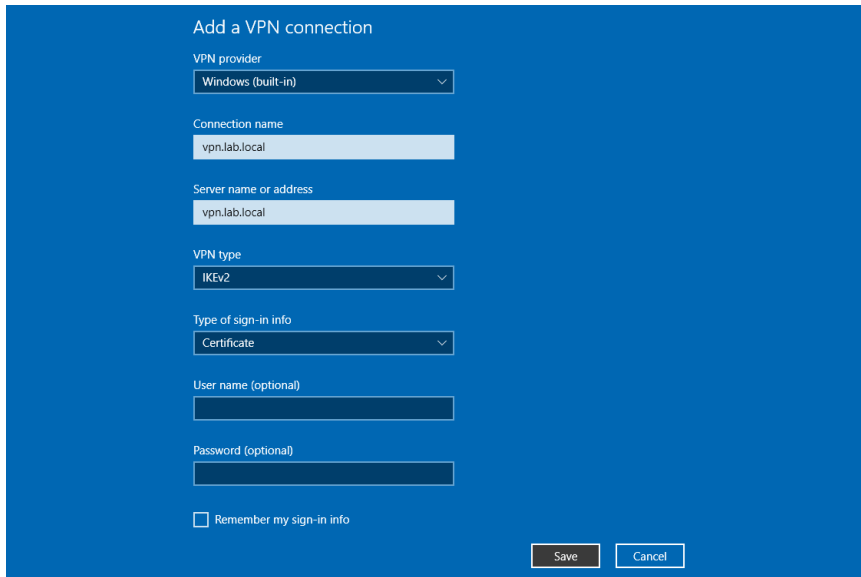

Configure the Windows client

The configuration is done on a Windows 10 Enterprise endpoint.

To add VPN connection and configure a VPN interface:

1. Open the *Settings* page and go to *Network & Internet > VPN*.
2. Click *Add a VPN connection*.
3. Configure the following:

VPN provider	Windows (built-in)
Connection name	vpn.lab.local
Server name or address	vpn.lab.local
VPN type	IKEv2
Type of sign-in info	Certificate

4. Click *Save*.
5. Go to *Network & Internet > Status* and, under *Advanced network settings*, click *Change adapter options*.
6. Select the VPN connection then click *Change settings of this connection*, or right-click on the connection and select *Properties*:
 - a. Go to the *Settings* tab and, in the *Authentication* section, click *Properties*.
 - b. Select *Use a certificate on this computer* and enable *Use simple certification selection*.
 - c. Enable *Verify the server's identity by validating the certificate*.
 - d. Optionally, enable *Connect to these servers* and enter your NPS server's FQDN, in this case *DC.lab.local*.
 - e. In the *Trusted Root Certificate Authorities* list, select the CA *lab-local-CA*.

f. Click OK, then click OK again.

To test the connection:

1. Log in to the Windows endpoint as user1.
2. Open the network settings and connect to the *vpn.lab.local* VPN.
3. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server3 (10.10.0.3), but not server2 (10.10.0.2).
4. Log out of the Windows endpoint, then log back in as user2.
5. Open the network settings and connect to the *vpn.lab.local* VPN.
6. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server2 (10.10.0.2), but not server3 (10.10.0.3).

IPsec IKE load balancing based on FortiSASE account information

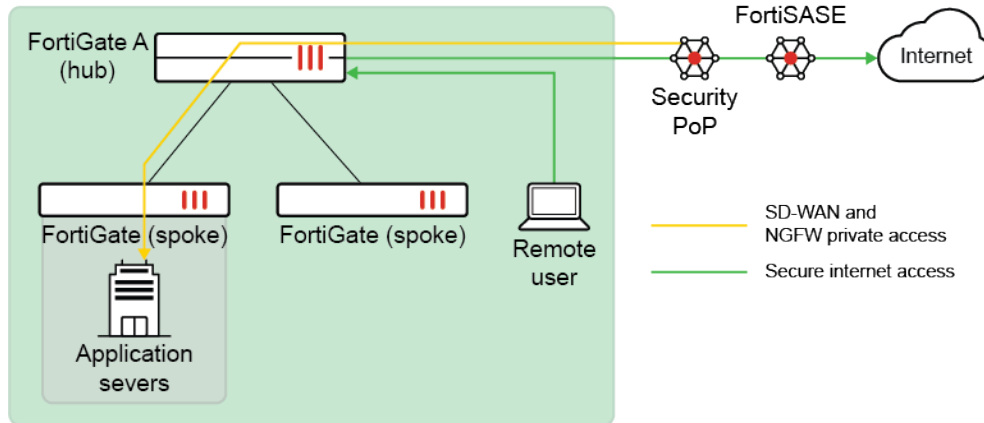

The FortiGate device ID is carried by the IKEv2 message NOTIFY payload when it is configured.

```
config vpn ipsec phase1-interface
  edit <name>
    set dev-id-notification enable
    set dev-id <string>
  next
end
```

This device ID configuration is required when the FortiGate is configured as a secure edge LAN extension for FortiSASE. It allows FortiSASE to distribute IKE/IPsec traffic according to the FortiGate device ID to achieve load balancing.

Example

In this example, a FortiGate SD-WAN is configured, which acts as a secure edge. FortiSASE ensures secure internet access for users in the local network behind the FortiGate and allows other FortiSASE remote users with secure private access to private resources behind the FortiGate.

To configure FortiGate A (FGT-A):

1. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
  edit "ul-port1"
    set interface "port1"
    set ike-version 2
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set localid "peerid-UNshTWcLQ22UNWqk0UwYtCQNtVhujrxAdyMG0qRsGVkx9mM8ksdaRZOF"
    set dpd on-idle
    set comments "[FGCONN] Do NOT edit. Automatically generated by extension controller."
    set dev-id-notification enable
    set dev-id "FGT_A"
    set remote-gw 172.16.200.2
    set psksecret *****
  next
end
```

2. Verify that the IPsec tunnel is established:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 3
-----
name=ul-port1 ver=2 serial=3 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 tun_
id6=:172.16.200.2 dst_mtu=1500 dpd-link=on weight=1
bound_if=19 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-rfc
run_state=0 role=primary accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=4 ilast=0 olast=0 ad=/0
stat: rxp=2689 txp=7115 rxb=278520 txb=617095

IPsec SA key retrieval from a KMS server using KMIP

In environments that require centralized management of cryptographic keys where no key derivations or algorithmic operations are allowed on edge devices (such as the FortiGate), they will deploy a Key Management Services (KMS)

server cluster to generate and manage all cryptographic keys. Then, the Key Management Interoperability Protocol (KMIP) is used on the edge devices to locate the KMS server, create keys if they do not exist, and retrieve keys to be used for securing these edge devices.

FortiGate's have a KMIP client that sends KMIP requests to locate the Key Management Services (KMS) server, creates keys if they do not exist on the KMS server, and retrieves keys from the KMS server to use as IPsec security association (SA) keys for IKEv2 only.

This feature allows the FortiGate to offload the task of generating IPsec SA keys to a KMS server, regardless of specific IPsec VPN topologies with a FortiGate, when the administrator has the requirement to centralize cryptographic keys management in a KMS server.

The FortiGate's integrated KMIP client also supports the following:

- If the KMS server is unavailable, then the FortiGate continues to use the previous keys to avoid a network blackout.
- ADVPN configurations for the hub and spoke, so that shortcuts between two spokes will use their own encryption keys retrieved from the KMS server.
- Multiple tunnels between the same tunnel endpoints using multiple VRFs.

To configure the KMIP server:

```
config vpn kmip-server
    edit <KMS_server_ID>
        config server-list
            edit <ID>
                set server <server_IP>
                set cert <string>
            next
        end
        set username <username_defined_on_KMS_server>
        set password <password>
    next
end
```

To apply the KMS server in the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit <name>
        set kms <KMS_server_ID>
    next
end
```

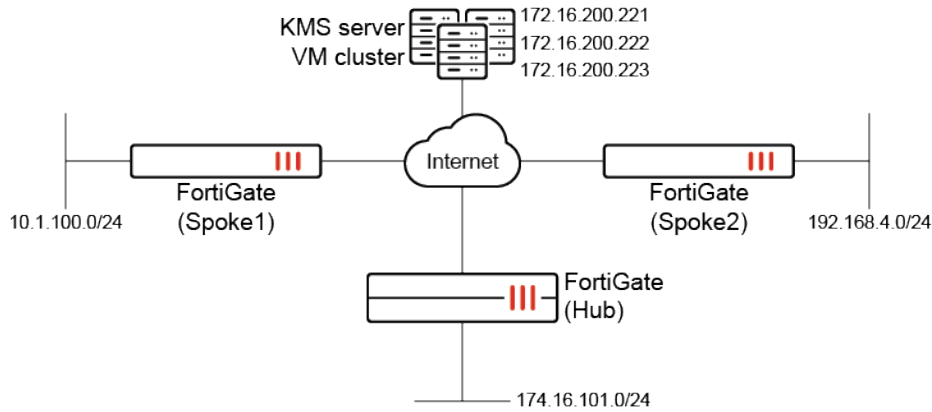

IPsec tunnels will not be established if a FortiGate VPN peer does not support KMS, or has not configured `kms <KMS_server_ID>` in `config vpn ipsec phase1-interface`.

The following diagnostic commands have been added:

- `get vpn ike kms-keys`
- `diagnose debug application kmipd -1`
- `execute kmip {create | destroy | get | locate | rekey} <parameter>`

Example

In this example, there is a topology with an ADVPN hub FortiGate and two spoke FortiGates. There is a cluster of three KMS server VMs (172.16.200.221, 172.16.200.222, and 172.16.200.223) that operates in round-robin mode. The `testuser1_Cert` certificate is issued by the KMS server, and the `testuser1` user is defined on the KMS server. Authentication to the KMS server by the KMIP client requires both a certificate and a password.

The Hub FortiGate acting as the responder will try to locate keys on the KMS server first. If they do not exist, the FortiGate requests to create new keys on KMS server. The responder sends the keys' names to the Spoke1 and Spoke2 FortiGates acting as the initiators using IKE messages, and these initiators locate and retrieve keys from KMS server using the keys' names. The `keylifeseconds` parameter in phase 2 defines how often the FortiGate will try to synchronize local keys to those on the KMS server.

The keys are retrieved from the KMS server and used as IPsec SA keys in IPsec tunnels. The key format used is: [IDi/r]-[IDr/i]-[phase2name]-ENC/AUTH-[keyalg]-[keylen].

First, this example focuses on the Hub FortiGate and the IPsec VPN connection between the Spoke1 and Hub FortiGate. Second, this example focuses on the spoke-to-spoke tunnel, also known as a shortcut tunnel or shortcut, which is established when traffic flows between the Spoke1 and Spoke2 FortiGates.

To configure IPsec SA key retrieval from a KMS server on the Hub FortiGate:

1. Configure the KMIP server:

```
config vpn kmip-server
  edit "KMS_server"
    config server-list
      edit 1
        set server "172.16.200.221"
        set cert "testuser1_Cert"
      next
      edit 2
        set server "172.16.200.222"
        set cert "testuser1_Cert"
      next
      edit 3
        set server "172.16.200.223"
        set cert "testuser1_Cert"
      next
    end
  set username "testuser1"
```

```

        set password *****
    next
end

```

2. Configure the IPsec VPN phase 1 settings:

```

config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set kms "KMS_server"
        set certificate "Fortinet_Factory_Backup"
        set dpd-retryinterval 60
    next
end

```

This feature is only supported in IKEv2. The `localid` is required in the phase 1 settings when using the PSK authentication method.

3. Configure the IPsec VPN phase 2 settings:

```

config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set keylifeseconds 7200
    next
end

```

To verify the IPsec configuration and tunnel between the Hub and Spoke1 FortiGates:

1. Verify the tunnel state on the Hub:

```

Hub # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=hub ver=2 serial=1 172.16.200.4:0->0.0.0.0:0 tun_id=10.0.0.1 tun_id6=::10.0.0.1

```

3. Verify the FortiGate (KMIP client) connection to the KMS server:

```

Spokel # execute kmip locate KMS_server hub-Spokel-hub-AUTH-SHA1-20
Locating key 'hub-Spokel-hub-AUTH-SHA1-20', jobid=1935521133
Ret=0, jobid=1935521133
Key ID: 2ba130bfff7174ba7a237d7ea53611121383b132cf18a4fd183890ca196296cb4

```

4. Verify the IKE and KMIP debug messages on Spoke1 to confirm that when the KMS server is down during IPsec rekey, IPsec tunnel does not go down:

```

Spokel # diagnose debug application ike -1
Spokel # diagnose debug application kmipd -1

ike 0:spokel1:543:580 rekey in progress for SPI 471dfe32

IPsec related diagnose commands

This section provides IPsec related diagnose commands.

- **Daemon IKE summary information list:** `diagnose vpn ike status`

```

connection: 2/50
IKE SA: created 2/51 established 2/9 times 0/13/40 ms
IPsec SA: created 1/13 established 1/7 times 0/8/30 ms

```

- **IPsec phase1 interface status:** `diagnose vpn ike gateway list`

```

vd: root/0
name: tofgtc
version: 1
interface: port13 42
addr: 173.1.1.1:500 -> 172.16.200.3:500
created: 4313s ago
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 0/0

```

```

id/spi: 92 5639f7f8a5dc54c0/809a6c9bbd266a4b
direction: initiator
status: established 4313-4313s ago = 10ms
proposal: aes128-sha256
key: 74aa3d63d88e10ea-8a1c73b296b06578
lifetime/rekey: 86400/81786
DPD sent/rcv: 00000000/00000000

```

```

vd: root/0
name: to_HQ
version: 1
interface: port13 42
addr: 173.1.1.1:500 -> 11.101.1.1:500
created: 1013s ago

```

```
assigned IPv4 address: 11.11.11.1/255.255.255.252
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms
```

```
id/spi: 95 255791bd30c749f4/c2505db65210258b

- [Restricting VPN access to rogue/non-compliant devices with Security Fabric](#)

SSL VPN best practices

Securing remote access to network resources is a critical part of security operations. SSL VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers. When not in use, SSL VPN can be disabled.

Choosing the correct mode of operation and applying the proper levels of security are integral to providing optimal performance and user experience, and keeping your user data safe.

The below guidelines outline selecting the correct SSL VPN mode for your deployment and employing best practices to ensure that your data are protected.

Information about SSL VPN throughput and maximum concurrent users is available on your device's datasheet; see [Next-Generation Firewalls Models and Specifications](#).

Tunnel mode

In tunnel mode, the SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate.

The FortiGate establishes a tunnel with the client, and assigns a virtual IP (VIP) address to the client from a range reserved addresses. While the underlying protocols are different, the outcome is very similar to a IPsec VPN tunnel. All client traffic is encrypted, allowing the users and networks to exchange a wide range of traffic, regardless of the application or protocols.

Use this mode if you require:

- A wide range of applications and protocols to be accessed by the remote client.
- No proxying is done by the FortiGate.

- Straightforward configuration and administration, as traffic is controlled by firewall policies.
- A transparent experience for the end user. For example, a user that needs to RDP to their server only requires a tunnel connection; they can then use the usual client application, like Windows Remote Desktop, to connect.

Full tunneling forces all traffic to pass through the FortiGate (see [SSL VPN full tunnel for remote user on page 2054](#)). Split tunneling only routes traffic to the designated network through the FortiGate (see [SSL VPN split tunnel for remote user on page 2047](#)).

Limitations

Tunnel mode requires that the [FortiClient VPN](#) client be installed on the remote end. The standalone FortiClient VPN client is free to use, and can accommodate SSL VPN and IPsec VPN tunnels. For supported operating systems, see the [FortiClient Technical Specifications](#).

Web mode

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Users authenticate to FortiGate's SSL VPN Web Portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies this communication with the server. All communication between the FortiGate and the user continues to be over HTTPS, regardless of the service that is being accessed.

The clipboard can be disabled for SSL VPN web mode RDP/VNC connections, see [Disable the clipboard in SSL VPN web mode RDP connections on page 2206](#).

Use this mode if you require:

- A clientless solution in which all remote services are access through a web portal.
- Tight control over the contents of the web portal.
- Limited services provided to the remote users.

Limitations

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as certain shortcut keys not being supported.
- In some configurations RDP can consume a significant amount of memory and CPU time.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might not render correctly.

Security best practices

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator.

By integrating with existing authentication servers, such as Windows AD, there is a lower change of making mistakes when configuring local users and user groups. Your administration effort is also reduces.

See [SSL VPN with LDAP user authentication on page 2084](#) for more information.

Use a non-factory SSL certificate for the SSL VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See [Procuring and importing a signed SSL certificate on page 2721](#) for more information.

Enabling the *Do not Warn Invalid Server Certificate* option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. [FortiToken Mobile](#) is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the [FortiToken Mobile iOS app](#) or through Fortinet partners.

See [SSL VPN with FortiToken mobile push authentication on page 2111](#) for more information.

2FA, a subset of MFA, can also be set up with email tokens. See [Email Two-Factor Authentication on FortiGate](#) for information.

Deploy user certificates for remote SSL VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See [SSL VPN with certificate authentication on page 2093](#) for more information.

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See [How to control the SSL version and cipher suite for SSL VPN](#) for more information.

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See [SSL VPN multi-realm on page 2156](#) for more information.

Disable SSL VPN

After the SSL VPN settings have been configured, SSL VPN can be disabled when not in use.

To disable SSL VPN in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Disable *Enable SSL-VPN*.
3. Click *Apply*.

To disable SSL VPN in the CLI:

```
config vpn ssl settings
    set status disable
end
```

SSL VPN quick start

The following topics provide introductory instructions on configuring SSL VPN:

- [SSL VPN split tunnel for remote user on page 2047](#)
- [Connecting from FortiClient VPN client on page 2050](#)
- [Set up FortiToken multi-factor authentication on page 2052](#)
- [Connecting from FortiClient with FortiToken on page 2053](#)

SSL VPN split tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient but accessing the Internet without going through the SSL VPN tunnel.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internal subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
 - b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See [Split tunneling settings on page 2063](#) for more information.
 - c. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

- d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
 - e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn split tunnel access*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Choose an *Outgoing Interface*. In this example, *port1*.
 - e. Set the *Source* to *all* and group to *sslvpngroup*.
 - f. In this example, the *Destination* is *all*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
```

```
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
```

```

        next
    next
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```

config firewall policy
    edit 1
        set name "sslvpn split tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

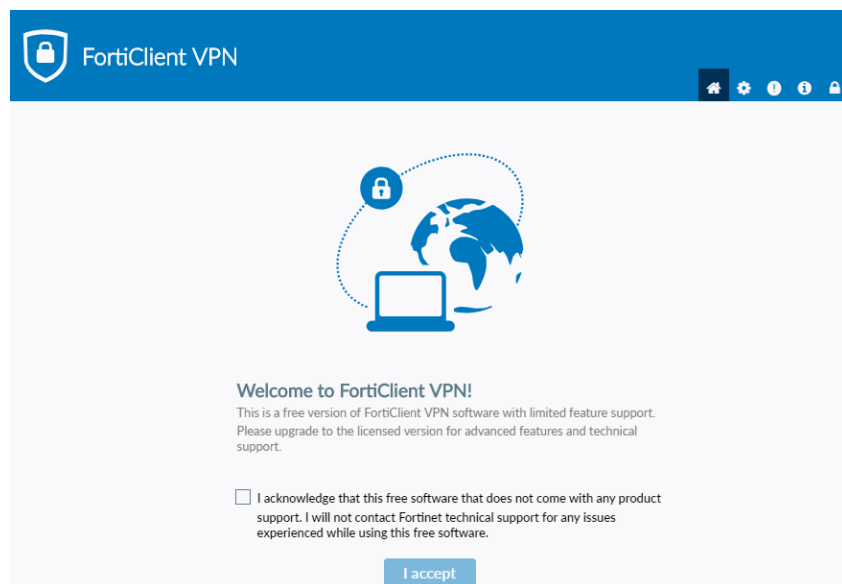

Connecting from FortiClient VPN client

For FortiGate administrators, a free version of FortiClient VPN is available which supports basic IPsec and SSL VPN and does not require registration with EMS. This version does not include central management, technical support, or some advanced features.

Downloading and installing the standalone FortiClient VPN client

You can download the free VPN client from [FNDN](#) or [FortiClient.com](#).

When the free VPN client is run for the first time, it displays a disclaimer. You cannot configure or create a VPN connection until you accept the disclaimer and click *I accept*:

Configuring an SSL VPN connection

To configure an SSL VPN connection:

1. On the *Remote Access* tab, click on the settings icon and then *Add a New Connection*.

2. Select *SSL-VPN*, then configure the following settings:

Connection Name	SSLVPNtoHQ
Description	(Optional)
Remote Gateway	172.20.120.123
Customize port	10443
Client Certificate	Select <i>Prompt on connect</i> or the certificate from the dropdown list.
Authentication	Select <i>Prompt on login</i> for a prompt on the connection screen

3. Click *Save* to save the VPN connection.

Connecting to SSL VPN

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
5. Click the *Disconnect* button when you are ready to terminate the VPN session.

Checking the SSL VPN connection

To check the SSL VPN connection using the GUI:

1. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. On the FortiGate, go to *Log & Report > Forward Traffic* to view the details of the SSL entry.

To check the tunnel log in using the CLI:

```
get vpn ssl monitor
```

SSL VPN Login Users:

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1 (1)	291	10.1.100.254	0/0	0/0

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

Set up FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the split tunnel configuration ([SSL VPN split tunnel for remote user on page 2047](#)). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Configure a user and user group:
 - a. Go to *User & Authentication > User Definition* and edit local user *sslvpnuser1*.
 - b. Enable *Two-factor Authentication*.
 - c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
 - d. Enter the user's *Email Address*.
 - e. Enable *Send Activation Code* and select *Email*.
 - f. Click *Next* and click *Submit*.
2. Activate the mobile token.
When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Configure a user and user group:

```
config user local
  edit "sslvpnuser1"
    set type password
    set two-factor fortitoken
    set fortitoken <select mobile token for the option list>
    set email-to <user's email address>
    set passwd <user's password>
  next
end
config user group
  edit "sslvpngroup"
```

```

        set member "sslvpnuser1"
    next
end

```

2. Activate the mobile token.

When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Connecting from FortiClient with FortiToken

To activate your FortiToken:

1. On your device, open FortiToken Mobile. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

2. You should have received your notification via email, select + and use the device camera to scan the token QR code in your email.

3. FortiToken Mobile provisions and activates your token and generates token codes immediately. To view the OTP's digits, select the eye icon. After you open the application, FortiToken Mobile generates a new six-digit OTP every 30 seconds.

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list. Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. A Token field will appear, prompting you for the FortiToken code. Enter the FortiToken code from your Mobile device.
5. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
6. Click the *Disconnect* button when you are ready to terminate the VPN session.

SSL VPN tunnel mode

The following topics provide instructions on configuring SSL VPN tunnel mode:

- [SSL VPN full tunnel for remote user](#)
- [SSL VPN tunnel mode host check](#)
- [SSL VPN split DNS on page 2060](#)
- [Split tunneling settings on page 2063](#)

SSL VPN full tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address:
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
2. Configure user and user group:
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-full-tunnel-portal*.
 - b. Disable *Split Tunneling*.
4. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
 - e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-full-tunnel-portal*.

5. Configure SSL VPN firewall policies to allow remote user to access the internal network:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set *Name* to *sslvpn tunnel mode access*.
 - c. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set *Outgoing Interface* to *port1*.
 - e. Set the *Source Address* to *all* and *User* to *sslvpngroup*.
 - f. Set *Destination* to *all*, *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - g. Click *OK*.
 - h. Click *Create New*.
 - i. Set *Name* to *sslvpn tunnel mode outgoing*.
 - j. Configure the same settings as the previous policy, except set *Outgoing Interface* to *wan1*.
 - k. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end
```

3. Configure user and user group.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd your-password
  next
end

config user group
  edit "sslvpngroup"
    set member "sslvpnuser1"
  next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
  edit "my-full-tunnel-portal"
    set tunnel-mode enable
    set split-tunneling disable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
```

```

    next
end

```

5. Configure SSL VPN settings.

```

config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-full-tunnel-portal"
        next
    end
end

```

6. Configure SSL VPN firewall policies to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```

config firewall policy
    edit 1
        set name "sslvpn tunnel mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "sslvpn tunnel mode outgoing"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.

5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
7. After connection, all traffic except the local subnet will go through the tunnel *FGT*.
8. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN tunnel mode host check

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by tunnel mode using FortiClient with AV host check.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
 - b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See [Split tunneling settings on page 2063](#) for more information.
 - c. Select *Routing Address Override*.

- d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*.

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the [SSL VPN best practices on page 2044](#) and learn how to [Procuring and importing a signed SSL certificate on page 2721](#).

- e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
- f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn tunnel access with av check*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Choose an *Outgoing Interface*. In this example, *port1*.
 - e. Set the *Source* to *all* and group to *sslvpngroup*.
 - f. In this example, the *Destination* is *all*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Click OK.
6. Use CLI to configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer.

```
config vpn ssl web portal
  edit my-split-tunnel-access
    set host-check av
  next
end
```

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end
```

```
config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure user and user group.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd your-password
  next
end

config user group
  edit "sslvpngroup"
    set member "vpnuser1"
  next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
  edit "my-split-tunnel-portal"
    set tunnel-mode enable
    set split-tunneling enable
    set split-tunneling-routing-address "192.168.1.0"
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
  next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "Fortinet_Factory"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "full-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "my-split-tunnel-portal"
    next
  end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
```

```

        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

7. Configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer:

```

config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end

```

To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to *192.168.1.0* goes through the tunnel. Other traffic goes through local gateway.
8. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN split DNS

SSL VPN clients in tunnel mode can enable the following settings to split DNS traffic:

- Resolve DNS requests for a specific domain, or suffix, using specific DNS servers.
- Resolve all other DNS requests using a DNS server configured in the SSL VPN settings. This DNS server can be the same as the client system DNS server, or another DNS server.

Administrators typically configure SSL VPN clients to use DNS servers that are behind the FortiGate on the internal network. This will require DNS traffic to traverse the SSL VPN tunnel.

Configuring SSL VPN DNS servers to use DNS suffixes

The `dns-suffix` setting under `config vpn ssl settings` is used to specify domains for SSL VPN DNS servers in the tunnel mode configuration. This setting can only be configured in the CLI.

The DNS servers and suffixes configured under `config vpn ssl settings` have a global scope, and apply only to SSL VPN portals that do not have their own DNS server configuration.

To configure DNS servers for all SSL VPN portals:

```
config vpn ssl settings
    set dns-suffix domain1.com
    set dns-server1 10.10.10.10
    set dns-server2 10.10.10.11
end
```

SSL VPN portals configured with their own DNS servers and suffixes under `config vpn ssl web portal` override the settings configured under `config vpn ssl settings`.

To configure DNS servers for a specific SSL VPN portal in split tunnel mode:

```
config vpn ssl web portal
    edit "full-access"
        set dns-suffix domain2.com
        set dns-server1 10.10.10.12
        set dns-server2 10.10.10.13
        set split-tunneling enable
    next
end
```

Only DNS requests that match DNS suffixes use the DNS servers configured in the VPN. Due to iOS limitations, the DNS suffixes are not used for searching as in Windows. Using short (non-FQDN) names may not be possible.

Configuring SSL VPN DNS servers for tunnel mode using DNS split tunneling

The DNS split tunneling setting can be used to configure domains that apply to a specific SSL VPN portal by specifying primary and secondary DNS servers to be used to resolve specific suffixes. This setting can be configured in the GUI and CLI. In the following example, DNS split tunneling is configured on the default tunnel-access portal with two DNS entries.

To configure DNS split tunneling in the GUI:

1. Go to *VPN > SSL-VPN Portals* and double-click *tunnel-access* to edit the portal.
2. In the *Tunnel Mode Client Options* section, enable *DNS Split Tunneling*.
3. In the *Split DNS* table, click *Create New*. The *New DNS Entry* pane opens.
4. Configure the first DNS entry:
 - a. For *Domains*, enter *domain1.com*.
 - b. Set the *Primary DNS Server* to *10.10.10.10*.
 - c. Set the *Secondary DNS Server* to *10.10.10.11*.

Edit SSL-VPN Portal

New DNS Entry

Domains: domain1.com

Primary DNS Server: 10.10.10.10

Secondary DNS Server: 10.10.10.11

OK Cancel

- d. Click OK.
5. Configure the second DNS entry:
 - a. Click *Create New*.
 - b. For *Domains*, enter *domain2.com*.
 - c. Set the *Primary DNS Server* to *10.10.10.12*.
 - d. Set the *Secondary DNS Server* to *10.10.10.13*.
 - e. Click OK.

6. Click *OK* to save the portal settings.

To configure DNS split tunneling in the CLI:

```
config vpn ssl web portal
  edit "tunnel-access"
    set dns-suffix "domain0.com"
    set dns-server1 10.10.10.8
    set dns-server2 10.10.10.9
    set split-tunneling enable
```

```

config split-dns
  edit 1
    set domains "domain1.com"
    set dns-server1 10.10.10.10
    set dns-server2 10.10.10.11
  next
  edit 2
    set domains "domain2.com"
    set dns-server1 10.10.10.12
    set dns-server2 10.10.10.13
  next
end
next
end

```

Split tunneling settings

SSL VPN clients in tunnel mode can choose between the following settings to split the traffic:

Option	Description
<i>Tunnel mode</i>	<ul style="list-style-type: none"> • <i>Disabled</i>: All client traffic will be directed over the SSL-VPN tunnel. • <i>Enabled Based on Policy Destination</i>: Only client traffic in which the destination matches the destination of the configured firewall policies will be directed over the SSL-VPN tunnel. • <i>Enabled for Trusted Destinations</i>: Only client traffic which does not match explicitly trusted destination will be directed over the SSL-VPN tunnel.

To configure split tunneling in the GUI:

1. Go to *VPN > SSL-VPN Portals*.
2. Click *Create New* or *Edit* an existing portal.
3. Enable *Tunnel Mode* and select one of the *Split tunneling* settings.
4. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

5. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
6. Configure other necessary parameters as required.
7. Click *OK*.

To configure split tunneling in the CLI:

```

config vpn ssl web portal
  edit "tunnel-access"
    set tunnel-mode enable

```

```

set split-tunneling {enable | disable}
set split-tunneling-routing-negate {enable | disable}
set split-tunneling-routing-address <name1> <name2> ...
set ip-pools <name1> <name2> ...
next
end

```

The command `split-tunneling-routing-negate` is only available on the CLI after `split-tunneling` is enabled.

`split-tunneling-routing-negate` is disabled by default and corresponds to the *Enabled Based on Policy Destination* option on the GUI.

`split-tunneling-routing-negate enable` corresponds to the *Enabled for Trusted Destinations* option on the GUI.

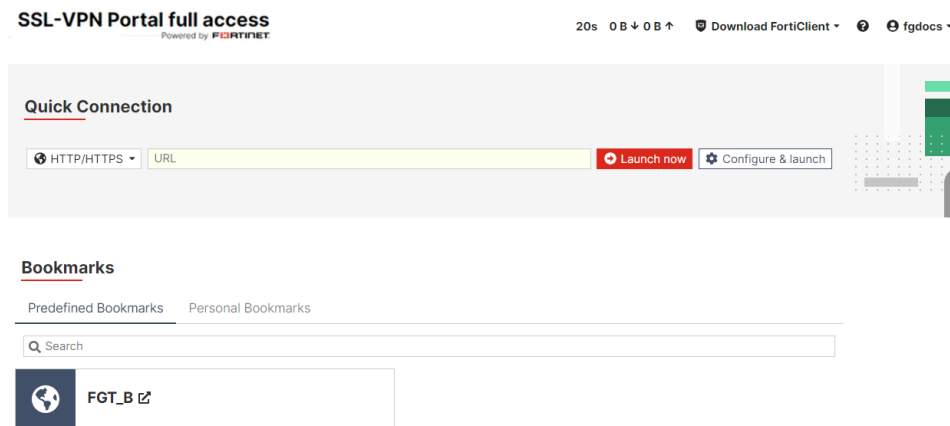

SSL VPN web mode

A user must have valid username and password credentials to log in to an SSL VPN web portal in addition to other multi-factor authentication components that may be configured, such as FortiTokens.

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Use this mode if you require:

- A clientless solution where all remote services are accessed through a web portal
- Tight control over the contents of the web portal
- Limited services provided to the remote users

After logging in, the web portal page appears:

A web portal includes the following features:

- The session information is displayed in the right corner of the top banner. This includes the elapsed time since logging in, and the volume of inbound and outbound HTTP and HTTPS traffic.
- The *Launch FortiClient* button appears if FortiClient is installed. Clicking the button opens the FortiClient *Remote Access* tab, but FortiClient does not automatically create a VPN connection based on the web mode connection information.
- The *Download FortiClient* button provides access to download the FortiClient application for various operating systems.

- The *Bookmarks* widget includes links to network resources (administrator-defined bookmarks), and users can create their own bookmarks.
- The *Quick Connection* dropdown menu enables a connection to network resources without using or creating a bookmark.

The following topics provide information about SSL VPN web mode:

- [Web portal configurations on page 2065](#)
- [Quick Connection tool on page 2068](#)
- [SSL VPN bookmarks on page 2069](#)
- [SSL VPN web mode for remote user on page 2072](#)
- [Customizing the RDP display size on page 2075](#)
- [Showing the SSL VPN portal login page in the browser's language on page 2078](#)
- [SSL VPN custom landing page on page 2079](#)

Web portal configurations

An SSL VPN web portal enables users to access network resources through a secure channel using a web browser. System administrators can configure log in privileges for users and which network resources are available to these users. The portal configuration determines what the user sees when they log in to the portal. Both system administrators and the users have the ability to customize the SSL VPN portal.

There are three predefined default web portal configurations available:

- **full-access:** connecting clients can either access protected resources through the SSL VPN web portal, or use FortiClient to connect through tunnel mode.
- **tunnel-access:** connecting clients can only access protected resources with FortiClient connecting through tunnel mode.
- **web-access:** connecting clients can only access protected resources through the SSL VPN web portal.

Custom web portals can also be configured.

To configure a custom web portal:

1. Go to *VPN > SSL-VPN Portals* and click *Create New*.
2. Configure the following settings as needed:

GUI option	Description
<i>Name</i>	Enter the portal name.
<i>Limit Users to One SSL-VPN Connection at a Time</i>	This option is disabled by default. When enabled, once a user logs in to the portal, they cannot go to another system and log in with the same credentials again.
<i>Tunnel Mode</i>	
<i>Split tunneling</i>	There are three options: <ul style="list-style-type: none"> • <i>Disabled:</i> all client traffic will be directed over the SSL VPN tunnel. • <i>Enabled Based on Policy Destination:</i> only client traffic where the destination matches the

GUI option	Description
	<p>destination of the configured firewall policies will be directed over the SSL VPN tunnel.</p> <ul style="list-style-type: none"> • <i>Enabled for Trusted Destinations</i>: only client traffic that does not match explicitly trusted destinations will be directed over the SSL VPN tunnel.
<i>Routing Address Override</i>	<p>When <i>Split tunneling</i> is set to <i>Enabled Based on Policy Destination</i>, the IPv4 firewall address selected overrides the firewall policy destination addresses to control split tunnel access.</p> <p>When <i>Split tunneling</i> is set to <i>Enabled for Trusted Destinations</i>, the IPv4 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.</p>
<i>Source IP Pools</i>	Select an IP pool for users to acquire an IP address when connecting to the portal.
<i>IPv6 Tunnel Mode</i>	When enabled, these settings determine how tunnel mode clients are assigned IPv6 addresses.
<i>IPv6 split tunneling</i>	The same three options are available as in <i>Tunnel Mode</i> .
<i>IPv6 Routing Address Override</i>	<p>When <i>Split tunneling</i> is set to <i>Enabled Based on Policy Destination</i>, the IPv6 firewall address selected overrides the firewall policy destination addresses to control split tunnel access.</p> <p>When <i>Split tunneling</i> is set to <i>Enabled for Trusted Destinations</i>, the IPv6 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.</p>
<i>Source IPv6 Pools</i>	Select an IP pool for users to acquire an IP address when connecting to the portal.
<i>Tunnel Mode Client Options</i>	The following options affect how FortiClient behaves when connected to the VPN tunnel.
<i>Allow client to save password</i>	When enabled and if the user selects this option, their password is stored on their computer and will automatically populate each time they connect to the VPN.
<i>Allow client to connect automatically</i>	When enabled and if the user selects this option, when FortiClient launches (such as after a reboot or system start up), FortiClient will automatically attempt to connect to the VPN.

GUI option		Description
	<i>Allow client to keep connections alive</i>	When enabled and if the user selects this option, FortiClient will try to reconnect once it detects that the VPN connection is unexpectedly down (not manually disconnected by the user).
	<i>DNS Split Tunneling</i>	When enabled, the <i>Split DNS</i> table is visible, where new DNS entries can be created. See SSL VPN split DNS on page 2060 for more details.
<i>Host Check</i>		When enabled, the type of host checking performed on endpoints can be configured (see Configuring OS and host check on page 2180).
	<i>Type</i>	There are three options: <ul style="list-style-type: none"> • <i>Realtime AntiVirus</i>: check for antivirus software recognized by the Windows Security Center. • <i>Firewall</i>: check for firewall software recognized by the Windows Security Center. • <i>Enable both</i>: check for antivirus and firewall software recognized by the Windows Security Center.
<i>Restrict to Specific OS Versions</i>		When enabled, access to certain operating systems can be denied or forced to check for an update. By default, all operating systems in the table are allowed (see Configuring OS and host check on page 2180).
<i>Web Mode</i>		Enable this option to configure the web portal settings.
	<i>Portal Message</i>	Enter a message that appears at the top of the web portal screen (default = <i>SSL-VPN Portal</i>).
	<i>Theme</i>	Select a color theme from the dropdown.
	<i>Show Session Information</i>	Enable to display session information in the top banner of the web portal (username, amount of time logged in, and traffic statistics).
	<i>Show Connection Launcher</i>	Enable to display the <i>Quick Connection</i> button.
	<i>Show Login History</i>	Enable to display the user's login history (<i>History</i>).
	<i>User Bookmarks</i>	Enable to allow users to add their own bookmarks (<i>New Bookmark</i>).
	<i>Rewrite Content IP/UI/</i>	Enable contents rewrite for URIs containing IP-address/ui/.
	<i>RDP/VNC clipboard</i>	Enable to support RDP/VPC clipboard functionality.

GUI option	Description
<i>Predefined Bookmarks</i>	Use the table to create and edit predefined bookmarks. See To create a predefined administrator bookmark in FortiOS: on page 2071 for more details.
<i>FortiClient Download</i>	Enable this option to display the <i>Download FortiClient</i> button.
<i>Download Method</i>	Select either <i>Direct</i> or <i>SSL-VPN Proxy</i> as the method to download FortiClient.
<i>Customize Download Location</i>	Enable to configure a custom download location for <i>Windows</i> or <i>Mac</i> .

3. Click **OK**.

By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the *SSL-VPN Settings* page of the GUI, or disabling browser-language detection in the CLI. See [Showing the SSL VPN portal login page in the browser's language on page 2078](#) for more details.

Quick Connection tool

The *Quick Connection* tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. Select the connection type.
2. Enter the required information, such as the IP address or URL of the host.
3. Click *Configure & launch*.

In a VNC session, to send Ctrl+Alt+Del, press *F8* then select *Send Ctrl-Alt-Delete*.

RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the *Host* field using the following format: `<IP address> -m <locale>`

The available options are:

ar	Arabic	fr-be	Belgian French	no	Norwegian
da	Danish	fr-ca	Canadian French	pl	Polish
de	German	fr-ch	Swiss French	pt	Portuguese
de-ch	Swiss German	hr	Croatian	pt-br	Brazilian Portuguese
en-gb	British English	hu	Hungarian	ru	Russian
en-uk	UK English	it	Italian	sl	Slovenian
en-us	US English	ja	Japanese	sv	Sudanese
es	Spanish	lt	Lithuanian	tk	Turkmen
fi	Finnish	lv	Latvian	tr	Turkish
fr	French	mk	Macedonian		

SSL VPN bookmarks

The *Bookmarks* widget displays bookmarks configured by administrators and users. Administrator bookmarks cannot be edited, and they are configured in FortiOS. Users can add, edit, and delete their own bookmarks within the web portal.

The FortiGate forwards client requests to servers on the internet or internal network. To use the web portal applications, add the URL, IP address, or name of the server application to the *Bookmarks* list. Once a bookmark is created, click the bookmark icon to initiate a session.

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
<i>Preconnection ID</i>					✓			
<i>Preconnection Blob</i>					✓			
<i>Load Balancing Information</i>					✓			
<i>Restricted Admin Mode</i>					✓			

* = This setting can only be configured by an administrator.

To create a user bookmark in the web portal:

1. In the *Personal Bookmarks* section, click *Create new bookmark*.
2. Enter a *Name*.
3. Select a bookmark type and configure the type-based settings.
4. Click *Save*.

To create a predefined administrator bookmark in FortiOS:

1. Go to *VPN > SSL-VPN Portals* and double-click a portal to edit it.
2. In the *Predefined Bookmarks* table, click *Create New*. The *New Bookmark* pane appears.
3. Enter a *Name*.
4. Select a bookmark type and configure the type-based settings.
5. Click *OK* to save the bookmark settings.
6. Click *OK* to save the portal settings.

Configuring group-based SSL VPN bookmarks

Administrators can add bookmarks for users in the same user group. SSL VPN will only output the matched group name entry to the client. This setting can only be configured in the CLI.

To add bookmarks for users in the same user group:

1. Enable group bookmarks in the web portal settings:

```
config vpn ssl web portal
  edit <name>
    set user-group-bookmark enable
  next
end
```

2. Configure the user group bookmark:

```
config vpn ssl web user-group-bookmark
  edit <name>
    config bookmarks
      edit <name>
        ...
      next
    end
```

```

next
end

```

SSL VPN web mode for remote user

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by web mode using a web browser.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create a web mode only portal *my-web-portal*.
 - b. Set *Predefined Bookmarks for Windows server* to type *RDP*.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*.

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the [SSL VPN best practices on page 2044](#) and learn how to [Procuring and importing a signed SSL certificate on page 2721](#).

- e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-Web-portal*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn web mode access*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Choose an *Outgoing Interface*. In this example, *port1*.
 - e. Set the *Source* to *all* and group to *sslvpngroup*.
 - f. In this example, the *Destination* is the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-web-portal"
```

```

        set web-mode enable
    config bookmark-group
        edit "gui-bookmarks"
            config bookmarks
                edit "Windows Server"
                    set apptype rdp
                    set host "192.168.1.114"
                    set port 3389
                    set logon-user "your-windows-server-user-name"
                    set logon-password your-windows-server-password
                next
            end
        next
    end
next
end

```

5. Configure SSL VPN settings.

```

config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-web-portal"
        next
    end
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

To see the results:

1. In a web browser, log into the portal <https://172.20.120.123:10443> using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see [Quick Connection tool on page 2068](#) for more information.

3. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* to view the details for the SSL entry.

Customizing the RDP display size

The RDP display size (width and height settings) can be customized for SSL VPN web mode when creating a new connection or bookmark. Administrators can also specify the display size when preconfiguring bookmarks.

To configure the default window dimensions in an RDP web portal:

```
config vpn ssl web portal
  edit <name>
    set default-window-width <integer>
    set default-window-height <integer>
  next
end
```

default-window-width <integer>	Set the default RDP screen width, in pixels (0 - 65535, default = 1024).
default-window-height <integer>	Set the default RDP screen height, in pixels (0 - 65535, default = 768).

Example

In this example, a user has a monitor with a resolution of 1920 × 1080. The user creates two bookmarks for RDP servers with different resolutions:

- Windows 7: 1360 × 768
- Ubuntu 20.04: 800 × 600

To customize the RDP bookmark display size:

1. Log in to the SSL VPN web portal.
2. Create a new personal RDP bookmark (+ *New Bookmark*), or hover over an existing bookmark and click the edit (pencil) icon.

3. Set the *Resolution width* and *height* fields as required.**a. Windows 7: 1360 width and 768 height.**

New Bookmark

Protocol type	<input type="text" value="RDP"/>
Name	<input type="text" value="RDP_win7"/>
Host	<input type="text" value="172.18.58.94"/>
Port	<input type="text" value="3389"/>
Description	<input type="text"/>
Use SSL-VPN credentials	<input checked="" type="checkbox"/>
Username	<input type="text" value="fosqa"/>
Password	<input type="password" value="....."/>
Color depth per pixel	<input type="text" value="32bits per pixel"/>
Resolution	<input type="text" value="1360"/> width <input type="text" value="768"/> height
Keyboard layout	<input type="text" value="English, United States."/>
Security	<input type="text" value="Standard RDP encryption"/>
Send preconnection ID	<input checked="" type="checkbox"/>
Load balancing information	<input type="text"/>
Restricted admin mode	<input checked="" type="checkbox"/>

b. Ubuntu 20.04: 800 width and 600 height.

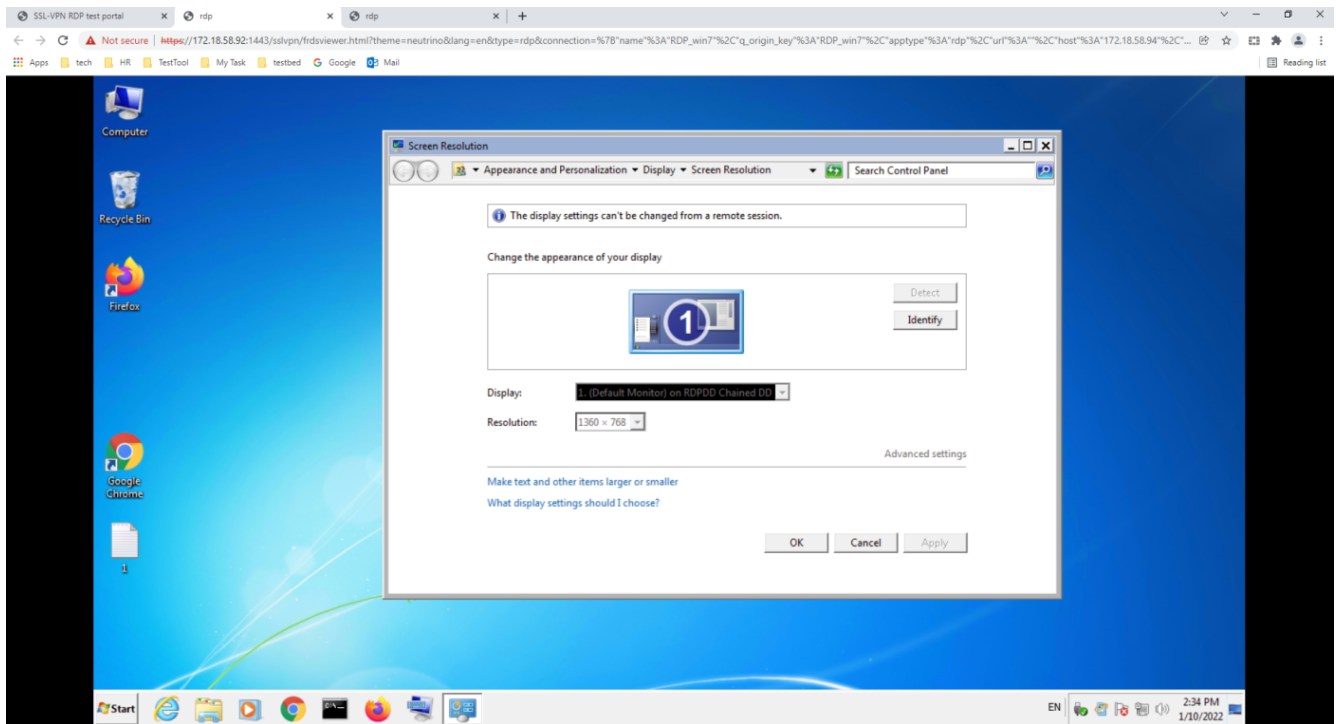

New Bookmark

Protocol type	<input type="text" value="RDP"/>
Name	<input type="text" value="RDP_ubuntu"/>
Host	<input type="text" value="172.18.58.109"/>
Port	<input type="text" value="3389"/>
Description	<input type="text"/>
Use SSL-VPN credentials	<input checked="" type="checkbox"/>
Username	<input type="text" value="auto"/>
Password	<input type="password" value="....."/>
Color depth per pixel	<input type="text" value="32bits per pixel"/>
Resolution	<input type="text" value="800"/> width <input type="text" value="600"/> height
Keyboard layout	<input type="text" value="English, United States."/>
Security	<input type="text" value="Standard RDP encryption"/>
Send preconnection ID	<input checked="" type="checkbox"/>
Load balancing information	<input type="text"/>
Restricted admin mode	<input checked="" type="checkbox"/>

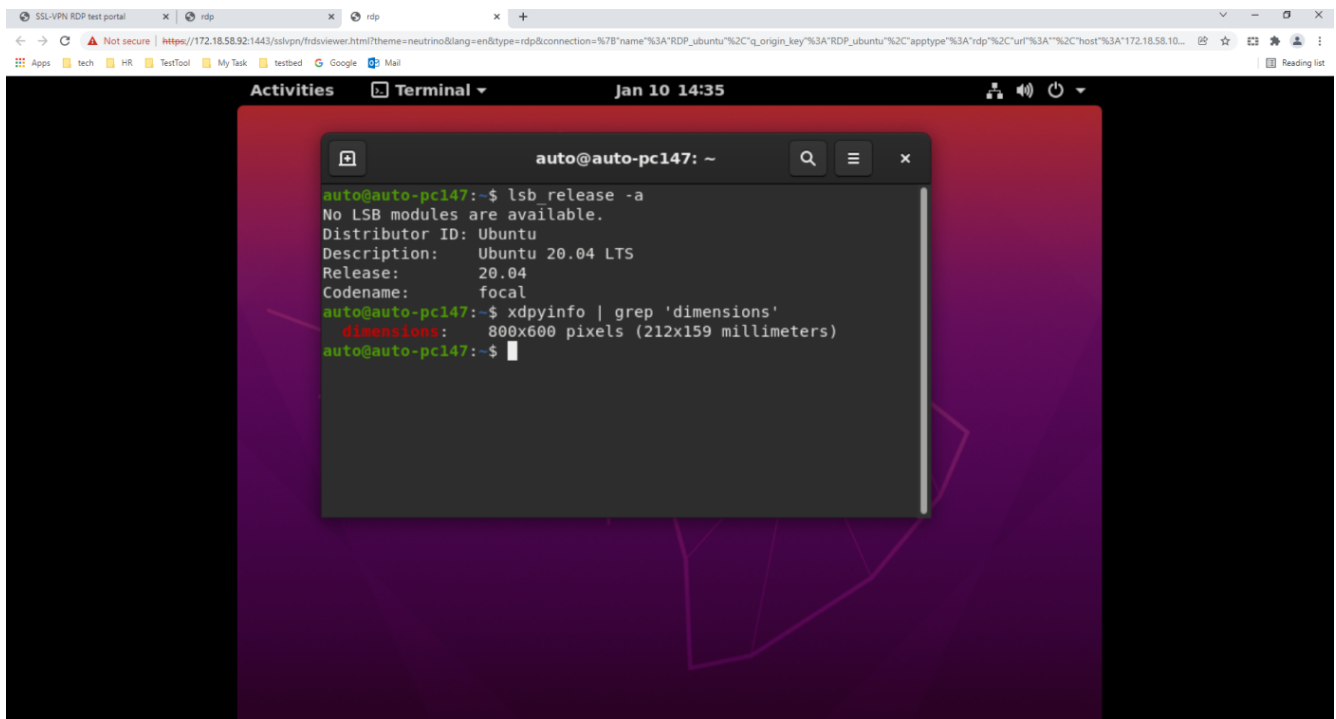

4. Click Save.**Verification:**

When the user connects to the RDP servers using the bookmarks, the customized screen resolutions are applied regardless of the client PC's screen resolution (1920 × 1080).

Windows 7:

Ubuntu 20.04:

To view the bookmarks created by the user:

```
show vpn ssl web user-bookmark
config vpn ssl web user-bookmark
```

```

edit "rdp_user#"
  config bookmarks
    edit "RDP_win7"
      set apptype rdp
      set host "172.18.58.94"
      set port 3389
      set logon-user "fosqa"
      set logon-password "*****"
      set color-depth 32
      set width 1360
      set height 768
    next
    edit "RDP_ubuntu"
      set apptype rdp
      set host "172.18.58.109"
      set port 3389
      set logon-user "auto"
      set logon-password "*****"
      set color-depth 32
      set width 800
      set height 600
    next
  end
end

```

Showing the SSL VPN portal login page in the browser's language

By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the *SSL-VPN Settings* page of the GUI, or disabling `browser-language-detection` in the CLI:

```

config vpn ssl settings
  set browser-language-detection disable
end

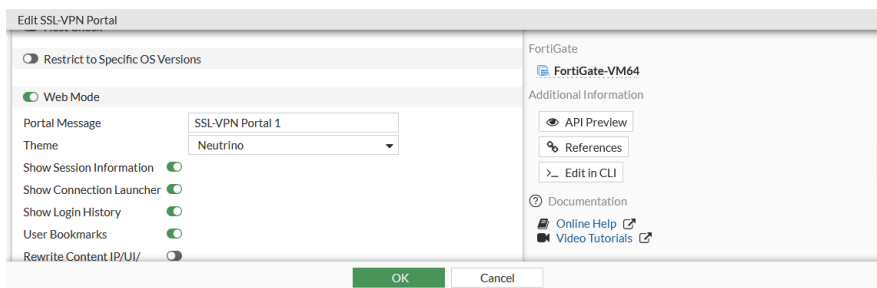

```

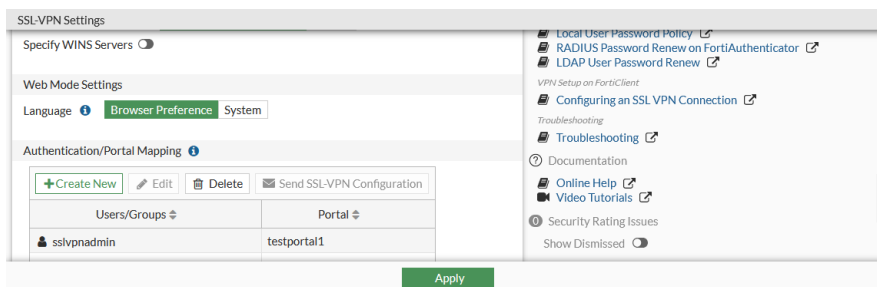

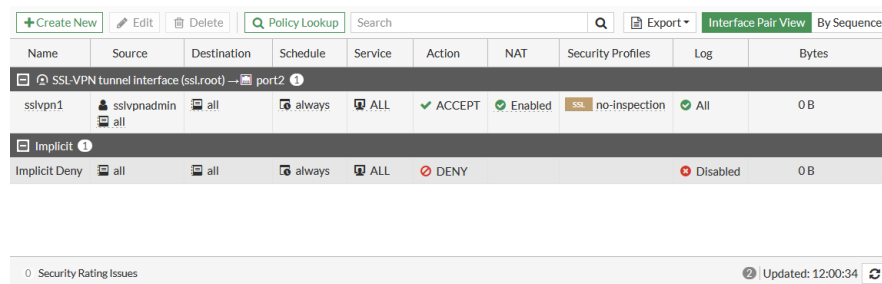

In this example, the `ssl/vpnadmin` user account is used for SSL VPN connections on the *testportal1* SSL VPN portal. The account is shared by users from different countries that use different browsers and different languages in their browsers. The user on PC1 uses Chrome in English, and the user on PC2 uses Edge in Simplified Chinese. When a user logs in to the SSL VPN web portal, all of the pages are shown in the same language as their browser.

To configure the SSL VPN portal to use the client's browser language:

1. Configure the SSL VPN portal:
 - a. Go to *VPN > SSL-VPN Portals* and edit the SSL VPN portal.
For information about configuring SSL VPN portals, see [SSL VPN on page 2044](#).

b. Enable *Web Mode*.c. Click *OK*.

2. Set the language preference:

a. Go to *VPN > SSL-VPN Settings*.b. Under *Web Mode Settings*, set *Language* to *Browser Preference*.c. Click *Apply*.3. Add the *sslvpnadmin* user to the policy used by the SSL VPN portal.

4. Confirm that the configuration works:

- When the user on PC1 logs in to the SSL VPN portal using Chrome in English, all of the pages are shown in English.
- When the user on PC2 logs in to the SSL VPN portal using Edge in Simplified Chinese, all of the pages are shown in Simplified Chinese.

SSL VPN custom landing page

An SSL VPN web mode user can log in to the web portal and be redirected to a custom landing page. The custom landing page can be configured in *VPN > SSL-VPN Portals* by setting the portal *Landing page* to *Custom* or by using the command `config landing-page`.

The landing page can accept SSO credentials as well as SSO from form data. This allows administrators to streamline web application access for their users. The custom redirected portal can also listen for a logout URL so that when users log out from the web application, they are also logged out from the SSL VPN web connection.

Example

In the following example, the SSL VPN web portal settings are configured so that the URL of the custom landing page of FGT_A is set to the FGT_B login page. Therefore, when a web user is logging into FGT_A's SSL VPN web portal, they will automatically be redirected to FGT_B, where the SSO username and password are passed into the username and password input fields. This allows for single sign on of the connecting user into FGT_B through the SSL VPN.

The logout URL of FGT_A is also set to the FGT_B logout information. Therefore, the connecting user can log out of SSL VPN directly when they log out of FGT_B.

To configure a custom landing page from the CLI:

1. Configure the user and user group:

```

config user local
    edit "custom_landing_user"
        set type password
        set passwd *****
    next
end
config user group
    edit "ssl-web-group"
        set member "custom_landing_user"
    next
end

```

2. Configure the SSL VPN web portal:

```

config vpn ssl web portal
    edit "custom_landing"
        set web-mode enable
        set landing-page-mode enable
        config landing-page
            set url "https://172.16.200.2/login"
            set logout-url "https://172.16.200.2/logout"
            set sso static
            config form-data
                edit "username"
                    set value "admin"
                next
                edit "secretkey"
                    set value "1"
                next
            end
            set sso-credential alternative
            set sso-username "admin"
            set sso-password *****
        end
    end
end

```

```

    next
end

```

3. Configure the SSL VPN settings:

```

config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 2
            set users "custom_landing_user"
            set portal "custom_landing"
        next
    end
    set encrypt-and-store-password enable
end

```

4. Configure the firewall policy:

```

config firewall policy
    edit 1
        set name "testpolicy"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "ssl-web-group"
        set users "custom_landing_user"
    next
end

```

To configure a custom landing page from the GUI:

1. Configure the user and user group:
 - a. Go to *User & Authentication > User Definition* to create the `custom_landing_user` user.
 - b. Go to *User & Authentication > User Groups* to create the `ssl-web-group` user group with the member `custom_landing_user`.
2. Configure the SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals*.
 - b. Click *Create New*.
 - c. Enter `custom_landing` as the *Name*.
 - d. Enable custom *Web Mode* features:

- i. Enable *Web Mode*.
- ii. Set *Landing Page* to *Custom*.
- iii. Enter the FGT_B login page *URL*.
- iv. Enter the FGT_B *Logout URL*.
- v. Enable *SSO Credentials* and select *SSL-VPN Login*.
- vi. Enable *SSO form data* and enter the *Form key* and *Form value*.

- e. Click **OK**.
3. Configure the SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Set *Listen on Interface(s)* to *port1*.
 - c. Set *Listen on Port* to *1443*.
 - d. Set *Server Certificate* to *fgt_gui_automation*.
 - e. Create a new *Authentication/Portal Mapping* for group *ssl-web-group* mapping the portal *custom-landing*.
 - f. Click *Apply*.
4. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Configure the following settings:

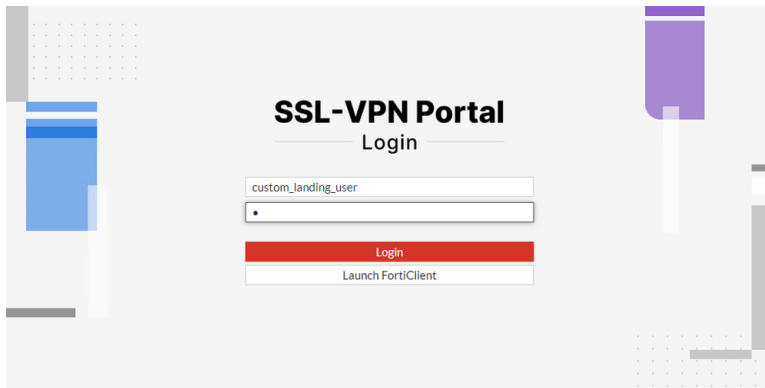

Name	testpolicy
Incoming Interface	ssl.root
Outgoing Interface	wan1
Source	all custom_landing_user ssl-web-group
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Enable *NAT*.
- d. Enable *Log Allowed Traffic* and set it to *All Sessions*.
- e. Click **OK**.

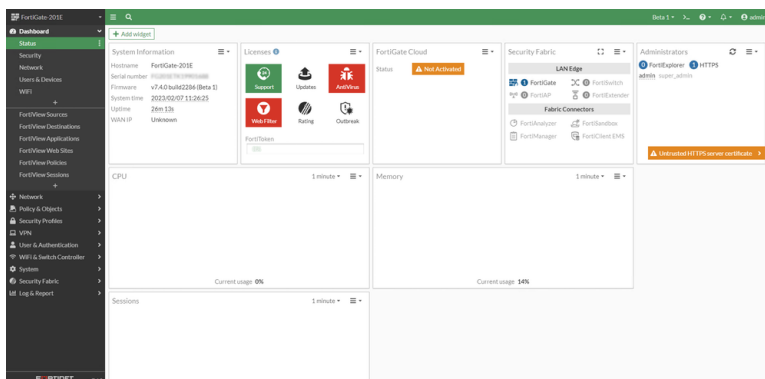

Once the SSL VPN web portal is configured, the connected user can access FGT_B through the FGT_A SSL VPN web portal.

To access FGT_B through the FGT_A SSL VPN web portal:

1. Enter your SSO credentials in the SSL VPN login fields.

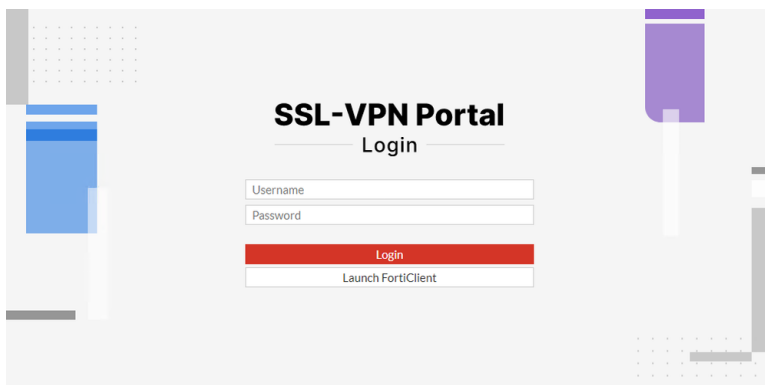

The landing page is redirected to the FGT_B GUI automatically.

2. Select *Logout* from the user menu.

The user is logged out of the SSL VPN web mode connection.

SSL VPN authentication

SSL VPN with LDAP user authentication

This is a sample configuration of SSL VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
 - a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
 - b. Go to *System > Certificates* and select *Import > CA Certificate*.
 - c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
 - d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```
3. Configure the LDAP user:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Specify *Name* and *Server IP/Name*.
 - c. Specify *Common Name Identifier* and *Distinguished Name*.
 - d. Set *Bind Type* to *Regular*.
 - e. Specify *Username* and *Password*.
 - f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
 - g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
4. Configure user group:
 - a. Go to *User & Authentication > User Groups* to create a user group.
 - b. Enter a *Name*.
 - c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.

- e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
- f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
- g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
- h. Enable *NAT*.
- i. Configure any remaining firewall and security options as desired.
- j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Import CA certificate into FortiGate:

- a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
- b. Go to *System > Certificates* and select *Import > CA Certificate*.
- c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
- d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

```
config user ldap
  edit "ldaps-server"
    set server "172.20.120.161"
    set cnid "cn"
    set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
    set type regular
    set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
    set password *****
    set group-member-check group-object
```

```
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "ldaps-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Enter the *ldu1* user credentials, then click *Login*.
3. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type    Timeout    From           HTTP in/out    HTTPS in/out
  0        ldu1    1 (1)        229        10.1.100.254   0/0            0/0

SSL VPN sessions:
  Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type    Timeout    From           HTTP in/out    HTTPS in/out
  0        ldu1    1 (1)        291        10.1.100.254   0/0            0/0

SSL VPN sessions:
  Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
  0        ldu1    10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with LDAP user password renew

This is a sample configuration of SSL VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
 - a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
 - b. Go to *System > Certificates* and select *Import > CA Certificate*.
 - c. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

 - d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```

config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
  
```

3. Configure the LDAP user:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

- a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
- b. Specify *Name* and *Server IP/Name*.
- c. Specify *Common Name Identifier* and *Distinguished Name*.
- d. Set *Bind Type* to *Regular*.

- e. Specify *Username* and *Password*.
- f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
- g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
- h. To enable the `password-renew` option, use these CLI commands.

```
config user ldap
    edit "ldaps-server"
        set password-expiry-warning enable
        set password-renewal enable
    next
end
```

4. Configure user group:
 - a. Go to *User & Authentication > User Groups* to create a user group.
 - b. Enter a *Name*.
 - c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
```

```

        set ip 172.20.120.123 255.255.255.0
    next
end

```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```

config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end

```

3. Import CA certificate into FortiGate:

- a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
- b. Go to *System > Certificates* and select *Import > CA Certificate*.
- c. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.

- d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```

config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end

```

4. Configure the LDAP server:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

```

config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password *****
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
        set password-expiry-warning enable
        set password-renewal enable
    next
end

```

5. Configure user group:

```

config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end

```

6. Configure SSL VPN web portal:

```

config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end

```

7. Configure SSL VPN settings:

```

config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end

```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "ldaps-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *ldu1* credentials.
Use a user that is configured on FortiAuthenticator with *Force password change on next login*.
3. Click *Login*. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.
You are prompted to enter a new password. The prompt will timeout after 90 seconds.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
  0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
  Index   User    Source IP      Duration      I/O Bytes      Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
  0       ldu1    1(1)         291        10.1.100.254   0/0          0/0

SSL VPN sessions:
  Index   User    Source IP      Duration      I/O Bytes      Tunnel/Dest IP
  0       ldu1    10.1.100.254   9            22099/43228    10.212.134.200
```

SSL VPN with certificate authentication

This is an example configuration of SSL VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

1. [Using PKI users](#)
2. [Configuring the SSL VPN settings to require a client certificate](#)

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

Self-signed certificates are provided by default to simplify initial installation and testing. It is **HIGHLY** recommended that you acquire a signed certificate for your installation.

Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.

For more information, please review the [Use a non-factory SSL certificate for the SSL VPN portal on page 2046](#) and learn how to [Procuring and importing a signed SSL certificate on page 2721](#).

Using PKI users

When using PKI users, the FortiGate authenticates the user based on their identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring the SSL VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but SSL VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling *Require Client Certificate* (`reqclientcert`) in the SSL-VPN settings.

Configuration

In the following example, SSL VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate's SSL VPN portal.
- The CA certificate is available to be imported on the FortiGate.

To configure SSL VPN in the GUI:

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic.

- a. Go to *System > Feature Visibility* and ensure *Certificates* is enabled.
- b. Go to *System > Certificates* and select *Import > Local Certificate*.
 - Set *Type* to *Certificate*.
 - Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
 - If required, you can change the *Certificate Name*.

The server certificate now appears in the list of *Certificates*.

2. Install the CA certificate.

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

- a. Go to *System > Certificates* and select *Import > CA Certificate*.
- b. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

3. Configure PKI users and a user group.

To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
    next
end
```

Ensure that the subject matches the name of the user certificate. In this example, *User01*.

4. After you have create a PKI user, a new menu is added to the GUI:

- a. Go to *User & Authentication > PKI* to see the new user.
- b. Edit the user account.
- c. Enable *Two-factor authentication* and set a password for the account.
- d. Go to *User & Authentication > User Groups* and create a group called *sslvpngroup*.
- e. Add the PKI user *pki01* to the group.

5. Configure SSL VPN web portal.

- a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
- b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.

6. Configure SSL VPN settings.

- a. Go to *VPN > SSL-VPN Settings* and enable SSL-VPN.
- b. Set the *Listen on Interface(s)* to *wan1*.
- c. Set *Listen on Port* to *10443*.
- d. Set *Server Certificate* to the local certificate that was imported.
- e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
- f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.

7. Configure SSL VPN firewall policy.

- a. Go to *Policy & Objects > Firewall Policy*.
- b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
- c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
- d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.

- e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
- f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
- g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
- h. Enable *NAT*.
- i. Configure any remaining firewall and security options as needed.
- j. Click *OK*.

To configure SSL VPN in the CLI:

1. Configure the protected subnet:

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

2. Install the server certificate:

The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server. To import a p12 certificate, put the certificate *server_certificate.p12* on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12
<your password for PKCS12 file>
```

To check that the server certificate is installed:

```
show vpn certificate local server_certificate
```

3. Install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users. While it is easier to install the CA certificate from GUI, the CLI can be used to import a CA certificates from a TFTP server.

To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
```

To check that a new CA certificate is installed:

```
show vpn certificate ca
```

4. Configure PKI users and a user group:

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
        set two-factor enable
        set passwd *****
    next
end

config user group
    edit "sslvpngroup"
```

```
        set member "pki01"
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Installation

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the user certificate on Windows 7, 8, and 10:

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

To install the user certificate on Mac OS X:

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Enable *Client Certificate* and select the authentication certificate.
6. Save your settings.
7. Use the credentials you've set up to connect to the SSL VPN tunnel.
If the certificate is correct, you can connect.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
If the certificate is correct, you can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details for the SSL connection log.

To check the SSL VPN connection using the CLI:

```
get vpn ssl monitor
```

```
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	pki01,cn=User01		1 (1)	229	10.1.100.254	0/0 0/0
1	pki01,cn=User01		1 (1)	291	10.1.100.254	0/0 0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	pki01,cn=User01		10.1.100.254	9	22099/43228 10.212.134.200

SSL VPN with LDAP-integrated certificate authentication

This is a sample configuration of SSL VPN that requires users to authenticate using a certificate with LDAP `UserPrincipalName` checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 2242](#) and [Configuring client certificate authentication on the LDAP server on page 2256](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the server certificate:

The server certificate is used for authentication and for encrypting SSL VPN traffic.

1. Go to *System > Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System > Certificates* and select *Import > Local Certificate*.
3. Set *Type* to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.
The server certificate now appears in the list of *Certificates*.

To install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

1. Go to *System > Certificates* and select *Import > CA Certificate*.
2. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure the LDAP server:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Specify *Name* and *Server IP/Name*.
 - c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
 - d. Set *Bind Type* to *Regular*.
 - e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
 - f. Set *Password*.
 - g. Click *OK*.
3. Configure PKI users and a user group:
To use certificate authentication, use the CLI to create PKI users.

```
config user peer
  edit user1
    set ca CA_Cert_1
    set ldap-server "ldap-AD"
    set ldap-mode principal-name
  next
end
```

When you have create a PKI user, a new menu is added to the GUI:

- a. Go to *User & Authentication > PKI* to see the new user.
- b. Go to *User & Authentication > User > User Groups* and create a group *sslvpn-group*.
- c. Add the PKI peer object you created as a local member of the group.
- d. Add a remote group on the LDAP server and select the group of interest.
You need these users to be members using the LDAP browser window.

4. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpn-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpn-group*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the LDAP server:

```
config user ldap
  edit "ldap-AD"
    set server "172.18.60.206"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
    set password ldap-server-password
  next
end
```

4. Configure PKI users and a user group:

```
config user peer
  edit user1
    set ca CA_Cert_1
    set ldap-server "ldap-AD"
    set ldap-mode principal-name
  next
end

config user group
  edit "sslvpn-group"
    set member "ldap-AD" "user1"
    config match
      edit 1
        set server-name "ldap-AD"
        set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
      next
    end
  next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "sslvpn-group"
      set portal "full-access"
    next
  end
```

```
end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpn-group"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.
 - d. Enable *Client Certificate* and select the authentication certificate.
4. Save your settings.

Connecting to the VPN only requires the user's certificate. It does not require username or password.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.

A message requests a certificate for authentication.
2. Select the user certificate.

You can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > VPN Events* to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the SSL VPN connection using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```

[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206

```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the SSL VPN user and is part of the right groups.

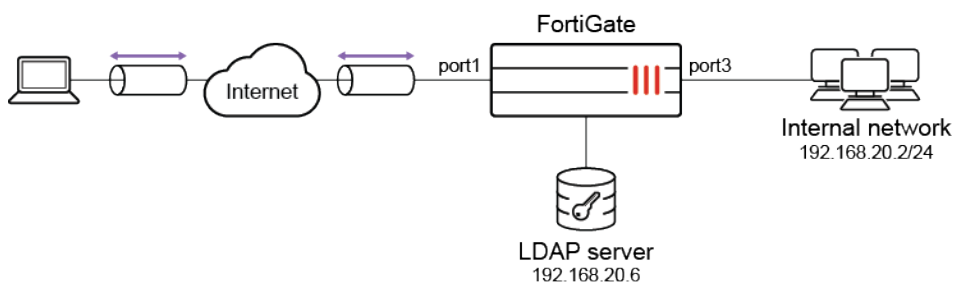

SSL VPN for remote users with MFA and user sensitivity

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to SSL VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity and accents can be ignored by disabling the `username-sensitivity` CLI command, allowing the remote user object to match any case or accents that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server, and is applied to SSL VPN authentication and the policy.

Topology

Example configuration

To configure the LDAP server:

1. Generate and export a CA certificate from the AD server .
2. Import the CA certificate into FortiGate:
 - a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
 - b. Go to *System > Certificates* and select *Import > CA Certificate*.
 - c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
 - d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Configure the following options for this example:

Name	WIN2K16-KLHOME
Server IP/Name	192.168.20.6
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Bind Type	Regular
Username	KLHOME\Administrator
Password	*****
Secure Connection	Enable
Protocol	LDAPS
Certificate	CA_Cert_1 This is the CA certificate that you imported in step 2.

The screenshot shows the 'Edit LDAP Server' configuration window in FortiGate. The configuration is as follows:

- Name:** WIN2K16-KLHOME
- Server IP/Name:** 192.168.20.6
- Server Port:** 636
- Common Name Identifier:** sAMAccountName
- Distinguished Name:** dc=KLHOME,dc=local
- Bind Type:** Regular
- Username:** KLHOME\Administrator
- Password:** (masked with asterisks)
- Secure Connection:** (checked)
- Protocol:** LDAPS
- Certificate:** CA_Cert_1

Buttons at the bottom include 'Test Connectivity', 'Test User Credentials', 'OK', and 'Cancel'. On the right side, there are links for 'FortiGate', 'FGDocs', 'Documentation', 'Online Help', and 'Video Tutorials'.

- c. Click OK.

To configure an LDAP user with MFA:

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Select *Remote LDAP User*, then click *Next*.
3. Select the just created LDAP server, then click *Next*.

4. Right click to add the selected user, then click *Submit*.
5. Edit the user that you just created.
The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the *Email Address* to the address that FortiGate will send the FortiToken to.
7. Enable *Two-factor Authentication*.
8. Set *Authentication Type* to *FortiToken*.
9. Set *Token* to a FortiToken device. See for more information.

10. Click OK.

To disable case and accent sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
  edit "fgdocs"
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTKMOBxxxxxxxxxx"
    set email-to "fgdocs@fortinet.com"
    set username-sensitivity disable
    set ldap-server "WIN2K16-KLHOME"
  next
end
```

To configure a user group with the remote user and the LDAP server:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Set the *Name* to *LDAP-USERGRP*.

3. Set *Members* to the just created remote user.
4. In the *Remote Groups* table, click *Add*:
 - a. Set *Remote Server* to the LDAP server.
 - b. Set the group or groups that apply, and right click to add them.
 - c. Click *OK*.

New User Group

Name: LDAP-USERGRP

Type: Firewall

Members: fgdocs

Remote Groups

Remote Server	Group Name
WIN2K16-KLHOME	

OK Cancel

5. Click *OK*.

To apply the user group to the SSL VPN portal:

1. Go to *VPN > SSL-VPN Settings*.
2. In the *Authentication/Portal Mapping* table, click *Create New*.
 - a. Set *Users/Groups* to the just created user group.
 - b. Configure the remaining settings as required.
 - c. Click *OK*.

SSL-VPN Settings

Authentication/Portal Mapping

Users/Groups	Realm	Portal
LDAP-USERGRP	/	tunnel-access
All Other Users/Groups	/	full-access

Apply

3. Click *Apply*.

To apply the user group to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	SSLVPNtoInternal
Incoming Interface	SSL-VPN tunnel interface (ssl.root)
Outgoing Interface	port3
Source	Address - SSLVPN_TUNNEL_ADDR1 User - LDAP-USERGRP

Destination	The address of the internal network. In this case: 192.168.20.0.
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

3. Configuring the remaining settings as required.
4. Click OK.

To configure this example in the CLI:

1. Configure the LDAP server:

```
config user ldap
    edit "WIN2K16-KLHOME"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *****
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure an LDAP user with MFA and disable case and accent sensitivity on the remote user:

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
```

```

        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end

```

3. Configure a user group with the remote user and the LDAP server:

```

config user group
    edit "LDAP-USERGRP"
        set member "fgdocs" "WIN2K16-KLHOME"
    next
end

```

4. Apply the user group to the SSL VPN portal:

```

config vpn ssl settings
    set servercert <server certificate>
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "LDAP-USERGRP"
            set portal "full-access"
        next
    end
end

```

5. Apply the user group to a firewall policy:

```

config firewall policy
    edit 5
        set name "SSLVPNtoInternal"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "SSLVPN_TUNNEL_ADDR1"
        set dstaddr "192.168.20.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups "LDAP-USERGRP"
        set nat enable
    next
end

```

Verification

To setup the VPN connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface.
 - c. If required, set the *Customize Port*.
4. Save your settings.

To test the connection with case sensitivity disabled:

1. Connect to the VPN:
 - a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
 - b. When prompted, enter your FortiToken code.
You should now be connected.

2. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User      Group   Auth Type   Timeout   From   HTTP in/out   HTTPS
in/out
  0       fgdocs    LDAP-US  16(1)       289       192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index   User      Group   Source IP   Duration   I/O Bytes   Tunnel/Dest IP
  0       fgdocs    LDAP-US  192.168.2.202 45         99883/5572
10.212.134.200
```

3. Disconnect from the VPN connection.
4. Reconnect to the VPN:
 - a. Log in to the tunnel with the username, using a different case than on the FortiGate.
 - b. When prompted, enter your FortiToken code.
You should now be connected.
5. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User      Group   Auth Type   Timeout   From   HTTP in/out   HTTPS
in/out
  0       FGDOCS    LDAP-US  16(1)       289       192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index   User      Group   Source IP   Duration   I/O Bytes   Tunnel/Dest IP
  0       FGDOCS    LDAP-US  192.168.2.202 45         99883/5572
10.212.134.200
```

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case and accent sensitivity enabled:

1. Enable case and accent sensitivity for the user:

```
config user local
  edit "fgdocs"
    set username-sensitivity enable
  next
end
```

2. Connect to the VPN

- a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
- b. When prompted, enter your FortiToken code.
You should now be connected.

3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User    Group  Auth Type  Timeout  From  HTTP in/out  HTTPS
in/out
  0      fgdocs  LDAP-US  16(1)      289      192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index  User    Group  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0      fgdocs  LDAP-US  192.168.2.202  45      99883/5572
10.212.134.200
```

1. Disconnect from the VPN connection.

2. Reconnect to the VPN:

- a. Log in to the tunnel with the username, using a different case than on the FortiGate.
You will not be prompted for your FortiToken code. You should now be connected.

3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User    Group  Auth Type  Timeout  From  HTTP in/out  HTTPS
in/out
  0      FGdocs  LDAP-US  16(1)      289      192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index  User    Group  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0      FGdocs  LDAP-US  192.168.2.202  45      99883/5572
10.212.134.200
```

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

SSL VPN with FortiToken mobile push authentication

This is a sample configuration of SSL VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Register FortiGate for FortiCare Support:
To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
 - a. Go to *Dashboard > Licenses*.
 - b. Hover the pointer on *Support* to check if FortiCare registered. If not, click it and select *Register*.
3. Add FortiToken mobile to FortiGate:
If your FortiGate has FortiToken installed, skip this step.
 - a. Go to *User & Authentication > FortiTokens* and click *Create New*.
 - b. Select *Mobile Token* and type in *Activation Code*.
 - c. Every FortiGate has two free mobile tokens. Go to *User & Authentication > FortiTokens* and click *Import Free Trial Tokens*.
4. Enable FortiToken mobile push:
To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.
 - a. Ensure *server-ip* is reachable from the Internet and enter the following CLI commands:

```
config system ftm-push
  set server-ip 172.20.120.123
  set status enable
end
```
 - b. Go to *Network > Interfaces*.
 - c. Edit the *wan1* interface.
 - d. Under *Administrative Access > IPv4*, select *FTM*.
 - e. Click *OK*.
5. Configure user and user group:
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Enter the user's *Email Address*.
 - c. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
 - d. Enable *Send Activation Code* and select *Email*.
 - e. Click *Next* and click *Submit*.
 - f. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
6. Activate the mobile token:
 - a. When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

7. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
8. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
9. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Register FortiGate for FortiCare Support.

To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

```
diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p
"your password" -T "Your Country/Region" -R "Your Reseller" -e 1
```

4. Add FortiToken mobile to FortiGate:

```
execute fortitoken-mobile import <your FTM code>
```

If your FortiGate has FortiToken installed, skip this step.

Every FortiGate has two free mobile Tokens. You can download the free token.

```
execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

5. Enable FortiToken mobile push:

- a.** To use FTM-push authentication, ensure `server-ip` is reachable from the Internet and enable FTM-push in the FortiGate:

```
config system ftm-push
    set server-ip 172.20.120.123
    set status enable
end
```

- b.** Enable FTM service on WAN interface:

```
config system interface
    edit "wan1"
        append allowaccess ftm
    next
end
```

6. Configure user and user group:

```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

7. Activate the mobile token.

When the user `sslvpnuser1` is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

8. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
```

```

        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end

```

9. Configure SSL VPN settings:

```

config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end

```

10. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *sslvpnuser1* credentials.
The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select *Approve*.
When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.

4. Save your settings.
5. Log in using the `sslvpnuser1` credentials and click *FTM Push*.
The FortiGate pushes a login request notification through the FortiToken mobile application.
6. Check your mobile device and select *Approve*.
When the authentication is approved, `sslvpnuser1` is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1 (1)	229	10.1.100.254	0/0	0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1 (1)	291	10.1.100.254	0/0	0/0

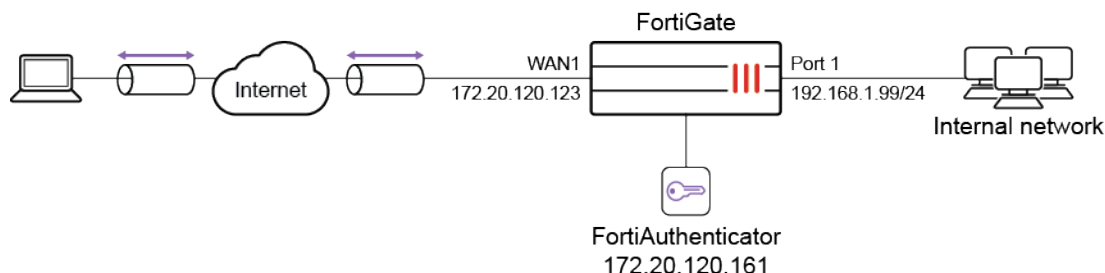

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
 - a. On the FortiAuthenticator, go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
 - b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
 - c. Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
 - d. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
 - a. On the FortiAuthenticator, go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client *OfficeServer*.
 - b. Enter the FortiGate IP address and set a *Secret*.
The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
 - c. Set *Realms* to *local | Local users*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Addresses* and create an address for internal subnet *192.168.1.0*.
2. Create a RADIUS user and user group .
 - a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
 - b. For *Name*, use *FAC-RADIUS*.
 - c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
 - d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
 - e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
 - f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
 - g. For *Name*, use *SSLVPNGroup*.
 - h. In *Remote Groups*, click *Add*.
 - i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
 - j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.

4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. *Incoming Interface* must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
 - e. Set the *Source > Address* to *all* and *Source > User* to *sslvpngroup*.
 - f. Set *Destination > Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure the remaining options as required.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Create a RADIUS user and user group.

```
config user radius
  edit "FAC-RADIUS"
    set server "172.20.120.161"
    set secret <FAC client secret>
```

```

        next
    end

    config user group
        edit "sslvpngroup"
            set member "FAC-RADIUS"
        next
    end

```

4. Configure SSL VPN web portal.

```

config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end

```

5. Configure SSL VPN settings.

```

config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *sslvpnuser1* credentials.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set the connection name.
 - Set *Remote Gateway* to *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials and check that you are logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1 (1)	229	10.1.100.254	0/0	0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
-------	------	-----------	----------	-----------	----------------

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1 (1)	291	10.1.100.254	0/0	0/0

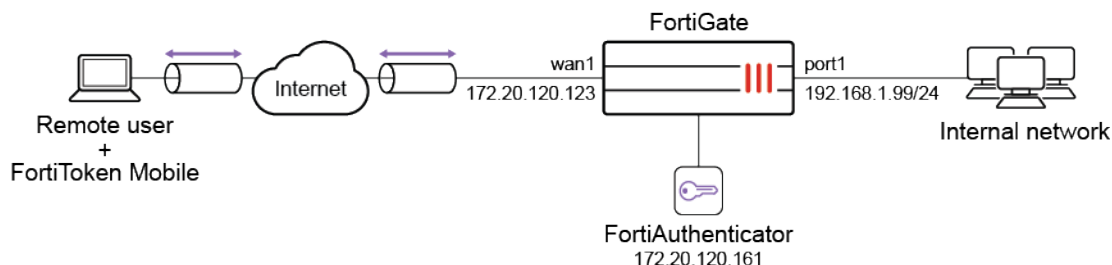

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

- On the FortiAuthenticator, go to *System > Administration > System Access* and configure a *Public IP/FQDN for FortiToken Mobile*. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the *FortiToken Mobile API* service enabled.
- Add a FortiToken mobile license on the FortiAuthenticator:
 - Go to *Authentication > User Management > FortiTokens*.
 - Click *Create New*.
 - Set *Token type* to *FortiToken Mobile* and enter the *FortiToken Activation codes*.
- Create the RADIUS client (FortiGate) on the FortiAuthenticator:
 - Go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client (*OfficeServer*).
 - Enter the FortiGate IP address and set a *Secret*.
The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
 - Set *Authentication method* to *Enforce two-factor authentication*.
 - Select *Enable FortiToken Mobile push notifications authentication*.
 - Set *Realms* to *local | Local users*.
- Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:
 - Go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
 - Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
 - Enable *Token-based authentication* and select to deliver the token code by *FortiToken*.
 - Select the FortiToken added from the FortiToken Mobile dropdown menu.
 - Set *Delivery method* to *Email* and fill in the *User Information* section.
 - Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
 - Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
- Install the FortiToken mobile application on your Android or iOS smartphone.
The FortiAuthenticator sends the FortiToken mobile activation to the user's email address.
- Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user and user group:
 - a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
 - b. For *Name*, use *FAC-RADIUS*.
 - c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
 - d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
 - e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
 - f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
 - g. For *Name*, use *SSLVPNGroup*.
 - h. In *Remote Groups*, click *Add*.
 - i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
 - j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.

- i. Configure any remaining firewall and security options as desired.
- j. Click OK.

To configure SSL VPN using the CLI:**1. Configure the interface and firewall address:**

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Create a RADIUS user and user group:

```
config user radius
  edit "FAC-RADIUS"
    set server "172.20.120.161"
    set secret <FAC client secret>
  next
end

config user group
  edit "sslvpngroup"
    set member "FAC-RADIUS"
  next
end
```

4. Configure SSL VPN web portal:

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
```

```

set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
set source-interface "wan1"
set source-address "all"
set default-portal "web-access"
config authentication-rule
    edit 1
        set groups "sslvpngroup"
        set portal "full-access"
    next
end
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *sslvpnuser1* credentials.
The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select *Approve*.
When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example: *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.
The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
6. Check your mobile device and select *Approve*.
When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
```

```
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1(1)	229	10.1.100.254	0/0	0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
-------	------	-----------	----------	-----------	----------------

To check the tunnel login on CLI:

```
get vpn ssl monitor
```

```
SSL VPN Login Users:
```

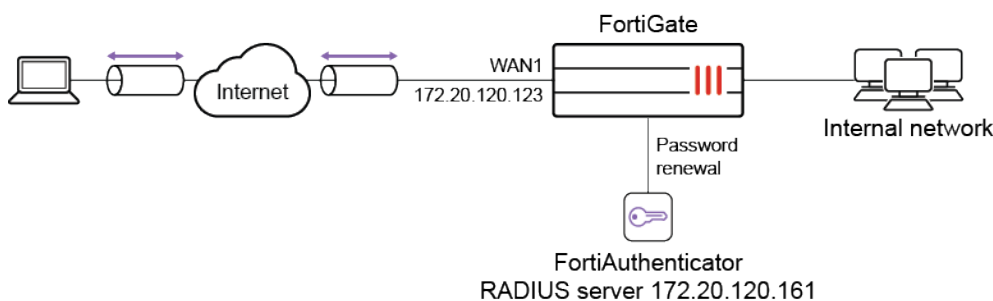

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1(1)	291	10.1.100.254	0/0	0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of SSL VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user *test1* is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology**Sample configuration**

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user.
 - a. Go to *User & Authentication > RADIUS Servers* to create a user.
 - b. Set *Authentication method* to *MS-CHAP-v2*.
 - c. Enter the *IP/Name* and *Secret*.
 - d. Click *Create*.
Password renewal only works with the MS-CHAP-v2 authentication method.
 - e. To enable the `password-renew` option, use these CLI commands.

```
config user radius
  edit "fac"
    set server "172.20.120.161"
    set secret <fac radius password>
    set auth-type ms_chap_v2
    set password-renewal enable
  next
end
```
3. Configure user group.
 - a. Go to *User & Authentication > User Groups* to create a user group.
 - b. For the *Name*, enter *fac-group*.
 - c. In *Remote Groups*, click *Add* to add *Remote Server* you just created.
4. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *fac-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *fac-group*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.

- g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
- h. Enable *NAT*.
- i. Configure any remaining firewall and security options as desired.
- j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure the RADIUS server.

```
config user radius
  edit "fac"
    set server "172.18.58.107"
    set secret <fac radius password>
    set auth-type ms_chap_v2
    set password-renewal enable
  next
end
```

4. Configure user group.

```
config user group
  edit "fac-group"
    set member "fac"
  next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
```

```

    next
end

```

6. Configure SSL VPN settings.

```

config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "fac-group"
            set portal "full-access"
        next
    end
end

```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "fac-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *test1* credentials.
Use a user which is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set the connection name.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.

- Log in using the *test1* credentials.
You are prompted to enter a new password.

To check the SSL VPN connection using the GUI:

- Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
- Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
- Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
```

SSL VPN Login Users:

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	test1	1 (1)	229	10.1.100.254	0/0	0/0

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	test1	10.1.100.254	9	22099/43228	10.212.134.200

To check the tunnel login using the CLI:

```
get vpn ssl monitor
```

SSL VPN Login Users:

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	test1	1 (1)	291	10.1.100.254	0/0	0/0

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	test1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS on Windows NPS

This is an example configuration of SSL VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example

The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the SSL-VPN connection is established once the authentication is successful.

Configure SSL-VPN with RADIUS on Windows NPS in the GUI

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To add the RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *rad-server*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.

New RADIUS Server

Name: rad-server

Authentication method: Default Specify

NAS IP:

Include in every user group: ☒

Primary Server

IP/Name: 192.168.20.6

Secret: *****

Test Connectivity

Test User Credentials

Secondary Server

IP/Name:

Test Connectivity

Test User Credentials

OK Cancel

7. Click *OK*.

To configure a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Set *Name* to *rad-group*.

- Under *Remote Groups*, click *Add* and add the *rad-server*.

New User Group

Name: rad-group

Type: Firewall

Members: +

Remote Groups

Remote Server	Group Name
rad-server	

OK Cancel

- Click *OK*.

To configure SSL VPN settings:

- Go to *VPN > SSL-VPN Settings*.
- Select the *Listen on Interface(s)*, in this example, *port1*.
- Set *Listen on Port* to *10443*.
- If you have a server certificate, set *Server Certificate* to the authentication certificate.
- Under *Authentication/Portal Mapping*:
 - Edit *All Other Users/Groups* and set *Portal* to *web-access*.
 - Click *Create New* and create a mapping for the *rad-group* user group with *Portal* set to *full-access*.

New Authentication/Portal Mapping

Users/Groups: rad-group

Portal: full-access

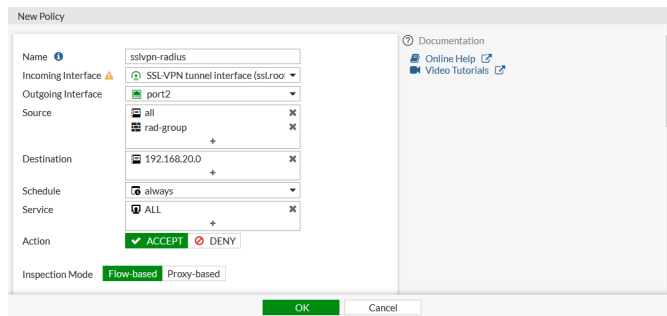

OK Cancel

- Click *OK*.
- Click *Apply*.

To configure an SSL VPN firewall policy:

- Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- Set the policy name, in this example, *sslvpn-radius*.
- Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
- Set *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port2*.
- Set the *Source > Address* to *all* and *Source > User* to *rad-group*.
- Set *Destination > Address* to the internal protected subnet *192.168.20.0*.
- Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.

8. Enable NAT.

9. Configure the remaining options as required.

10. Click OK.

Configure SSL-VPN with RADIUS on Windows NPS in the CLI

To configure SSL VPN using the CLI:

1. Configure the internal and external interfaces:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.2.5 255.255.255.0
        set alias internal
    next
    edit "port2"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias external
    next
end
```

2. Configure the firewall address:

```
config firewall address
    edit "192.168.20.0"
        set subnet 192.168.20.0 255.255.255.0
    next
end
```

3. Add the RADIUS server:

```
config user radius
    edit "rad-server"
        set server "192.168.20.6"
        set secret *****
    next
end
```

4. Create a user group and add the RADIUS server to it:.

```
config user group
    edit "rad-group"
        set member "rad-server"
    next
end
```

5. Configure SSL VPN settings:

```

config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "rad-group"
            set portal "full-access"
        next
    end
end

```

6. Configure an SSL VPN firewall policy to allow remote user to access the internal network.

```

config firewall policy
    edit 1
        set name "sslvpn-radius"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups "rad-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

Results**To connect with FortiClient in tunnel mode:**

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to *192.168.2.5*.
 - c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the RADIUS user credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User      Group   Auth Type   Timeout      From      HTTP in/out   HTTPS in/out

SSL VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

A tertiary server can be configured in the CLI.

Sample topology**Sample configurations**

- [Configure a Primary and Secondary server for backup on page 2134](#)
- [Authenticating to two RADIUS servers concurrently on page 2138](#)

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.

In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.

3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To add the RADIUS servers:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *PrimarySecondary*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Under *Secondary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
7. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
8. Click *OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *PrimarySecondaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *PrimarySecondary*.
4. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
 - a. Select *All Other Users/Groups* and click *Edit*.
 - b. From the *Portal* dropdown, select *web-access*.
 - c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
 - a. Under *Authentication/Portal Mapping*, click *Create New*.
 - b. Click *Users/Groups* and select *PrimarySecondaryGroup*.
 - c. From the *Portal* dropdown, select *full-access*.
 - d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it and configure the following settings:

Name	Enter a name for the policy.
Incoming Interface	<i>SSL-VPN tunnel interface (ssl.root)</i>
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select <i>port3</i> .
Source	In the <i>Address</i> tab, select <i>SSLVPN_TUNNEL_ADDR1</i> In the <i>User</i> tab, select <i>PrimarySecondaryGroup</i>
Destination	Select the internal protected subnet <i>192.168.20.0</i> .
Schedule	<i>always</i>
Service	<i>All</i>
Action	<i>Accept</i>
NAT	<i>Enable</i>

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```

config system interface
    edit "port3"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias "internal"
    next
end
config firewall address
    edit "192.168.20.0"
        set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
        set subnet 192.168.20.0 255.255.255.0
    next
end

```

2. Configure the RADIUS server:

```

config user radius
    edit "PrimarySecondary"
        set server "192.168.20.6"
        set secret <secret>
        set secondary-server "192.168.2.71"
        set secondary-secret <secret>
    next
end

```

3. Add the RADIUS user to the user group:

```

config user group

```

```

edit "PrimarySecondaryGroup"
    set member "PrimarySecondary "
next
end
4. Configure SSL VPN settings:
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "PrimarySecondaryGroup "
            set portal "full-access"
        next
    end
end

```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```

config firewall policy
    edit 1
        set name "sslvpn-radius"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups "PrimarySecondaryGroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To verify the connection:

User *radkeith* is a member of both the NPS server and the FAC server.

When the Primary server is up, it will connect to the SSL VPN tunnel using FortiClient.

```

# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 16:26:50.838453 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 118
2020-05-15 16:26:50.883166 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 20
2020-05-15 16:26:50.883374 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 182
2020-05-15 16:26:50.884683 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 228

```

The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```

# get vpn ssl monitor
SSL VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	From	HTTP
in/out	HTTPS in/out					
0	radkeith	PrimarySecondaryGroup	2(1)	285	192.168.2.202	
0/0	0/0					

SSL VPN sessions:

Index	User	Group	Source IP	Duration	I/O Bytes
Tunnel/Dest IP					
0	radkeith	PrimarySecondaryGroup	192.168.2.202	62	132477/4966
10.212.134.200					

When the Primary server is down, and the Secondary server is up, the connection is made to the SSLVPN tunnel again:

```
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 16:31:23.016875 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:28.019470 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:30.011874 port1 out 192.168.2.5.23848 -> 192.168.2.71.1812: udp 118
2020-05-15 16:31:30.087564 port1 in 192.168.2.71.1812 -> 192.168.2.5.23848: udp 20
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The VPN connection is established.

```
# get vpn ssl monitor
```

SSL VPN Login Users:

Index	User	Group	Auth Type	Timeout	From	HTTP
in/out	HTTPS in/out					
0	radkeith	PrimarySecondaryGroup	2(1)	287	192.168.2.202	
0/0	0/0					

SSL VPN sessions:

Index	User	Group	Source IP	Duration	I/O Bytes
Tunnel/Dest IP					
0	radkeith	PrimarySecondaryGroup	192.168.2.202	48	53544/4966
10.212.134.200					

Authenticating to two RADIUS servers concurrently

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*

4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To configure the first RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *win2k16*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Click *OK*.

To configure the second RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *fac*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Click *OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *dualPrimaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *fac*.
4. Click *Add* again. From the *Remote Server* dropdown select *win2k16* and click *OK*.
5. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
 - a. Select *All Other Users/Groups* and click *Edit*.
 - b. From the *Portal* dropdown, select *web-access*.
 - c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
 - a. Under *Authentication/Portal Mapping*, click *Create New*.
 - b. Click *Users/Groups* and select *dualPrimaryGroup*.
 - c. From the *Portal* dropdown, select *full-access*.
 - d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it.

Name	Enter a name for the policy.
Incoming Interface	<i>SSL-VPN tunnel interface (ssl.root)</i>
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select <i>port3</i> .
Source	In the <i>Address</i> tab, select <i>SSLVPN_TUNNEL_ADDR1</i> In the <i>User</i> tab, select <i>dualPrimaryGroup</i>
Destination	Select the internal protected subnet <i>192.168.20.0</i> .
Schedule	<i>always</i>
Service	<i>All</i>
Action	<i>Accept</i>
NAT	<i>Enable</i>

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
  edit "port3"
    set vdom "root"
    set ip 192.168.20.5 255.255.255.0
    set alias "internal"
  next
end
config firewall address
  edit "192.168.20.0"
    set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
    set subnet 192.168.20.0 255.255.255.0
  next
end
```

2. Configure the RADIUS server:

```
config user radius
  edit "win2kl6"
    set server "192.168.20.6"
    set secret <secret>
  next
  edit "fac"
    set server "192.168.2.71"
    set secret <secret>
  next
end
```

3. Add the RADIUS user to the user group:

```
config user group
  edit "dualPrimaryGroup"
    set member "win2k16" "fac"
  next
end
```

4. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "port1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "dualPrimaryGroup"
      set portal "full-access"
    next
  end
end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn-radius"
    set srcintf "ssl.root"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "192.168.20.0"
    set groups "dualPrimaryGroup"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

To verify the connection:

User *fackeith* is a member of the FortiAuthenticator server only.

User *radkeith* is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.

Case 1: Connect to the SSLVPN tunnel using FortiClient with user FacAdmin:

```
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 17:21:31.217985 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 118
2020-05-15 17:21:31.218091 port1 out 192.168.2.5.11490 -> 192.168.2.71.1812: udp 118
2020-05-15 17:21:31.219314 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20 <--
access-reject
2020-05-15 17:21:31.219519 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 182
2020-05-15 17:21:31.220219 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 42
2020-05-15 17:21:31.220325 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 119
2020-05-15 17:21:31.220801 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20
```

```
2020-05-15 17:21:31.236009 port1 in 192.168.2.71.1812 -> 192.168.2.5.11490: udp 20 <--
access-accept
```

Access is denied by the NPS server because the user does not exist. However, access is accepted by FortiAuthenticator. The end result is the authentication is successful.

```
# get vpn ssl monitor
```

```
SSL VPN Login Users:
```

Index in/out	User HTTPS	Group in/out	Auth Type	Timeout	From	HTTP
0 0/0	fackeith	dualPrimaryGroup	2(1)	292	192.168.2.202	0/0

```
SSL VPN sessions:
```

Index Tunnel/Dest IP	User	Group	Source IP	Duration	I/O Bytes
0 10.212.134.200	fackeith	dualPrimaryGroup	192.168.2.202	149	70236/4966

Case 2: Connect to the SSLVPN tunnel using FortiClient with user radkeith:

```
# diagnose sniffer packet any 'port 1812' 4 0 1
```

```
interfaces=[any]
```

```
filters=[port 1812]
```

```
2020-05-15 17:26:07.335791 port1 out 192.168.2.5.17988 -> 192.168.2.71.1812: udp 118
2020-05-15 17:26:07.335911 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 118
2020-05-15 17:26:07.337659 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 20 <--
access-accept
2020-05-15 17:26:07.337914 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 182
2020-05-15 17:26:07.339451 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 228
2020-05-15 17:26:08.352597 port1 in 192.168.2.71.1812 -> 192.168.2.5.17988: udp 20 <--
access-reject
```

There is a password mismatch for this user on the Secondary RADIUS server. However, even though the authentication was rejected by FortiAuthenticator, it was accepted by Windows NPS. Therefore, the end result is authentication successful.

```
# get vpn ssl monitor
```

```
SSL VPN Login Users:
```

Index in/out	User HTTPS	Group in/out	Auth Type	Timeout	From	HTTP
0 0/0	radkeith	dualPrimaryGroup	2(1)	290	192.168.2.202	0/0

```
SSL VPN sessions:
```

Index Tunnel/Dest IP	User	Group	Source IP	Duration	I/O Bytes
0 10.212.134.200	radkeith	dualPrimaryGroup	192.168.2.202	142	64875/4966

SSL VPN with local user password policy

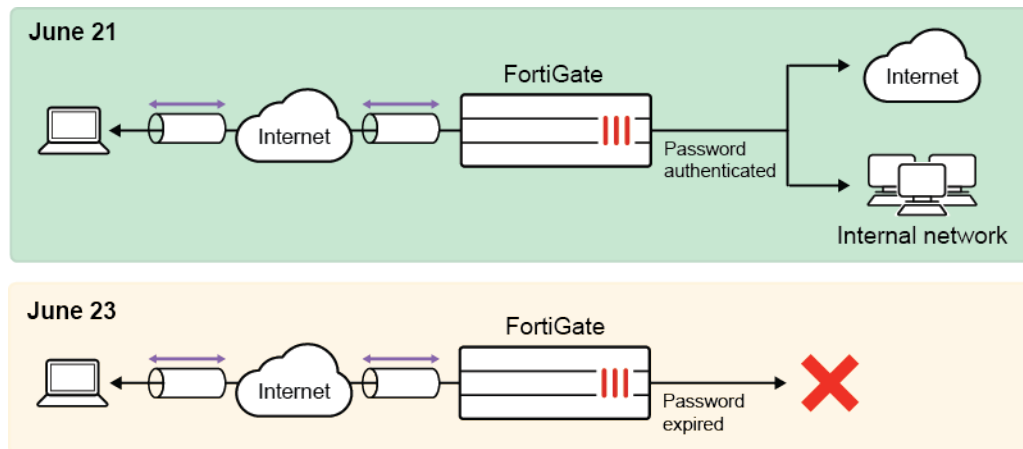

This is a sample configuration of SSL VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user password. The password

policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user.
 - b. Go to *User & Authentication > User Groups* to create a user group and add that local user to it.
3. Configure and assign the password policy using the CLI.
 - a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
  edit "pwpolicy1"
    set expire-days 2
    set warn-days 1
  next
end
```

- b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

4. Configure SSL VPN web portal.

- a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
- b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.

5. Configure SSL VPN settings.

- a. Go to *VPN > SSL-VPN Settings*.
- b. Select the *Listen on Interface(s)*, in this example, *wan1*.
- c. Set *Listen on Port* to *10443*.
- d. Set *Server Certificate* to the authentication certificate.
- e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
- f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.

6. Configure SSL VPN firewall policy.

- a. Go to *Policy & Objects > Firewall Policy*.
- b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
- c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
- d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
- e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
- f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
- g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
- h. Enable *NAT*.
- i. Configure any remaining firewall and security options as desired.
- j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure user and user group.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd your-password
  next
end
config user group
  edit "sslvpngroup"
    set member "vpnuser1"
  next
end
```

4. Configure and assign the password policy.

- a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
  edit "pwpolicy1"
    set expire-days 2
    set warn-days 1
  next
end
```

- b. Assign the password policy to the user you just created.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd-policy "pwpolicy1"
  next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
```

```

config authentication-rule
    edit 1
        set groups "sslvpngroup"
        set portal "full-access"
    next
end
end

```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *sslvpnuser1* credentials.
When the warning time is reached, the user is prompted to enter a new password.
In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.
In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set the connection name.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials.
When the warning time is reached, the user is prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check that login failed due to password expired on GUI:

1. Go to *Log & Report > System Events* and select the *VPN Events* card to see the SSL VPN alert labeled `ssl-login-fail`.
2. Click *Details* to see the log details about the *Reason* `sslvpn_login_password_expired`.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1(1)	229	10.1.100.254	0/0	0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
-------	------	-----------	----------	-----------	----------------

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1(1)	291	10.1.100.254	0/0	0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

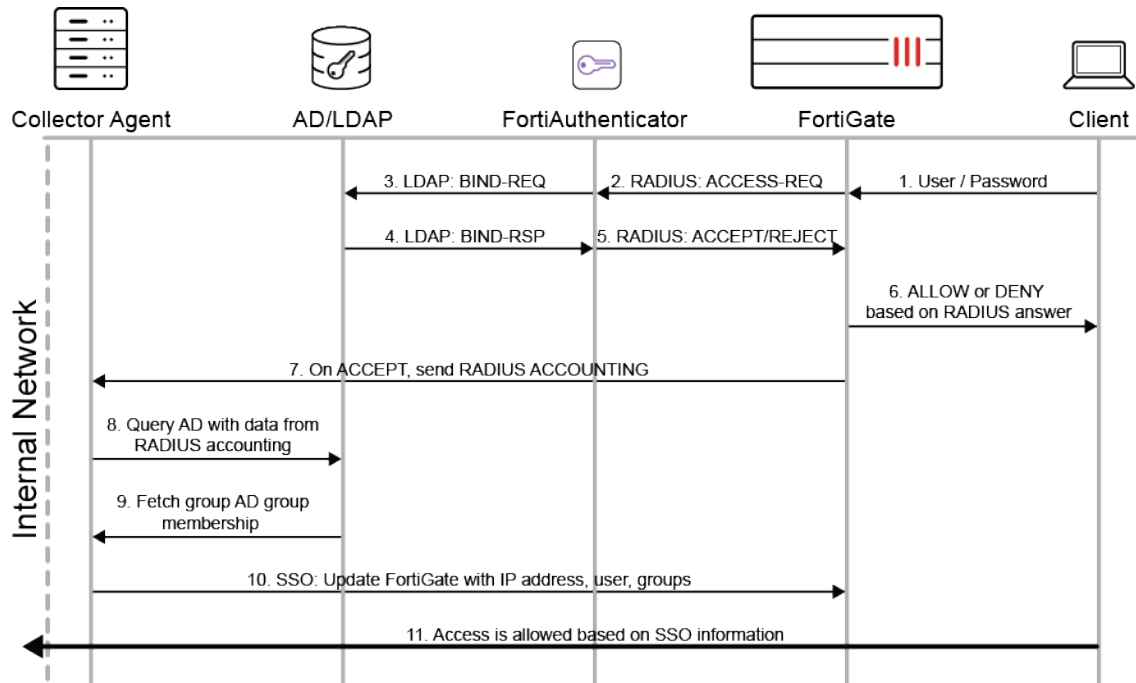

To check the FortiOS 6.2 login password expired event log:

```
FG201E4Q17901354 # execute log filter category event
FG201E4Q17901354 # execute log filter field subtype vpn
FG201E4Q17901354 # execute log filter field action ssl-login-fail
FG201E4Q17901354 # execute log display
1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert"
vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail"
tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A"
reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"
```

Dynamic address support for SSL VPN policies

Dynamic SSO user groups can be used in place of address objects when configuring SSL VPN policies. This allows dynamic IP addresses to be used in SSL VPN policies. A remote user group can be used for authentication while an FSSO group is separately used for authorization. Using a dummy policy for remote user authentication and a policy for FSSO group authorization, FSSO can be used with SSL VPN tunnels.

This image shows the authentication and authorization flow:

In this example, FortiAuthenticator is used as a RADIUS server. It uses a remote AD/LDAP server for authentication, then returns the authentication results to the FortiGate. This allows the client to have a dynamic IP address after successful authentication.

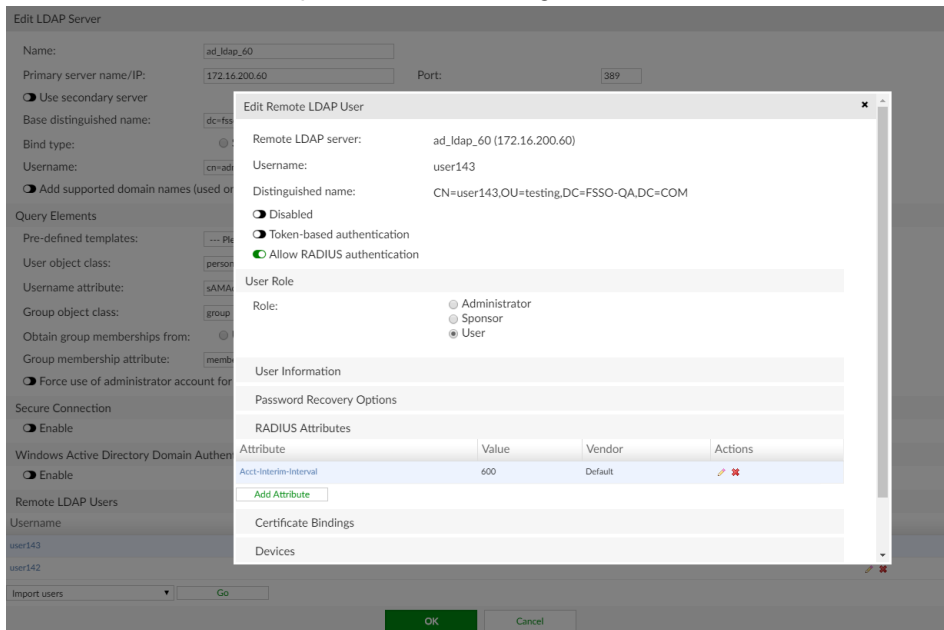

First, on the LDAP server, create two users each in their own group, *user142* in group *pc_group1*, and *user143* in group *pc_group2*.

Configure the FortiAuthenticator

To add a remote LDAP server and users on the FortiAuthenticator:

1. Go to *Authentication > Remote Auth. Servers > LDAP*.
2. Click *Create New*.
3. Set the following:
 - *Name*: *ad_ldap_60*
 - *Primary server name/IP*: *172.16.200.60*
 - *Base distinguished name*: *dc=fsso-qa,dc=com*
 - *Bind type*: *Regular*
 - *Username*: *cn=administrator,cn=User*
 - *Password*: <enter a password>
4. Click *OK*.
5. Edit the new LDAP server.
6. Import the remote LDAP users.
7. Edit each user to confirm that they have the RADIUS attribute *Acct-Interim-Interval*. This attribute is used by FortiGate to send interim update account messages to the RADIUS server.

To create a RADIUS client for FortiGate as a remote authentication server:

1. Go to *Authentication > RADIUS Service > Clients*.
2. Click *Create New*.
3. Set the following:
 - *Name*: *fsso_ldap*
 - *Client address*: *Range 172.16.200.1~172.16.200.10*
 - *Secret*: <enter a password>
4. In the *Realms* table, set the realm to the LDAP server that was just added: *ad_ldap_60*.

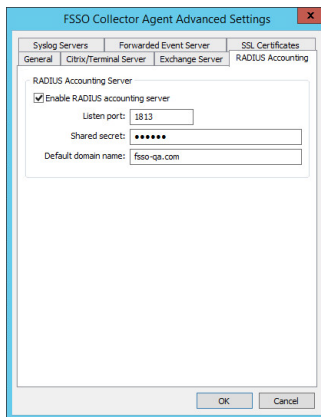

5. Click **OK**.

FortiAuthenticator can now be used as a RADIUS server, and the authentication credentials all come from the DC/LDAP server.

Fortinet Single Sign-On Collector Agent

To configure the Fortinet Single Sign-On Collector Agent:

1. Select *Require authenticated connection from FortiGate* and enter a *Password*.
2. Click *Advanced Settings*.
3. Select the *RADIUS Accounting* tab.
4. Select *Enable RADIUS accounting server* and set the *Shared secret*.

5. Click **OK**, then click **Save & close**.

The collector agent can now accept accounting requests from FortiGate, and retrieve the IP addresses and usernames of SSL VPN client from the FortiGate with accounting request messages.

Configure the FortiGate

To configure the FortiGate in the CLI:

1. Create a Fortinet Single Sign-On Agent fabric connector:

```
config user fsso
  edit "AD_CollectAgent"
    set server "172.16.200.60"
    set password 123456
  next
end
```

2. Add the RADIUS server:

```
config user radius
  edit "rad150"
    set server "172.16.200.150"
    set secret 123456
    set acct-interim-interval 600
    config accounting-server
      edit 1
        set status enable
        set server "172.16.200.60"
```

```
        set secret 123456
    next
end
next
end
```

3. Create a user group for the RADIUS server:

```
config user group
    edit "rad_group"
        set member "rad150"
    next
end
```

4. Create user groups for each of the FSSO groups:

```
config user group
    edit "fsso_group1"
        set group-type fsso-service
        set member "CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
    edit "fsso_group2"
        set group-type fsso-service
        set member "CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
end
```

5. Create an SSL VPN portal and assign the RADIUS user group to it:

```
config vpn ssl web portal
    edit "testportal"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        ...
    next
end
config vpn ssl settings
    ...
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "rad_group"
            set portal "testportal"
        next
    end
end
```

6. Create firewall addresses:

```
config firewall address
    edit "none"
        set subnet 0.0.0.0 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
```

```
    next
end
```

7. Create one dummy policy for authentication only, and two normal policies for authorization:

```
config firewall policy
    edit 1
        set name "sslvpn_authentication"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "none"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "rad_group"
        set nat enable
    next
    edit 3
        set name "sslvpn_authorization1"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc4"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group1"
        set nat enable
    next
    edit 4
        set name "sslvpn_authorization2"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc5"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group2"
        set nat enable
    next
end
```

To create an FSSO agent fabric connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Click *FSSO Agent on Windows AD*.

4. Enter the name and *Primary FSSO agent* information.

5. Click *Apply & Refresh*.

The FSSO groups are retrieved from the collector agent.

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers*.
2. Click *Create New*.
3. Enter a name for the server.
4. Enter the *IP/Name* and *Secret* for the primary server.
5. Click *Test Connectivity* to ensure that there is a successful connection.

6. Click *OK*.

7. Configure an accounting server with the following CLI command:

```
config user radius
  edit rad150
    set acct-interim-interval 600
    config accounting-server
      edit 1
        set status enable
        set server 172.16.200.60
        set secret *****
      next
    end
  next
end
```

To create a user group for the RADIUS server in the GUI:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Firewall*.
4. Add the RADIUS server as a remote group.

The screenshot shows the 'New User Group' configuration window in the FortiGate GUI. The 'Name' field is populated with 'rad_group'. The 'Type' dropdown menu is open, showing options: 'Firewall' (selected), 'Fortinet Single Sign-On (FSSO)', 'RADIUS Single Sign-On (RSSO)', and 'Guest'. Below the dropdown is a 'Members' field with a '+' icon. The 'Remote Groups' section contains a table with columns 'Remote Server' and 'Group Name'. One entry is visible: 'rad150'. To the right of the main form is a sidebar with links for 'FortiGate', 'FGDocs', 'API Preview', 'Documentation', 'Online Help', and 'Video Tutorials'. At the bottom of the dialog are 'OK' and 'Cancel' buttons.

5. Click *OK*.

To create user groups for each of the FSSO groups in the GUI:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Add PC_GROUP1 as a member:
CN=PC_GROUP1, OU=TESTING, DC=FSSO-QA, DC=COM
5. Click *OK*.
6. Add a second user group with PC_GROUP2 as a member:
CN=PC_GROUP1, OU=TESTING, DC=FSSO-QA, DC=COM
7. Click *OK*.

To create an SSL VPN portal and assign the RADIUS user group to it in the GUI:

1. Go to *VPN > SSL VPN Portals*.
2. Click *Create New*.
3. Configure the portal, then click *OK*.
4. Go to *VPN > SSL VPN Settings*.
5. Configure the required settings.
6. Create an *Authentication/Portal Mapping* table entry:
 - a. Click *Create New*.
 - b. Set *User/Groups* to *rad_group*.
 - c. Set *Portal* to *testportal*.
 - d. Click *OK*.
7. Click *OK*.

To create policies for authentication and authorization in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Configure a dummy policy for authentication. Set the destination to *none* so that traffic is not allowed through the FortiGate, and add *rad_group* as a source.
3. Configure two authorization policies, with the FSSO groups as sources.

Confirmation

On *Client 1*, log in to FortiClient using *user142*. Traffic can go to *pc4* (172.16.200.44), but cannot go to *pc5* (172.16.200.55).

On *Client 2*, log in to FortiClient using *user143*. Traffic can go to *pc5* (172.16.200.55), but cannot go to *pc4* (172.16.200.44).

On the FortiGate, check the authenticated users list and the SSL VPN status:

```
# diagnose firewall auth list

10.212.134.200, USER142
    type: fsso, id: 0, duration: 173, idled: 173
    server: AD_CollectAgent
    packets: in 0 out 0, bytes: in 0 out 0
    user_id: 16777229
    group_id: 3 33554434
    group_name: fsso_group1 CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM

10.212.134.200, user142
    type: fw, id: 0, duration: 174, idled: 174
    expire: 259026, allow-idle: 259200
    flag(80): sslvpn
    server: rad150
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 4
    group_name: rad_group

10.212.134.201, USER143
    type: fsso, id: 0, duration: 78, idled: 78
    server: AD_CollectAgent
```

```

packets: in 0 out 0, bytes: in 0 out 0
group_id: 1 33554435
group_name: fsso_group2 CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM

```

```

10.212.134.201, user143
type: fw, id: 0, duration: 79, idled: 79
expire: 259121, allow-idle: 259200
flag(80): sslvpn
server: rad150
packets: in 0 out 0, bytes: in 0 out 0
group_id: 4
group_name: rad_group

```

```

----- 4 listed, 0 filtered -----

```

```

# get vpn ssl monitor

```

```

SSL VPN Login Users:

```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	user142	2 (1)	600	10.1.100.145	0/0	0/0
1	user143	2 (1)	592	10.1.100.254	0/0	0/0

```

SSL VPN sessions:

```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	user142	10.1.100.145	104	32190/16480	10.212.134.200
1	user143	10.1.100.254	11	4007/4966	10.212.134.201

SSL VPN multi-realm

This sample shows how to create a multi-realm SSL VPN that provides different portals for different user groups.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click OK.
 - e. Go to *Policy & Objects > Address* and create an address for internet *QA_subnet* with subnet *192.168.1.0/24* and *HR_subnet* with subnet *10.1.100.0/24*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create local users *qa-user1* and *hr-user1*.
 - b. Go to *User & Authentication > User Groups* to create separate user groups for web-only and full-access portals:
 - *QA_group* with member *qa-user1*.
 - *HR_group* with the member *hr-user1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create portal *qa-tunnel*.
 - b. Enable *Tunnel Mode*.
 - c. Create a portal *hr-web* with *Web Mode* enabled.
4. Configure SSL VPN realms.
 - a. Go to *System > Feature Visibility* to enable *SSL-VPN Realms*.
 - b. Go to *VPN > SSL-VPN Realms* to create realms for *qa* and *hr*.
 - c. (Optional) To access each realm with FQDN instead of the default URLs *https://172.20.120.123:10443/hr* and *https://172.20.120.123:10443/qa*, you can configure a virtual-host for the realm in the CLI.

```
config vpn ssl web realm
  edit hr
    set virtual-host hr.mydomain.com
  next
  edit qa
    set virtual-host qa.mydomain.com
  next
end
```

Where *mydomain.com* is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.

5. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.

- e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
- f. Create new *Authentication/Portal Mapping* for group *QA_group* mapping portal *qa-tunnel*.
- g. Specify the realm *qa*.
- h. Add another entry for group *HR_group* mapping portal *hr-web*.
- i. Specify the realm *hr*.
- 6. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Create a firewall policy for QA access.
 - c. Fill in the firewall policy name. In this example, *QA sslvpn tunnel mode access*.
 - d. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - e. Choose an *Outgoing Interface*. In this example, *port1*.
 - f. Set the *Source* to *all* and group to *QA_group*.
 - g. In this example, the *Destination* is the internal protected subnet *QA_subnet*.
 - h. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - i. Click OK.
 - j. Create a firewall policy for HR access.
 - k. Fill in the firewall policy name. In this example, *HR sslvpn web mode access*.
 - l. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - m. Choose an *Outgoing Interface*. In this example, *port1*.
 - n. Set the *Source* to *all* and group to *HR_group*.
 - o. In this example, the *Destination* is the internal protected subnet *HR_subnet*.
 - p. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - q. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "QA_subnet"
    set subnet 192.168.1.0 255.255.255.0
  next
  edit "HR_subnet"
    set subnet 10.1.100.0 255.255.255.0
```

```
    next
end
```

3. Configure user and user group.

```
config user local
    edit "qa_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "QA_group"
        set member "qa_user1"
    next
end

config user local
    edit "hr_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "HR_group"
        set member "hr_user1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "qa-tunnel"
        set tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set split-tunneling-routing-address "QA_subnet"
    next
end

config vpn ssl web portal
    edit "hr-web"
        set web-mode enable
    next
end
```

5. Configure SSL VPN realms.

```
config vpn ssl web realm
    edit hr
        set virtual-host hr.mydomain.com
    next
    edit qa
        set virtual-host qa.mydomain.com
    next
end
```

The `set virtual-host` setting is optional. For example:

```
config vpn ssl web realm
    edit hr
    next
```

```
edit qa
next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "QA_group"
            set portal "qa-tunnel"
            set realm qa
        next
        edit 2
            set groups "HR_group"
            set portal "hr-web"
            set realm hr
        next
    end
end
```

7. Configure two SSL VPN firewall policies to allow remote QA user to access internal QA network and HR user to access HR network.

```
config firewall policy
    edit 1
        set name "QA sslvpn tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "QA_subnet"
        set groups "QA_group"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "HR sslvpn web access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "HR_subnet"
        set groups "HR_group"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To see the results for QA user:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection.
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to *https://172.20.120.123:10443/qa.*
 - If a virtual-host is specified, use the FQDN defined for the realm (*qa.mydomain.com*).
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to subnet *192.168.1.0* goes through the tunnel.
8. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
9. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
10. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details of the traffic.

To see the results for HR user:

1. In a web browser, log into the portal *https://172.20.120.123:10443/hr* using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (*hr.mydomain.com*).
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* and view the details of the traffic.

NAS-IP support per SSL-VPN realm

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.

In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.

To configure the SSL-VPN to use the NAS-IP in the realm settings:

1. Configure a RADIUS user and add it to a group:

```
config user radius
    edit "fac150"
        set server "172.16.200.150"
        set secret *****
        set nas-ip 172.16.200.2
    config accounting-server
        edit 1
            set status enable
            set server "172.16.200.150"
            set secret *****
        next
    end
next
end
config user group
    edit "radgrp"
        set member "fac150"
    next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
    edit "realm1"
        set login-page '.....'
        set radius-server "fac150"
        set nas-ip 10.1.100.2
    next
end
```

3. Configure SSL-VPN with an authentication rule that includes the user group and the realm:

```
config vpn ssl settings
    ...
    config authentication-rule
        edit 1
            set groupd "radgrp"
            set portal "testportal1"
            set realm "realm1"
        next
    end
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn1"
        ...
        set srcintf "ssl.vdom1"
        set groups "radgrp"
    next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.

port1.vdom1.1 (52).pcap

SSL VPN with Okta as SAML IdP

In this configuration, the FortiGate acts as a SAML service provider (SP) requesting authentication from Okta, which acts as a SAML identity provider (IdP). The following shows the topology in this configuration:

The authentication process is as follows in this deployment:

1. The user initiates an SSL VPN request to the FortiGate.
2. The FortiGate sends the browser POST redirect to FortiClient.
3. FortiClient redirects the SAML authentication request to Okta.
4. The user authenticates with Okta using their credentials.
5. Okta sends a SAML assertion that contains the user and group authentication in a POST redirect to the SSL VPN login page.
6. FortiClient sends the redirected Okta request that contains the SAML assertion to the FortiGate.
7. The FortiGate consumes the assertion and provides the user with access to resources based on the defined firewall security policy.

The example assumes that you already have an Okta account. This example uses users locally defined within the Okta directory and does not include LDAP mapping. The instructions describe the steps that you take if using the free Okta developer edition.

To configure Okta for SSL VPN with FortiOS:

1. Log in to the Okta portal as the registered admin user.
2. Add the FortiGate application:
 - a. Go to *Applications*.
 - b. Click *Applications*, then click *Create App Integration*.
 - c. Click *SAML 2.0*, then *Next*.
 - d. Configure SAML settings:
 - i. Proceed through the application creation wizard. In the *Single sign on URL* field, enter `https://<FortiGate IP address>:<port>/remote/saml/login/`. In this example, it is `https://10.0.3.254:10443/remote/saml/login/`.
 - ii. Enable *Use this for Recipient URL and Destination URL*.
 - iii. In the *Audience URI (SP Entity ID)* field, enter the `https://<FortiGate IP address>:<port>/remote/saml/metadata/`. In this example, it is `https://10.0.3.254:10443/remote/saml/metadata/`.
 - iv. Click *Download Okta Certificate* to download the Okta certificate to your machine. You will provide this certificate to the FortiGate.
 - v. Click *Show Advanced Settings*. From the *Response* dropdown list, select *Signed*.
 - vi. From the *Assertion Signature* dropdown list, select *Signed*.
 - vii. In the *Single Logout URL* field, enter `https://<FortiGate IP address>:<port>/remote/saml/logout/`. In this example, it is `https://10.0.3.254:10443/remote/saml/logout/`.
 - viii. In the *SP Issuer* field, enter `https://<FortiGate IP address>:<port>/remote/saml/metadata/`. In this example, it is `https://10.0.3.254:10443/remote/saml/metadata/`.
 - ix. In the *Signature Certificate* field, first download the Fortinet_Factory certificate by logging into FortiOS, going to *System > Local Certificate*, then browsing to and uploading the FortiGate certificate. Okta uses this to authenticate the SAML SP.

Hide Advanced Settings

Response	Signed
Assertion Signature	Signed
Signature Algorithm	RSA-SHA256
Digest Algorithm	SHA256
Assertion Encryption	Unencrypted
Enable Single Logout	<input checked="" type="checkbox"/> Allow application to initiate Single Logout
Single Logout URL	https://10.0.3.254:10443/remote/saml/logout/
SP Issuer	https://10.0.3.254:10443/remote/saml/metadata/
Signature Certificate	Fortinet_Factory.cer Browse
	Upload Certificate
Assertion Inline Hook	None (disabled)
Authentication context class	PasswordProtectedTransport
Honor Force Authentication	Yes
SAML Issuer ID	http://www.okta.com/\${org.externalKey}

- e. Under *ATTRIBUTE STATEMENTS* and *GROUP ATTRIBUTE STATEMENTS*, define attribute mappings for Okta to use in SAML assertion. In this example, the following is entered as a attribute statement and a group attribute statement, respectively:

- username, with value user.login
- group, with *Matches regex* filter

The screenshot shows two sections in the Okta configuration interface:

- ATTRIBUTE STATEMENTS (OPTIONAL)**: This section contains a table with columns for Name, Name format (optional), and Value. The 'Name' field is set to 'username', 'Name format' is set to 'Basic', and 'Value' is set to 'user.login'. A red box highlights the 'username' field.
- GROUP ATTRIBUTE STATEMENTS (OPTIONAL)**: This section contains a table with columns for Name, Name format (optional), and Filter. The 'Name' field is set to 'group', 'Name format' is set to 'Basic', and 'Filter' is set to 'Matches regex'. A red box highlights the 'group' field and the 'Matches regex' filter.

- f. On the *Feedback* step, select *I'm an Okta customer adding an internal app*.
- g. Select *This is an internal app that we have created*.
- h. Click *Finish*.
3. Go to *Directory > People*.
4. Click *Add Person*.
5. Enter the person's details as desired. Click *Save*.

The screenshot shows the 'Add Person' form in the Okta interface. The form includes the following fields:

- User type**: A dropdown menu set to 'User'.
- First name**: A text input field containing 'Tom'.
- Last name**: A text input field containing 'Smith'.
- Username**: A text input field containing 'tsmith@fortiad.info'.
- Primary email**: A text input field containing 'tsmith@fortiad.info'.
- Secondary email (optional)**: An empty text input field.
- Groups (optional)**: An empty text input field.
- Password**: A dropdown menu set to 'Set by admin' and a password input field with masked characters.
- User must change password on first login**: An unchecked checkbox.

A red box highlights the 'First name', 'Last name', 'Username', and 'Primary email' fields. At the bottom of the form, there are three buttons: 'Save', 'Save and Add Another', and 'Cancel'.

6. Add a group:
- Go to *Directory > Groups*.
 - Click *Add Group*.
 - Enter the desired name, then click *Add Group*. In this example, the name is corporate-saml.

- d. Select the newly added group, then click *Assign People*.
- e. Add the person that you created as a member of the new group. Click *Save*.
7. Assign the group to the FortiGate application:
 - a. Go to *Applications > FortiGate application > Assignments*.
 - b. From the *Assign* dropdown list, select *Assign to Groups*.
 - c. Assign the group that you created to the FortiGate application.
8. To view the SAML setup instructions, do the following:
 - a. Click the newly created application's name.
 - b. Click *Sign On*.
 - c. Go to *View SAML Setup Instructions*. Note down the *Identity Provider Single Sign-On URL*, *Identity Provider Single Logout URL*, and *Identity Provider Issuer* values.
9. Download the Okta certificate and upload it to FortiOS:
 - a. From *View SAML Setup Instructions*, download the certificate.
 - b. In FortiOS, go to *System > Certificates*.
 - c. From the *Create/Import* dropdown list, select *Remote Certificate*.
 - d. Click *Upload* and upload the downloaded Okta certificate.

To configure the FortiGate:

1. Configure the FortiGate SP to be a SAML user:

```
config user saml
  edit "okta-idp"
    set cert "Fortinet_Factory"
    set entity-id "https://10.0.3.254:10443/remote/saml/metadata/"
    set single-sign-on-url "https://10.0.3.254:10443/remote/saml/login"
    set single-logout-url "https://10.0.3.254:10443/remote/saml/logout"
    set idp-entity-id "http://www.okta.com/exk103foxaa8gk5qy4x7"
    set idp-single-sign-on-url "https://fortinet01.okta.com/app/fortinetorg878484_
      fortigate_1/exk103foxaa8gk5qy4x7/sso/saml"
    set idp-single-logout-url "https://fortinet01.okta.com/app/fortinetorg878484_
      fortigate_1/exk103foxaa8gk5qy4x7/slo/saml"
    set idp-cert "Okta-IDP_Certificate"
    set user-name "username"
    set group-name "group"
  next
end
```

2. Configure user group assertion on Okta as part of the SAML assertion attributes. It is important that the group attribute value received is locally matched with the `group-name` value:

```
config user group
  edit "corporate-saml"
    set member "okta-idp"
    config match
      edit 1
        set server-name "okta-idp"
        set group-name "corporate-saml"
      next
    end
  next
end
```

3. Go to *VPN > SSL-VPN Settings*. Configure VPN settings as desired. When testing the VPN solution, starting with a web-based configuration, then moving to a tunnel-based configuration is recommended. Web-based testing can help in troubleshooting.

Authentication/Portal Mapping ⓘ

[+ Create New](#) [Edit](#) [Delete](#) [Send SSL-VPN Configuration](#)

Users/Groups	Realm	Portal
corporate-saml	/	full-access
sslvpn_group	/	full-access
All Other Users/Groups	/	full-access

4. Configure a local or RADIUS user as a backup. This setting also provides a login web user with a choice of local or SSO login.

5. Go to *Policy and Objects > Firewall Policies*. Configure a policy as desired.

6. Increase the global authentication timeout period to allow users to fill in their credentials in time. The default timeout is five seconds:

```
config system global
    set remoteauthtimeout 60
end
```

To configure EMS:

1. In EMS, go to *Endpoint Profiles > Manage Profiles*. Edit a VPN profile.

2. Under *VPN Tunnels*, click *Add Tunnel*.

3. In the *Remote Gateway* field, enter the FortiGate IP address. In this example, it is 10.0.3.254.

4. In the *Port* field, enter the port number. In this example, it is 10443.

Creating VPN Tunnel

Changes to this VPN tunnel will not be saved until the profile is saved.

Basic Settings

Split Tunnel

Application Based

On Disconnect Script

Name

okta-saml

Cannot contain the characters \/*<>.

Type

SSL VPN IPsec VPN

Remote Gateway

10.0.3.254

Port

10443

☐ Require Certificate

☒ Prompt for Username

Add Tunnel Cancel

5. In *Advanced Settings*, enable *Enable SAML Login*.

6. Click *Add Tunnel*.

7. Save the profile.

8. After the policy synchronizes to the endpoint, the *SAML Login* button is visible on the Remote Access tab in FortiClient.

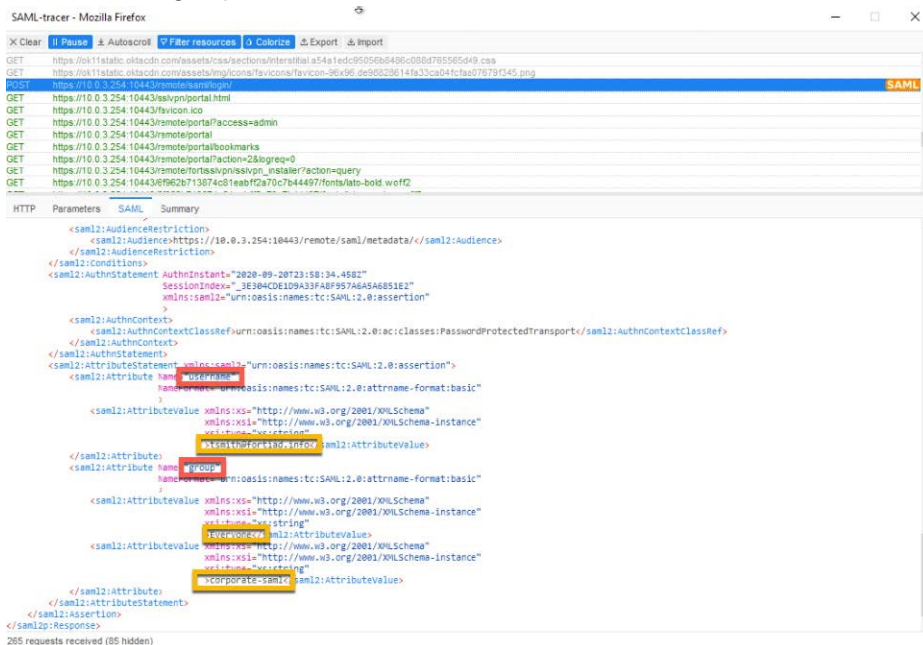

To test the configuration:

1. You will first test web-based SSL VPN authentication using Firefox with the SAML tracer plugin enabled. Install the [SAML-tracer plugin](#) to Firefox.

2. In Firefox, go to the FortiOS SSL VPN login page. In this example, this is <https://10.0.3.254:10443>.

3. Open the SAML tracer.

- The browser redirects to the Okta SAML login page. Enter the Okta credentials, then click *Sign in*.
- Upon successful authentication, the browser redirects to the authenticated SSL VPN page. If authentication does not succeed, review the SAML tracer to confirm the SAML assertion attributes that are passed during the authentication session. Select the POST message with the SAML information. On the SAML tab, confirm the username and group attributes.

- To test tunnel mode, go to the *Remote Access* tab in FortiClient. Click the *SAML Login* button.
- A FortiAuthenticator web login page opens within FortiClient. Enter the Okta credentials, then log in to connect to the VPN tunnel.

To troubleshoot the configuration:

You can view FortiOS event logs in *Log & Report > Events* to verify successful authentication and user group allocation.

You can also run the `diagnose debug application samld -1` command to verify that the SAML IdP sent the correct information. The following shows example output for this scenario:

```
saml_send_common_reply [123]: Attr: 17, 27, 'magic=0070f471c8cddc4'
saml_send_common_reply [120]: Attr: 10, 33, 'username' 'tsmith@fortiad.info'
saml_send_common_reply [120]: Attr: 10, 39, 'group' 'Everyone'
saml_send_common_reply [120]: Attr: 10, 35, 'group' 'corporate-saml'
saml_send_common_reply [123]: Attr: 11, 1124, 'https://fortinetgw.oxia.com/app/fortinetorg878484_fortigate_1/ek183foxa8gk5qy4x7/slo/saml?SAMLRequest=FZLNauWw

SSL VPN with Azure AD SSO integration

You can use SAML single sign on to authenticate against Azure Active Directory with SSL VPN SAML user via tunnel and web modes. See:

- Configuring SAML SSO login for SSL VPN with Azure AD acting as SAML IdP
- Tutorial: Azure AD SSO integration with FortiGate SSL VPN

SSL VPN to IPsec VPN

This is a sample configuration of site-to-site IPsec VPN that allows access to the remote endpoint via SSL VPN.

This example uses a pre-existing user group, a tunnel mode SSL VPN with split tunneling, and a route-based IPsec VPN between two FortiGate. All sessions must start from the SSL VPN interface.

If you want sessions to start from the FGT_2 subnet, you need more policies. Also, if the remote subnet is beyond FGT_2 (if there are multiple hops), you need to include the SSL VPN subnet in those routers as well.

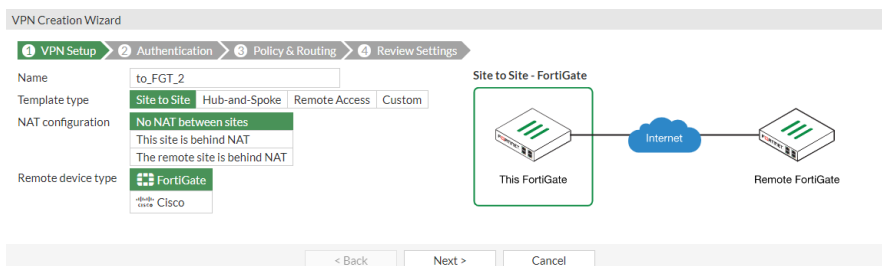

Sample topology

Sample configuration

To configure the site-to-site IPsec VPN on FGT_1:

1. Go to **VPN > IPsec Wizard**.
2. In the **VPN Setup** pane:
 - a. Specify the VPN connection *Name* as **to_FGT_2**.
 - b. Select **Site to Site**.

- c. Click **Next**.
3. In the **Authentication** pane:

- a. Enter the *IP Address* to the Internet-facing interface.
- b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key*.

VPN Creation Wizard

1 VPN Setup 2 Authentication 3 Policy & Routing 4 Review Settings

Remote device: **IP Address** Dynamic DNS

Remote IP address: 11.101.1.2

Outgoing interface: port1

Authentication method: **Pre-shared Key** Signature

Pre-shared key:

Site to Site - FortiGate

< Back Next > Cancel

- c. Click *Next*.

4. In the *Policy & Routing* pane:

- a. Set the *Local Interface* to the internal interface.
- b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_1.
- c. Set *Remote Subnets* to include the internal subnet for FGT_2.

VPN Creation Wizard

1 VPN Setup 2 Authentication 3 Policy & Routing 4 Review Settings

VPN Creation Wizard

1 VPN Setup 2 Authentication 3 Policy & Routing 4 Review Settings

The following settings should be reviewed prior to creating the VPN.

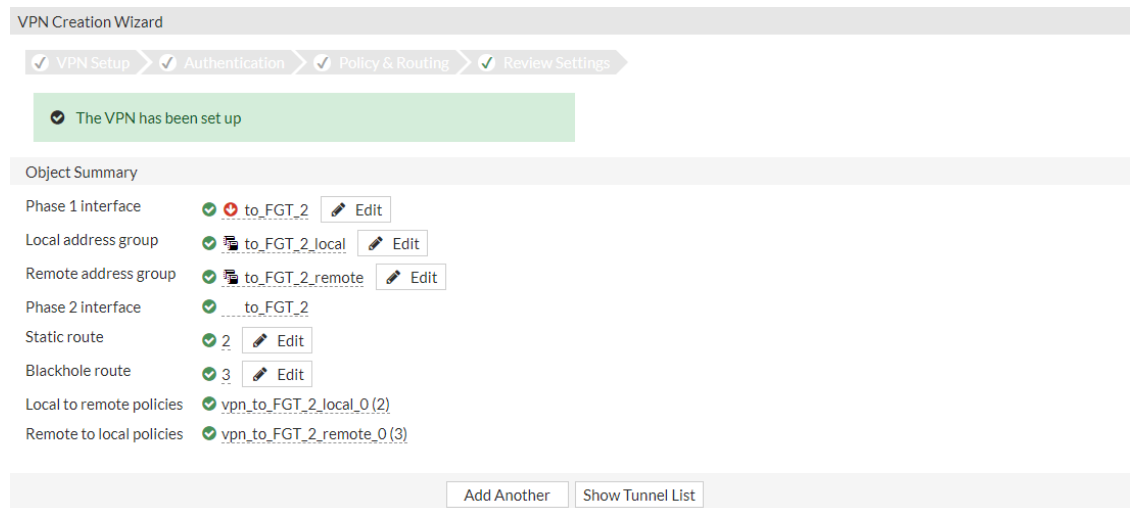

Object Summary

Phase 1 Interface	to_FGT_2
Local address group	to_FGT_2_local
Remote address group	to_FGT_2_remote
Phase 2 Interface	to_FGT_2
Static route	static
Blackhole route	static
Local to remote policies	vpn_to_FGT_2_local
Remote to local policies	vpn_to_FGT_2_remote

< Back Create Cancel

5. Review the VPN settings and click *Create*.

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To configure SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *wan1*.
3. To avoid port conflicts, set *Listen on Port* to *10443*.
4. Set *Restrict Access* to *Allow access from any host*.
5. In the *Tunnel Mode Client Settings* section, select *Specify custom IP ranges* and include the SSL VPN subnet range created by the *IPsec Wizard*.
6. In the *Authentication/Portal Mapping* section, add the *VPN user group* to the *tunnel-access Portal*. Set *All Other Users/Groups* to the *web-access Portal*.

SSL-VPN Settings

Connection Settings

Enable SSL-VPN ☒

Listen on Interface(s) wan1

Listen on Port 1443

Web mode access will be listening at <https://192.168.0.120:1443>

Redirect HTTP to SSL-VPN ☒

Restrict Access Allow access from any host Limit access to specific hosts

Idle Logout ☒

Inactive For 300 Seconds

Server Certificate Fortinet_Factory

You are using a default built-in certificate, which will not be able to verify your server's domain name (your users will see a warning). Let's Encrypt can be used to easily generate a trusted certificate if you do not have one. To do this simply import a new local certificate and select type "Automated". [Click here to learn more](#)

Require Client Certificate ☐

Security Rating Issues

Show Dismissed ☐

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the [SSL VPN best practices on page 2044](#) and learn how to [Procuring and importing a signed SSL certificate on page 2721](#).

7. Click *Apply*.

To configure SSL VPN portal:

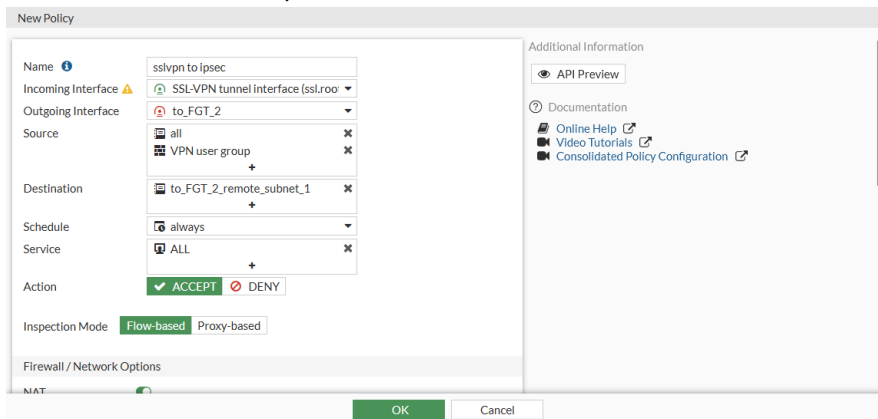

1. Go to *VPN > SSL-VPN Portals*.
2. Select *tunnel-access* and click *Edit*.
3. Turn on *Enable Split Tunneling* so that only traffic intended for the local or remote networks flow through FGT_1 and follows corporate security profiles.
4. For *Routing Address*, add the local and remote IPsec VPN subnets created by the *IPsec Wizard*.
5. For *Source IP Pools*, add the SSL VPN subnet range created by the *IPsec Wizard*.

6. Click **OK**.

To add policies to FGT_1:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a policy that allows SSL VPN users access to the IPsec VPN tunnel.
3. For *Incoming Interface*, select *ssl.root*.
4. For *Outgoing Interface*, select the IPsec tunnel interface *to_FGT_2*.
5. Set the *Source* to *all* and the *VPN user group*.
6. Set *Destination* to the remote IPsec VPN subnet.
7. Specify the *Schedule*.
8. Set the *Service* to *ALL*.
9. In the *Firewall/Network Options* section, disable *NAT*.

10. Click **OK**.

To configure the site-to-site IPsec VPN on FGT_2:

1. Go to *VPN > IPsec Wizard*.
2. In the *VPN Setup* pane:
 - a. Specify the VPN connection *Name* as *to_FGT_1*.
 - b. Select *Site to Site*.

- c. Click *Next*.
3. In the *Authentication* pane:
 - a. Enter the *IP Address* to the Internet-facing interface.
 - b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key* of the FGT_1.
 - c. Click *Next*.
4. In the *Policy & Routing* pane:
 - a. Set the *Local Interface* to the internal interface.
 - b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_2.
 - c. Set *Remote Subnets* to include the internal subnet for FGT_1.
 - d. Click *Create*.

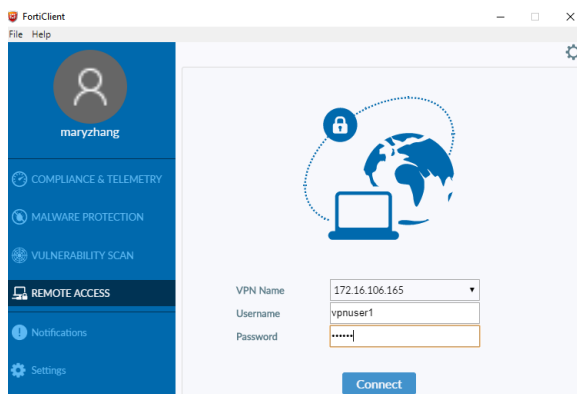

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To check the results:

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand to full screen view.
2. Select the tunnel and click *Bring Up*.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
to_FGT_2	11.101.1.2		0 B	0 B	to_FGT_2	to_FGT_2

3. Verify that the *Status* changes to *Up*.
4. Configure the SSL VPN connection on the user's FortiClient and connect to the tunnel.

5. On the user's computer, send a ping through the tunnel to the remote endpoint to confirm access:

```
C:\>ping 172.16.200.55
```

```
Pinging 172.16.200.55 with 32 bytes of data:
Reply from 172.16.200.55: bytes=32 times=2ms TTL=62
Reply from 172.16.200.55: bytes=32 times=1ms TTL=62
Reply from 172.16.200.55: bytes=32 times=1ms TTL=62
Reply from 172.16.200.55: bytes=32 times=1ms TTL=62
```

```
Ping statistics for 172.16.200.55:
```

```
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip time in milli-seconds:  
Minimum = 1ms, Maximum = 2ms, Average = 1ms
```

6. In FortiOS, go to the following pages for further verification:
 - a. Go to *Dashboard > Network* and click the *Routing* widget to verify the IPsec and SSL VPNs are added.
 - b. Go to *VPN > SSL-VPN Clients* to verify the connected users.
 - c. Go to *VPN > VPN Location Map* to view the connection activity.
 - d. Go to *Log & Report > System Events* and select the *VPN Events* card to view tunnel statistics.
 - e. Go to *Dashboard > FortiView Policies* to view the policy usage.

Troubleshooting

To troubleshoot on FGT_1, use the following CLI commands:

```
diagnose debug reset  
diagnose debug flow show function-name enable  
diagnose debug flow show iprope enable  
diagnose debug flow filter addr 172.16.200.55  
diagnose debug flow filter proto 1  
diagnose debug flow trace start 2  
diagnose debug enable
```

To troubleshoot using ping:

1. Send a ping through the SSL VPN tunnel to 172.16.200.55 and analyze the output of the debug.
2. Disable the debug output with: `diagnose debug disable`.

If traffic is entering the correct VPN tunnel on FGT_1, then run the same commands on FGT_2 to check whether the traffic is reaching the correct tunnel. If it is reaching the correct tunnel, confirm that the SSL VPN tunnel range is configured in the remote side quick mode selectors.

To troubleshoot using a sniffer command:

```
diagnose sniff packet any "host 172.16.200.44 and icmp" 4
```

To troubleshoot IPsec VPN issues, use the following commands on either FortiGate:

```
diagnose debug reset  
diagnose vpn ike gateway clear  
diagnose debug application ike -1  
diagnose debug enable
```

SSL VPN protocols

The following topics provide information about SSL VPN protocols:

- [TLS 1.3 support on page 2176](#)
- [SMBv2 support on page 2176](#)
- [DTLS support on page 2177](#)

TLS 1.3 support

FortiOS supports TLS 1.3 for SSL VPN.

TLS 1.3 support requires IPS engine 4.205 or later and endpoints running FortiClient 6.2.0 or later.

To establish a client SSL VPN connection with TLS 1.3 to the FortiGate:

1. Enable TLS 1.3 support using the CLI:

```
config vpn ssl setting
    set ssl-max-proto-ver tls1-3
    set ssl-min-proto-ver tls1-3
end
```
2. Configure the SSL VPN settings (see [SSL VPN full tunnel for remote user on page 2054](#)).
3. Configure the firewall policy (see [Firewall policy on page 1177](#)).
4. For Linux clients, ensure OpenSSL 1.1.1a is installed:
 - a. Run the following commands in the Linux client terminal:

```
root@PC1:~/tools# openssl
OpenSSL> version
```

 If OpenSSL 1.1.1a is installed, the system displays a response like the following:

```
OpenSSL 1.1.1a 20 Nov 2018
```
5. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to SSL VPN:
 - a. Run the following command in the Linux client terminal:

```
#openssl s_client -connect 10.1.100.10:10443 -tls1_3
```
6. Ensure the SSL VPN connection is established with TLS 1.3 using the CLI:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

 The system displays a response like the following:

```
[207:root:1d]SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
```

Deep inspection (flow-based)

FortiOS supports TLS 1.3 for policies that have the following security profiles applied:

- Web filter profile with flow-based inspection mode enabled.
- Deep inspection SSL/SSH inspection profile.

For example, when a client attempts to access a website that supports TLS 1.3, FortiOS sends the traffic to the IPS engine. The IPS engine then decodes TLS 1.3 and the client is able to access the website.

SMBv2 support

On all FortiGate models, SMBv2 is enabled by default for SSL VPN. Client PCs can access the SMBv2 server using SSL VPN web-only mode.

To configure SMBv2:

1. Set the minimum and maximum SMB versions.

```
config vpn ssl web portal
    edit portal-name
        set smb-min-version smbv2
        set smb-max-version smbv3
    next
end
```

2. Configure the SSL VPN settings (see [SSL VPN full tunnel for remote user on page 2054](#)).
3. Configure the firewall policy (see [Firewall policy on page 1177](#)).
4. Connect to the SSL VPN web portal and create an SMB bookmark for the SMBv2 server.
5. Click the bookmark to connect to the SMBv2 server.
6. On the FortiGate, use package capture to verify that SMBv2 works:

8	-440785802.3...	172.16.200.10	172.16.200.44	SMB2	252 Negotiate Protocol Request
9	-440785802.3...	172.16.200.44	172.16.200.10	SMB2	338 Negotiate Protocol Response

DTLS support

FortiOS Datagram Transport Layer Security (DTLS) allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

To establish a client SSL VPN connection with DTLS to the FortiGate:

1. Enable the DTLS tunnel in the CLI:

```
config vpn ssl setting
    set dtls-tunnel enable
end
```

2. Configure the SSL VPN settings (see [SSL VPN full tunnel for remote user on page 2054](#)).
3. Configure the firewall policy (see [Firewall policy on page 1177](#)).
4. In FortiClient, use the *Preferred DTLS Tunnel* option to connect to SSL VPN with DTLS:
 - a. Go to *Settings* and expand the *VPN Options* section.
 - b. Enable *Preferred DTLS Tunnel*.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

- c. Click *Save*.

5. In FortiOS, run diagnostics to ensure the SSL VPN connection is established with DTLS:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

The system displays a response like the following:

```
[304:vdom1:7]DTLS established: DTLSv1 ECDHE-RSA-AES256-GCM-SHA384
```

Configuring the DTLS heartbeat parameters

The DTLS heartbeat parameters for SSL VPN can be adjusted. This improves the success rate of establishing a DTLS tunnel in networks with congestion or jitter.

```
config vpn ssl settings
    set dtls-heartbeat-idle-timeout <integer>
    set dtls-heartbeat-interval <integer>
    set dtls-heartbeat-fail-count <integer>
end
```

dtls-heartbeat-idle-timeout <integer>	Set the idle timeout before the DTLS heartbeat is sent, in seconds (3 - 10, default = 3).
dtls-heartbeat-interval <integer>	Set the interval between DTLS heartbeats, in seconds (3 - 10, default = 3).
dtls-heartbeat-fail-count <integer>	Set the number of missing heartbeats before the connection is considered dropped, in seconds (3 - 10, default = 3).

To configure the DTLS heartbeat parameters:

```
config vpn ssl settings
    set dtls-heartbeat-idle-timeout 3
    set dtls-heartbeat-interval 3
    set dtls-heartbeat-fail-count 3
end
```

To verify the configuration:

1. Run diagnostics on the client side:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
00:00:03 S:058.000B(000.000B/s) R:000.000B(000.000B/s) Sd: 0 0.0000%DEBUG fsv_tun_send_
clt_hb:812 send heartbeat.
00:00:06 S:135.000B(000.000B/s) R:000.000B(000.000B/s) Sd: 0 0.0000%DEBUG fsv_client_on_
read:575 got type heartbeat
00:00:07 S:135.000B(000.000B/s) R:019.000B(019.000B/s) Sd: 0 0.0000%DEBUG fsv_tun_send_
clt_hb:812 send heartbeat.
00:00:09 S:154.000B(000.000B/s) R:019.000B(000.000B/s) Sd: 0 0.0000%DEBUG fsv_client_on_
read:575 got type heartbeat
00:00:10 S:154.000B(000.000B/s) R:038.000B(019.000B/s) Sd: 0 0.0000%DEBUG fsv_tun_send_
clt_hb:812 send heartbeat.
00:00:13 S:173.000B(000.000B/s) R:038.000B(000.000B/s) Sd: 0 0.0000%DEBUG fsv_tun_send_
clt_hb:812 send heartbeat.
```

The heartbeat starts being sent after the idle timeout, and the heartbeat is sent every three seconds.

2. Run diagnostics on the server side:

```
root@auto-pc147:/home/auto# ./sslvpn/perf_test/fsvc-0.90/build/fsvc -s 10.1.100.2 -n
1443 -u u1 -p 1 --dtls -d debug
...
2023-04-26 12:01:40 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message:
heartbeat 10.1.100.147
2023-04-26 12:01:41 [304:vdom1:5]sslvpn_dtls_handle_client_data:758 0x7f1f2743e800 got
```

```

heartbeat
2023-04-26 12:01:44 [304:vdom1:5]sslvpn_dtls_handle_client_data:758 0x7f1f2743e800 got
heartbeat
2023-04-26 12:01:46 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message:
heartbeat 10.1.100.147
2023-04-26 12:01:50 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message:
heartbeat 10.1.100.147
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message:
heartbeat 10.1.100.147
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_dtls_timeout_check:358 no heartbeat received for
9 seconds.
2023-04-26 12:01:54 [304:vdom1:5]fsv_disassociate_fd_to_ipaddr:2367 deassociate
10.11.12.1 from tun (ssl.vdom1:12)
2023-04-26 12:01:54 [304:vdom1:5]dtls_tun_link_down:1884 tunnel device (12) closed
2023-04-26 12:01:54 [304:vdom1:5]tunnel is down, wait for next connection.
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_release_dynip:1597 free app session, idx[0]
2023-04-26 12:01:54 [304:vdom1:5]release dyip
2023-04-26 12:01:54 [304:vdom1:5]Destroy sconn 0x7f1f2743e800, connSize=0. (vdom1)

```

The tunnel is disconnected once the dtls-heartbeat-fail-count is reached.

3. Use a Linux traffic control (tc) utility to introduce packet loss of 30% on the interface connected to the FortiGate (ens192):

```
root@auto-pc147:~# tc qdisc add dev ens192 root netem loss 30%
```

4. Run a ping test. The results show that the network has jitter/congestion as 33% of packets are being lost:

```

root@auto-pc147:~# ping 10.1.100.2 -c 100
PING 10.1.100.2 (10.1.100.2) 56(84) bytes of data.
64 bytes from 10.1.100.2: icmp_seq=1 ttl=255 time=0.111 ms
64 bytes from 10.1.100.2: icmp_seq=2 ttl=255 time=0.106 ms
...
64 bytes from 10.1.100.2: icmp_seq=99 ttl=255 time=0.103 ms
64 bytes from 10.1.100.2: icmp_seq=100 ttl=255 time=0.097 ms

--- 10.1.100.2 ping statistics ---
100 packets transmitted, 67 received, 33% packet loss, time 101382ms
rtt min/avg/max/mdev = 0.088/0.104/0.141/0.009 ms

```

5. Run diagnostics again on the server side to verify that the DTLS tunnel is established:

```

# diagnose debug application sslvpn -l
# diagnose debug enable
[307:vdom1:9]form_ipv4_pol_split_tunnel_addr:113 Matched policy (id = 14) to add ipv4
split tunnel routing address
[307:vdom1:9]SSL state:warning close notify (10.1.100.147)
[307:vdom1:9]sslConnGotoNextState:311 error (last state: 1, closeOp: 0)
[307:vdom1:9]Destroy sconn 0x7f1f27454800, connSize=0. (vdom1)
[307:vdom1:9]SSL state:warning close notify (10.1.100.147)
[304:vdom1:7]allocSSLConn:310 sconn 0x7f1f2743e800 (1:vdom1)
[304:vdom1:7]DTLS established: DTLSv1 ECDHE-RSA-AES256-GCM-SHA384 from 10.1.100.147

```

Configuring OS and host check

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the network from an outside source. These include verifying OS and performing host checks on software running on the remote device.

Verifying remote user OS

To verify that remote users are using devices with up-to-date Operating Systems to connect to your network, you can configure a host check for Windows and Mac OS. You can configure an OS host check for specific OS versions, such as Windows 7, 8.1, 10, and 11.

To configure an OS host check for specific OS versions:

1. Go to *VPN > SSL-VPN*.
2. Click *Create New*.
3. Enable *Restrict to Specific OS Versions*.
4. Select an OS version and click *Edit* to change the action.
5. Select the action:
 - *Allow*: The selected OS version is allowed to connect. This is the default action.
 - *Block*: The selected OS version is not allowed to connect.
 - *Check up to date*: Specify a *Tolerance* and *Latest patch level* that is allowed for the selected OS version.
6. Click *OK*.
7. Configure other parameters as needed.
8. Click *OK*.

Host check

Host check verifies whether the client device has AntiVirus, firewall, both, or other custom security software enabled on their Windows device. Admins may also define their own custom host check software, which supports Windows and Mac OS. See [Creating a custom host check list on page 2182](#).

Host Check is only available for SSL VPN tunnel mode.

To configure host checking:

1. Go to *VPN > SSL-VPN Portal*.
2. Click *Create New*.
3. Enable *Host Check*.
4. Set the *Type*:
 - *Realtime AntiVirus*: Checks that AntiVirus software recognized by Windows Security Center is enabled.
 - *Firewall*: Checks that firewall software recognized by Windows Security Center is enabled.
 - *Enable both*: Checks that both *Realtime AntiVirus* and *Firewall* are enabled.
 - *Custom*: Not configurable from the GUI. See CLI settings below.
5. Configure other parameters as needed.
6. Click *OK*.

You can configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software.

To configure custom host checking:

```
config vpn ssl web portal
  edit full-access
    set host-check custom
    set host-check-policy FortiClient-AV FortiClient-FW
  next
end
```

Many other security software can also be configured. Use `set host-check-policy ?` to see a list of software.

Replacing the host check error message

You can add your own host security check error message using either the GUI or the CLI. The default message reads:

```
Your PC does not meet the host checking requirements set by the firewall. Please try again
in a few minutes. If the issue persists check that your OS version meets the minimum
requirements, that your antivirus and firewall applications are installed and running
properly, and that you have the correct network interface.
```

To replace the host check error message in the GUI:

1. Go to *System > Replacement Messages*.
2. Select *Extended View* in the upper right corner.
3. Scroll down to *SSL-VPN* and select *Hostcheck Error Message*.
4. Click *Edit*. The *Hostcheck Error Message* pane opens.
5. Edit the text in the right-hand column.
6. Click *Save*.

If you are unhappy with the new message, you can restore the message to its default by selecting *Restore Defaults* instead of *Save*.

MAC address check

Aside from OS and Host check, FortiGate can also perform a MAC address check on the remote host.

To configure a MAC address check on the remote host in the CLI:

```
config vpn ssl web portal
  edit <portal_name>
    set mac-addr-check enable
    config mac-addr-check-rule
      edit <rule_name>
        set mac-addr-list <address> [address]
        set mac-addr-mask <mask between 1-48>
      next
    end
    set set mac-addr-action {allow | deny}
  next
end
```

Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms.

To add software requirements to the host check list:

```
config vpn ssl web host-check-software
  edit <software_name>
    set os-type {windows | macos}
    set type {av | fw}
    set version <version_number>
    set guid <guid_value>
    config check-item-list
      edit <ID>
        set action {require | deny}
        set type {file | registry | process}
        set target <target string>
      next
    end
  next
end
```

```

        set version <version string>
        set md5s <hex string>
    next
end
next
end

```

If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the `HKEY_CLASSES_ROOT` section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select *Properties*, then select the *Version* tab.

Example: Tunnel Mode Host Check - Registry Key Check

The following example configuration checks if a required registry key is present on a Windows device.

```

config vpn ssl web host-check-software
    edit <computer_name>
        config check-item-list
            edit 1
                set target "HKEY_LOCAL_
MACHINE\\SYSTEM\\CurrentControlSet\\Control\\ComputerName\\ActiveComputerName:ComputerName=W
INXP32SP3B62"
                set type registry
            next
        end
    next
end

```

Example: Tunnel Mode Host Check - Application Running Check

The following example configuration checks if a required application is installed and/or running:

```

config vpn ssl web host-check-software
    edit "calc"
        config check-item-list
            edit 1
                set target "calc.exe"
                set type process
            next
        end
    next
end

```

Example: Mac OS host check and process check

The `os-type` option is available under `vpn ssl web host-check-software`; if `os-type` is `macos`, then `type`, `version` and `guid` are hidden. Furthermore, `type` in `check-item-list` can only be set to `file` or `process`.

```

config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list macos-bigsur-11
            set action {allow | deny | check-up-to-date}

```

```

        set tolerance <value>
        set latest-patch-level <value>
    end
next
end
config vpn ssl web host-check-software
    edit <name>
        set os-type macos
        config check-item-list
            edit <name>
                set type process
                set target <target process>
            next
        end
    next
end

```

Example: Configuring Windows OS Check with patch version

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

To specify the acceptable patch level, you set the `latest-patch-level` and the `tolerance`. The lowest acceptable patch level is `latest-patch-level` minus *tolerance*. In this case, *latest-patch-level* is three and *tolerance* is one, so two is the lowest acceptable patch level.

To configure OS check:

```

config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list <windows OS version>
            set action {allow | check-up-to-date | deny}
            set latest-patch-level {disable | 0 - 65535}
            set tolerance <tolerance_num>
        end
    next
end

```

Example: Host check for Windows firewall

The Windows built-in firewall does not have a GUID in `root\securitycenter` or `root\securitycenter2`, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to one:

- **KeyName:** HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile
- **ValueName:** EnableFirewall

In FortiOS, use the `registry-value-check` feature to define the Windows firewall software.

To define the Windows firewall software:

```

config vpn ssl web host-check-software
    edit "Microsoft-Windows-Firewall"
        set type fw
        config check-item-list
            edit 1
                set target
                "HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\StandardProfile:EnableFirewall==1"
                set type registry
            next
            edit 2
                set target
                "HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\PublicProfile:EnableFirewall==1"
                set type registry
            next
            edit 3
                set target
                "HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\DomainProfile:EnableFirewall==1"
                set type registry
            next
        end
    next
end
config vpn ssl web portal
    edit <portal_name>
        set host-check custom
        set host-check-policy Microsoft-Windows-Firewall
    next
end

```

Troubleshooting

To troubleshoot OS and host check, enable the following real-time debugs from the CLI:

```

# diagnose debug app sslvpn -1
# diagnose debug enable

```

From the remote client, connect to SSL VPN. Look for debug output similar to the following:

```
[263:root:3cca1]host check result:4 0100,10.0.19042,74:78:27:4d:81:93|84:1b:77:3a:95:84
```

To interpret the above output:

Field	Description
host check result: 4	This is the hex number of portal's host check value: <ul style="list-style-type: none"> 0: None 1: Check antivirus 2: Check firewall 3: Check antivirus and firewall

Field	Description
	<ul style="list-style-type: none"> 4: Custom check
0100	<p>The 4 bytes shows the result of host check checking in the FortiGate Settings. Position counts from left to right, zero to three:</p> <ul style="list-style-type: none"> Position zero means result of third party firewall. Position one means result of third party antivirus. Position two means result of FortiClient firewall. Position three means result of FortiClient antivirus. <p>0 means not in use. 1 means in use.</p>
10.0.19042	This is the OS version.
74:78:27:4d:81:93 84:1b:77:3a:95:84	The MAC address of the client machine's network interface, that is used for the mac address check. Multiple MAC address are separately by ' '.

FortiGate as SSL VPN Client

The FortiGate can be configured as an SSL VPN client, using an *SSL-VPN Tunnel* interface type. When an SSL VPN client connection is established, the client dynamically adds a route to the subnets that are returned by the SSL VPN server. Policies can be defined to allow users that are behind the client to be tunneled through SSL VPN to destinations on the SSL VPN server.

FortiOS can be configured as an SSL VPN server that allows IP-level connectivity in tunnel mode, and can act as an SSL VPN client that uses the protocol used by the FortiOS SSL VPN server. This allows hub-and-spoke topologies to be configured with FortiGates as both the SSL VPN hub and spokes.

For an IP-level VPN between a device and a VPN server, this can be useful to avoid issues caused by intermediate devices, such as:

- ESP packets being blocked.
- UDP ports 500 or 4500 being blocked.
- Fragments being dropped, causing IKE negotiation that uses large certificates to fail if the peer does not support IKE fragmentation.

If the client specified destination is *all*, a default route is effectively dynamically created on the SSL VPN client, and the new default route is added to the existing default route in the form of ECMP. Some examples how to configure routing are:

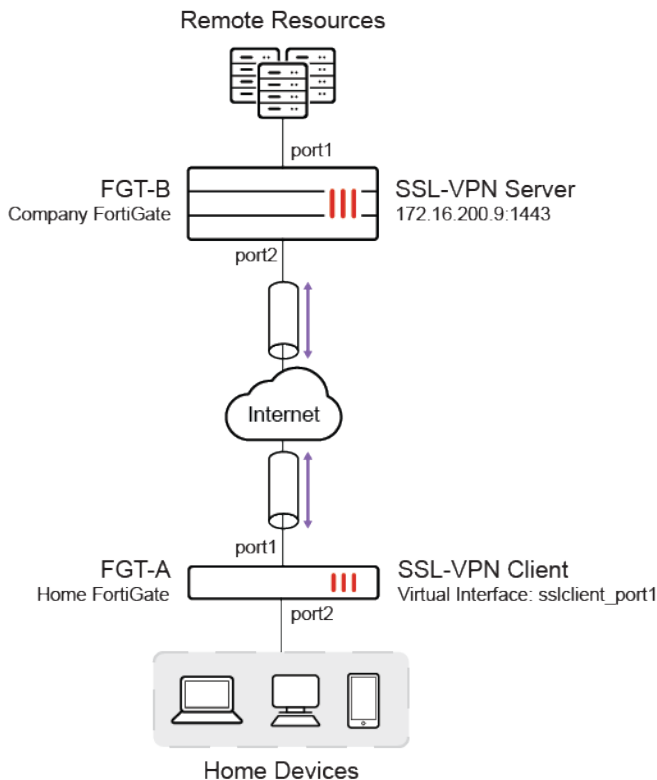

- To make all traffic default to the SSL VPN server and still have a route to the server's listening interface, on the SSL VPN client set a lower distance for the default route that is learned from the server.
- To include both default routes in the routing table, with the route learned from the SSL VPN server taking priority, on the SSL VPN client set a lower distance for the route learned from the server. If the distance is already zero, then increase the priority on the default route.
- To avoid a default being learned on the SSL VPN client, on the SSL VPN server define a specific destination.

Example

In this example, the home FortiGate (FGT-A) is configured as an SSL VPN client, and the company FortiGate (FGT-B) is configured as an SSL VPN server. After FGT-A connects to FGT-B, the devices that are connected to FGT-A can access the resources behind FGT-B.

The SSL VPN server has a custom server certificate defined, and the SSL VPN client user uses PSK and a PKI client certificate to authenticate. The FortiGates must have the proper CA certificate installed to verify the certificate chain to the root CA that signed the certificate.

Split tunneling is used so that only the destination addresses defined in the server's firewall policies are routed to the server, and all other traffic is connected directly to the internet.

Configure the SSL VPN server

To create a local user in the GUI:

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Use the wizard to create a local user named *client2*.

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication > PKI* and click *Create New*.
2. Set the *Name* to *pki*.
3. Set *CA* to the CA certificate that is used to verify the client certificate.

4. Click *OK*.
5. In the CLI, specify the CN that must be matched. If no CN is specified, then any certificate that is signed by the CA will be valid and matched.

```
config user peer
    edit "pki"
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN portal in the GUI:

1. Go to *VPN > SSL-VPN Portals* and click *Create New*.
2. Set the *Name* to *testportal2*.
3. Set *Enable Split Tunneling* to *Enabled Based on Policy Destination*.
4. Set *Source IP Pools* to *SSLVPN_TUNNEL_ADDR1*.
5. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings* and enable *Enable SSL-VPN*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Set *Server Certificate* to *fgt_gui_automation*.
5. In the *Authentication/Portal Mapping* table click *Create New*:
 - a. Set *Users/Groups* to *client2*.
 - b. Set *Portal* to *testportal2*.
 - c. Click *OK*.
6. Click *OK*.
7. In the CLI, enable SSL VPN client certificate restrictive and set the user peer to *pki*:

```
config vpn ssl settings
    config authentication-rule
        edit 1
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

To create a firewall address in the GUI:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set the *Name* to *bing.com*.
3. Set *Type* to *FQDN*.
4. Set *FQDN* to *www.bing.com*.
5. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	<i>sslvpn2</i>
Incoming Interface	<i>SSL-VPN tunnel interface (ssl.root)</i>
Outgoing Interface	<i>port1</i>
Source	<i>Address: all</i> <i>User: client2</i>
Destination	<i>bing.com</i> : This FQDN resolves to 13.107.21.200 and 204.79.197.200. Traffic to these addresses is directed to the SSL VPN, while other traffic is routed to the remote devices' default adapters or interfaces. <i>mantis</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>Accept</i>

3. Click *OK*.

To configure the SSL VPN server (FGT-B) in the CLI:

1. Create a local user:

```
config user local
  edit "client2"
    set passwd *****
  next
end
```

2. Create a PKI user:

```
config user peer
  edit "pki"
    set ca "CA_Cert_3"
    set cn "*.fos.automation.com"
  next
end
```

3. Create a new SSL VPN portal:

```

config vpn ssl web portal
    edit "testportal2"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set ipv6-split-tunneling enable
        ....
    next
end

```

4. Configure SSL VPN settings, including the authentication rule for user mapping:

```

config vpn ssl settings
    set ssl-min-proto-ver tls1-1
    set servercert "fgt_gui_automation"
    set auth-timeout 0
    set login-attempt-limit 10
    set login-timeout 180
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-suffix "sslvpn.com"
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    config authentication-rule
        edit 1
            set users "client2"
            set portal "testportal2"
            set client-cert enable
            set user-peer "pki"
        next
    end
end

```

5. Create a firewall address and policy. The destination addresses used in the policy are routed to the SSL VPN server.

```

config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end

config firewall policy
    edit 2
        set name "sslvpn2"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "mantis" "bing.com"
        set action accept
        set schedule "always"
    end

```

```
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

Configure the SSL VPN client

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication > PKI* and click *Create New*.
2. Set the *Name* to *fgt_gui_automation*.
3. Set *CA* to the CA certificate. The CA certificate allows the FortiGate to complete the certificate chain and verify the server's certificate, and is assumed to already be installed on the FortiGate.
4. Click *OK*.
5. In the CLI, specify the CN of the certificate on the SSL VPN server:

```
config user peer
    edit "fgt_gui_automation"
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN client and virtual interface in the GUI:

1. Go to *VPN > SSL-VPN Clients* and click *Create New*.
2. Expand the *Interface* drop down and click *Create* to create a new virtual interface:
 - a. Set the *Name* to *sslclient_port1*.
 - b. Set *Interface* to *port1*.
 - c. Under *Administrative Access*, select *HTTPS* and *PING*.

d. Click OK.

3. Configure the SSL VPN client:

Name	<i>sslclientTo9</i>
Interface	<i>sslclient_port1</i>
Server	<i>172.16.200.9</i>
Port	<i>1443</i>
Username	<i>client2</i>
Pre-shared Key	<i>*****</i>
Client Certificate	<i>fgtb_gui_automation</i> This is the local certificate that is used to identify this client, and is assumed to already be installed on the FortiGate. The SSL VPN server requires it for authentication.
Peer	<i>fgt_gui_automation</i>
Administrative Distance	Configure as needed.
Priority	Configure as needed.
Status	Enabled

4. Click OK.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	<i>policy_to_sslvpn_tunnel</i>
Incoming Interface	<i>port2</i>
Outgoing Interface	<i>sslclient_port1</i>

Source	<i>all</i>
Destination	<i>all</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>Accept</i>

3. Click OK.

To configure the SSL VPN client (FGT-A) in the CLI:

1. Create the PKI user. Use the CA that signed the certificate *fgt_gui_automation*, and the CN of that certificate on the SSL VPN server.

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Create the SSL interface that is used for the SSL VPN connection:

```
config system interface
    edit "sslclient_port1"
        set vdom "vdom1"
        set allowaccess ping https
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port1"
    next
end
```

3. Create the SSL VPN client to use the PKI user and the client certificate *fgtb_gui_automation*:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port1"
        set user "client2"
        set psk 123456
        set peer "fgt_gui_automation"
        set server "172.16.200.9"
        set port 1443
        set certificate "fgtb_gui_automation"
    next
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "port2"
        set dstintf "sslclient_port1"
        set srcaddr "all"
```

```

        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

Verification

After the tunnel is established, the route to 13.107.21.200 and 204.79.197.200 on FGT-A connects through the SSL VPN virtual interface *sslclient_port1*.

To check the routing table details:

```

(vdom1) # get router info routing-table details
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

```

```

Routing table for VRF=0
S*    0.0.0.0/0 [10/0] via 172.16.200.254, port1
C     10.0.1.0/24 is directly connected, link_11
C     10.1.100.0/24 is directly connected, port2
           is directly connected, port2
C     10.212.134.200/32 is directly connected, sslclient_port1
S     13.107.21.200/32 [10/0] is directly connected, sslclient_port1
C     172.16.200.0/24 is directly connected, port1
S     192.168.100.126/32 [10/0] is directly connected, sslclient_port1
S     204.79.197.200/32 [10/0] is directly connected, sslclient_port1

```

To check the added routing for an IPv6 tunnel:

```

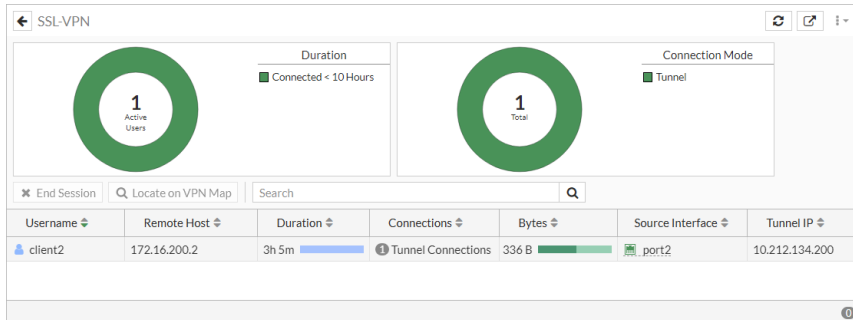

(vdom1) # get router info6 routing-table database
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, B - BGP
       > - selected route, * - FIB route, p - stale info
Timers: Uptime

S     *> ::/0 [10/0] via 2000:172:16:200::254, port1, 00:00:01, [1024/0]
       *>      [10/0] via ::, sslclient_port1, 00:00:01, [1024/0]
C     *> ::1/128 via ::, vdom1, 03:26:35
C     *> 2000:10:0:1::/64 via ::, link_11, 03:26:35
C     *> 2000:10:1:100::/64 via ::, port2, 03:26:35
C     *> 2000:172:16:200::/64 via ::, port1, 03:26:35
C     *> 2001:1::1:100/128 via ::, sslclient_port1, 00:00:01
C     *> fe80::/64 via ::, port2, 03:26:35

```

To check the connection in the GUI:

1. On the SSL VPN server FortiGate (FGT-B), go to *Dashboard > Network* and expand the *SSL-VPN* widget.

2. On the SSL VPN client FortiGate (FGT-A), go to *VPN > SSL-VPN Clients* to see the tunnel list.

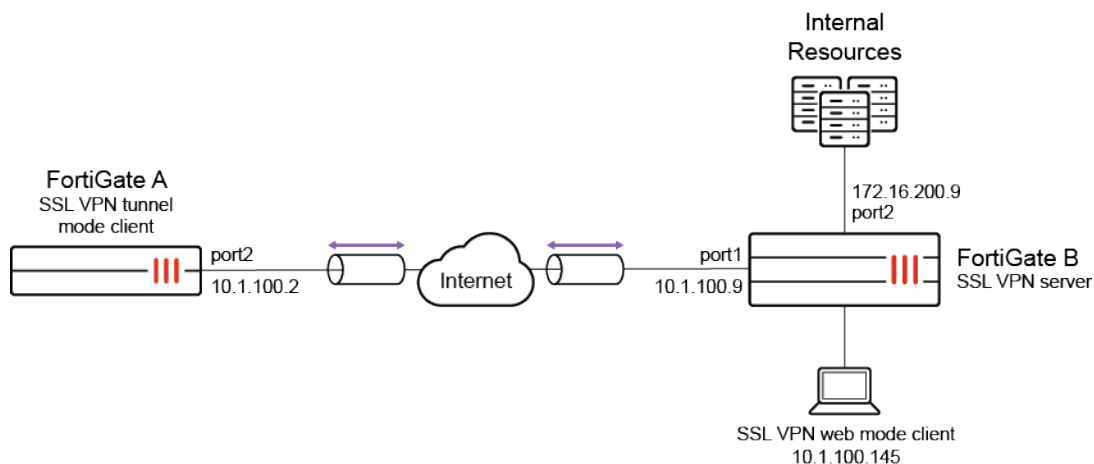

Dual stack IPv4 and IPv6 support for SSL VPN

Dual stack IPv4 and IPv6 support for SSL VPN servers and clients enables a client to establish a dual stack tunnel to allow both IPv4 and IPv6 traffic to pass through. FortiGate SSL VPN clients also support dual stack, which allows it to establish dual stack tunnels with other FortiGates.

Users connecting in web mode can connect to the web portal over IPv4 or IPv6. They can access bookmarks in either IPv4 or IPv6, depending on the preferred DNS setting of the web portal.

Example

In this example, FortiGate B works as an SSL VPN server with dual stack enabled. A test portal is configured to support tunnel mode and web mode SSL VPN.

FortiGate A is an SSL VPN client that connects to FortiGate B to establish an SSL VPN tunnel connection. It attempts to access www.bing.com and www.apple.com via separate IPv4 and IPv6 connections. Two addresses are configured on FortiGate B:

- *bing.com* uses IPv4 FQDN and resolves to 13.107.21.200 and 204.79.197.200.
- *apple_v6* uses IPv6 FQDN and resolves to 2600:140a:c000:385::1aca and 2600:140a:c000:398::1aca.

The server certificate used is `fgt_gui_automation`, and the CN is `*.fos.automation.com`.

A PC serves as a client to connect to FortiGate B in SSL VPN web mode. The PC can connect to the SSL VPN server over IPv4 or IPv6. Based on the preferred DNS setting, it will access the destination website over IPv4 or IPv6.

Dual stack tunnel mode support requires a supported client. In 7.0.0, a FortiGate in SSL VPN client mode can support dual stack tunnels. FortiClient 7.0.1 and later releases support dual stack.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the GUI:

1. Create a local user:
 - a. Go to *User & Authentication > User Definition* and click *Create New*. The *Users/Groups Creation Wizard* opens.
 - b. Set the *User Type* to *Local User* and click *Next*.
 - c. Enter the *Username* (*client2*) and password, then click *Next*.
 - d. Optionally, configure the contact information and click *Next*.
 - e. Click *Submit*.
2. Configure the addresses:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Enter the following for the IPv4 address:

Category	Address
Name	bing.com
Type	FQDN
FQDN	www.bing.com

- c. Click *OK*.
- d. Click *Create New > Address* and enter the following for the IPv6 address:

Category	IPv6 Address
Name	apple_v6
Type	FQDN
FQDN	www.apple.com

- e. Click *OK*.
3. Configure the SSL VPN portal:
 - a. Go to *VPN > SSL-VPN Portals* and click *Create New*.
 - b. Enter a name (*testportal1*).
 - c. Enable *Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
 - d. For *Source IP Pools*, add `SSLVPN_TUNNEL_ADDR1`.
 - e. Enable *IPv6 Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
 - f. For *Source IP Pools*, add `SSLVPN_TUNNEL_IPv6_ADDR1`.
 - g. Enable *Enable Web Mode*.

New SSL-VPN Portal

Name:

Limit Users to One SSL-VPN Connection at a Time: ☐

Tunnel Mode

Enable Split Tunneling

- ☐ Disabled
All client traffic will be directed over the SSL-VPN tunnel.
- ☒ **Enabled Based on Policy Destination**
Only client traffic in which the destination matches the destination of the configured firewall policies will be directed over the SSL-VPN tunnel.
- ☐ Enabled for Trusted Destinations
Only client traffic which does not match explicitly trusted destinations will be directed over the SSL-VPN tunnel.

Routing Address Override:

Source IP Pools:

IPv6 Tunnel Mode

Enable IPv6 Split Tunneling

- ☐ Disabled
All client traffic will be directed over the SSL-VPN tunnel.
- ☒ **Enabled Based on Policy Destination**
Only client traffic in which the destination matches the destination of the configured firewall policies will be directed over the SSL-VPN tunnel.
- ☐ Enabled for Trusted Destinations
Only client traffic which does not match explicitly trusted destinations will be directed over the SSL-VPN tunnel.

IPv6 Routing Address Override:

Video Tutorials

OK Cancel

h. Click OK.

4. Configure the SSL VPN settings:

- a. Go to *VPN > SSL-VPN Settings* and configure the following:

Listen on Interface(s)	port1
Listen on Port	1443
Restrict Access	Allow access from any host
Server Certificate	fgt_gui_automation
Address Range	Automatically assign addresses
DNS Server	Same as client system DNS
Authentication/Portal Mapping	Edit the <i>All Other Users/Groups</i> entry to use <i>testportal1</i> .

- b. Click *Apply*.
- c. Enable dual stack in the CLI:

```
config vpn ssl settings
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- b. Enter the following:

Name	sslvpn
Incoming Interface	ssl.root

Outgoing Interface	port2
Source	all (IPv4), all (IPv6), client2
Destination	bing.com, apple_v6
Schedule	Always
Service	All
NAT	Enabled

- c. Click **OK**.

To configure FortiGate A as an SSL VPN client in the GUI:

1. Create a peer to verify the server certificate:

The PKI menu is only available in the GUI (*User & Authentication > PKI*) after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.
If the CA is not known or is public, import the CA that signed the server certificate.

- a. Go to *User & Authentication > PKI* and click *Create New*.
- b. Set the *Name* to *fgt_gui_automation*.
- c. Set *CA* to the CA certificate that is used to verify the server certificate.
- d. Click **OK**.
- e. In the CLI, specify the CN that must be matched:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the SSL VPN client:
 - a. Go to *VPN > SSL-VPN Clients* and click *Create New*.
 - b. In the *Interface* dropdown, click *Create*.
 - i. Enter a Name (*sslclient_port2*).
 - ii. Set *Interface* to *port2*.
 - iii. Set *Role* to *LAN*.

The screenshot shows the 'New Interface' configuration window. The left sidebar lists various configuration options: Name, Interface, Alias, Server, Type, Port, Username, Pre-shared Key, Client Certificate, Peer, Administrative Dist, Priority, Status, and Comments. The main area is divided into sections: 'Name' (ssclient_port2), 'Alias' (empty), 'Type' (SSL-VPN Tunnel), 'Interface' (port1 (wan1)), and 'Role' (LAN). Below these are 'Administrative Access' settings for IPv4, including checkboxes for Speed Test, PING, SNMP, Security Fabric Connection, HTTPS, FMG-Access, FTM, HTTP, SSH, and RADIUS Accounting. The 'Traffic Shaping' section shows 'Outbound shaping profile' set to 'Off'. At the bottom are 'OK' and 'Cancel' buttons.

iv. Click OK.

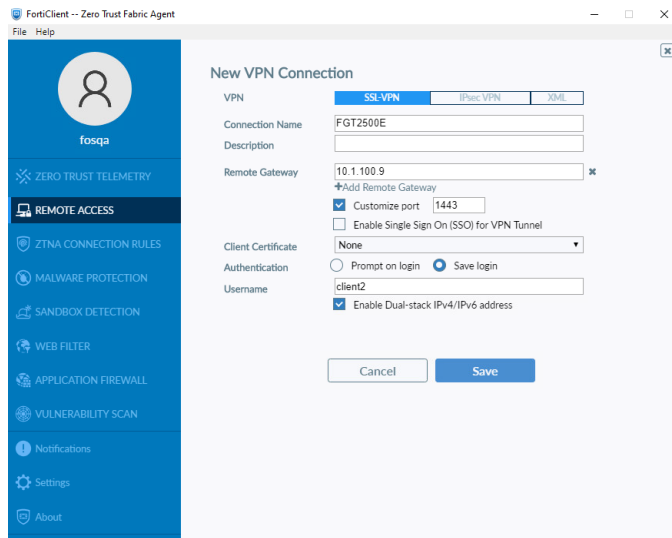

c. Configure the SSL VPN client:

Name	ssclientTo9
Interface	ssclient_port2
Server	Either IPv4 address <i>10.1.100.9</i> or IPv6 address <i>2000:10:1:100::9</i> can be used and will have the same results.
Port	1443
Username	client2
Pre-shared Key	*****
Peer	fgt_gui_automation
Status	Enabled

d. Click OK.

To configure FortiClient and connect to the VPN:

1. On the *Remote Access* tab and click *Configure VPN*, or if other connections have already been configured, click the sandwich icon and select *Add a new connection*.
2. Set *Connection Name* to *FGT2500E*, and *Remote Gateway* to *10.1.100.9*.
3. Enable *Customize port* and enter the port number *1443*.
4. Set *Username* to *client2*.
5. Enable *Enable Dual-stack IPv6/IPv6 address*.

6. Click **Save**.
7. Enter the password, then click **Connect**.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the CLI:

1. Create a local user:

```
config user local
  edit "client1"
    set type password
    set passwd *****
  next
end
```

2. Configure the addresses:

```
config firewall address
  edit "bing.com"
    set type fqdn
    set fqdn "www.bing.com"
  next
end

config firewall address6
  edit "apple_v6"
    set type fqdn
    set fqdn "www.apple.com"
  next
end
```

3. Configure the SSL VPN portal:

```
config vpn ssl web portal
  edit "testportal1"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
```

```

        set split-tunneling enable
        set ipv6-split-tunneling enable
    next
end

```

4. Configure the SSL VPN settings:

```

config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    set dual-stack-mode enable
end

```

5. Configure the firewall policy:

```

config firewall policy
    edit 1
        set name "sslvpn"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "bing.com"
        set srcaddr6 "all"
        set dstaddr6 "apple_v6"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end

```

To configure FortiGate A as an SSL VPN client in the CLI:

1. Create a peer to verify the server certificate:

```

config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end

```

2. Configure the interface:

```

config system interface
    edit "sslclient_port2"
        set vdom "vdom1"
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port2"
    next
end

```

```

    next
end

```

3. Configure the SSL VPN client. Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results:

```

config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port2"
        set user "client2"
        set psk *****
        set peer "fgt_gui_automation"
        set server {10.1.100.9 | 2000:10:1:100::9}
        set port 1443
    next
end

```

Testing dual stack with tunnel mode

To verify the SSL VPN tunnel connection in the GUI:

1. On FortiGate B, go to *Dashboard > Network*.
2. Expand the *SSL-VPN* widget.

To verify the SSL VPN tunnel connection in the CLI:

1. On FortiGate B, verify that the client is assigned with both IPv4 and IPv6 addresses:

```

(root) # get vpn ssl monitor
SSL VPN Login Users:
  Index  User   Group  Auth Type  Timeout  Auth-Timeout  From  HTTP
in/out  HTTPS in/out  Two-factor Auth
0       client2  1 (1)  292      2147483647  10.1.100.2
0/0     0/0     0

SSL VPN sessions:
  Index  User   Group  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
0       client2  10.1.100.2  5427      1756/1772  10.212.134.200,fdff:ffff::1

```

2. On FortiGate A, verify the routing tables.
 - a. IPv4 with resolved addresses for www.bing.com:

```

(vdom1) # get router info routing-table database
...
Routing table for VRF=0

```

```

S    *> 0.0.0.0/0 [10/0] via 172.16.200.254, port1
C    *> 10.0.1.0/24 is directly connected, link_11
C    *> 10.1.100.0/24 is directly connected, port2
C    *> 10.212.134.200/32 is directly connected, sslclient_port2
S    *> 13.107.21.200/32 [10/0] is directly connected, sslclient_port2
C    *> 172.16.200.0/24 is directly connected, port1
S    *> 204.79.197.200/32 [10/0] is directly connected, sslclient_port2

```

b. IPv6 with resolved addresses for www.apple.com:

```

(vdom1) # get router info6 routing-table database
...
S    *> ::/0 [10/0] via 2000:172:16:200::254, port1, 01:57:23, [1024/0]
C    *> ::1/128 via ::, vdom1, 06:12:54
C    *> 2000:10:0:1::/64 via ::, link_11, 06:12:54
C    *> 2000:10:1:100::/64 via ::, port2, 06:12:54
C    *> 2000:172:16:200::/64 via ::, port1, 06:12:54
S    *> 2600:140a:c000:385::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08,
[1024/0]
S    *> 2600:140a:c000:398::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08,
[1024/0]
C    *> fdff:ffff::/120 via ::, sslclient_port2, 01:33:08
C    *> fe80::/64 via ::, port2, 06:12:54

```

To test the address connections using ping:

1. On FortiGate A, ping www.bing.com using IPv4 ping:

```

# execute ping www.bing.com
PING www-bing-com.dual-a-0001.a-msedge.net (13.107.21.200): 56 data bytes
64 bytes from 13.107.21.200: icmp_seq=0 ttl=117 time=1.8 ms
...

```

2. On FortiGate B, sniff for IPv4 ICMP packets and observe the results:

```

# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
9.675101 ssl.root in 10.212.134.200 -> 13.107.21.200: icmp: echo request
9.675219 port2 out 172.16.200.9 -> 13.107.21.200: icmp: echo request
9.676698 port2 in 13.107.21.200 -> 172.16.200.9: icmp: echo reply
9.676708 ssl.root out 13.107.21.200 -> 10.212.134.200: icmp: echo reply
...

```

3. On FortiGate A, ping www.apple.com using IPv6 ping:

```

# execute ping6 www.apple.com
PING www.apple.com (2600:140a:c000:385::1aca): 56 data bytes
64 bytes from 2600:140a:c000:385::1aca: icmp_seq=1 ttl=52 time=1.88 ms
...

```

4. On FortiGate B, sniff for IPv6 ICMP packets and observe the results:

```

# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.564296 ssl.root in fdff:fff::1 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.564435 port2 out 2000:172:16:200::9 -> 2600:140a:c000:385::1aca: icmp6: echo request
seq 1

```

```

3.565929 port2 in 2600:140a:c000:385::1aca -> 2000:172:16:200::9: icmp6: echo reply seq
1 [flowlabel 0x1fdfff]
3.565953 ssl.root out 2600:140a:c000:385::1aca -> fdff:fff::1: icmp6: echo reply seq 1
[flowlabel 0x1fdfff]
...

```

Testing dual stack with web mode

In SSL VPN web mode, users can access both IPv4 and IPv6 bookmarks in the portal. The attribute, `prefer-ipv6-dns` can be enabled to prefer querying IPv6 DNS first, or disabled to prefer querying IPv4.

To test an IPv4 connection to the web portal and access www.bing.com over IPv6:

1. On FortiGate B, prioritize resolving IPv6 addresses:

```

config vpn ssl web portal
  edit "testportal1"
    set prefer-ipv6-dns enable
  next
end

```

2. Log in to the web portal in the browser over the IPv4 address 10.1.100.9.
3. Create a new HTTP/HTTPS bookmark named *bing* for the URL www.bing.com.
4. Click the *bing* bookmark. The bing page will open over IPv6.

To test an IPv6 connection to the web portal and access www.apple.com over IPv4:

1. On FortiGate B, prioritize resolving IPv4 addresses:

```

config vpn ssl web portal
  edit "testportal1"
    set prefer-ipv6-dns disable
  next
end

```

2. Log in to the web portal in the browser over the IPv6 address [2000:10:1:100::9].
3. Create a new HTTP/HTTPS bookmark named *apple* for the URL www.apple.com.

- Click the *apple* bookmark. The apple page will open over IPv4.

Disable the clipboard in SSL VPN web mode RDP connections

In web portal profiles, the clipboard can be disabled for SSL VPN web mode RDP/VNC connections. User will not be able to copy and paste content to or from the internal server.

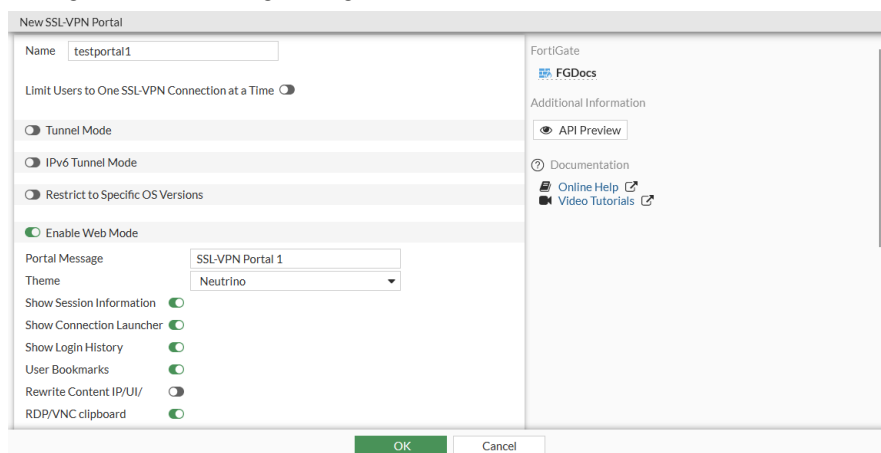

Example

In this example, two groups of users are using SSL VPN web mode to access internal servers with RDP/VNC. One group is allowed to copy and paste content to and from the internal server using the clipboard, while the other is not.

To configure the SSL VPN portals in the GUI:

- Go to **VPN > SSL-VPN Portals** and click *Create New*.
- Enter a name for the portal, such as *testportal1*.
- Enable *Enable Web Mode* and enable *RDP/VNC clipboard* to allow copying and pasting.
- Configure the remaining settings as needed.

- Click **OK**.
- Click *Create New* again.
- Enter a name for the portal, such as *testportal2*.

8. Enable *Enable Web Mode* and disable *RDP/VNC clipboard* to prevent copying and pasting.
9. Configure the remaining settings as needed.

10. Click **OK**.

To configure the SSL VPN settings in the GUI:

1. Go to **VPN > SSL-VPN Settings**.
2. Set *Listen on Interface* to port2.
3. In the *Authentication/Portal Mapping* table, add the users to each of the portals:
 - a. Click *Create New*.
 - b. Set *Users/Groups* to *u1* and *Portal* to *testportal1*.
 - c. Click **OK**, then click *Create New* again.
 - d. Set *Users/Groups* to *u2* and *Portal* to *testportal2*.
 - e. Click **OK**.
4. Configure the remaining settings as needed.

5. Click **Apply**.

To configure a firewall policy for SSL VPN in the GUI:

1. Go to **Policy & Objects > Firewall Policy** and click *Create New*.
2. Set a name for the policy, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to the SSL VPN tunnel interface and *Outgoing Interface* to port1.

4. Set *Source* to the users, *u1* and *u2*, and all addresses.
5. Set *Destination* to all addresses.
6. Set *Schedule* to *always*, *Service* to *All*, and *Action* to *Accept*.
7. Configure the remaining settings as needed.
8. Click *OK*.

To test the if the users can use the clipboard:

1. On the PC, open a web browser and log in to the web portal as user *u1*.
2. Access the internal server using RDP/VNC.

New Bookmark

Protocol type	<input type="text" value="RDP"/>
Name	<input type="text" value="RDP109"/>
Host	<input type="text" value="172.18.58.109"/>
Port	<input type="text" value="3389"/>
Description	<input type="text"/>
Use SSL-VPN credentials	<input checked="" type="checkbox"/>

Load balancing information	<input type="text"/>
Restricted admin mode	<input checked="" type="checkbox"/>

3. The clipboard is available and you can copy and paste content to and from the remote server.

4. Log out of the web portal, then log back in as user *u2* and access the internal server using RDP/VNC. The clipboard is disabled.

To configure the SSL-VPN portals and settings in the CLI:

1. Configure the SSL VPN portals:

```
config vpn ssl web portal
    edit "testportal1"
        set web-mode enable
        set clipboard enable
        ...
    next
    edit "testportal2"
        set web-mode enable
        set clipboard disable
        ...
    next
end
```

2. Configure the SSL VPN settings:

```
config vpn ssl settings
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "tunnel-access"
    config authentication-rule
        edit 1
```

```

        set users "u1"
        set portal "testportal1"
    next
    edit 2
        set users "u2"
        set portal "testportal2"
    next
end
end
end

```

3. Configure a firewall policy for SSL VPN:

```

config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end

```

4. On the PC, open a web browser, log in to the web portal as user *u1*, access the internal server using RDP/VNC, and use the clipboard.

5. Check the SSL VPN session monitor:

```

# get vpn ssl monitor
SSL-VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor	Auth			
0	u1		1(1)	N/A	10.1.100.146	0/0	0/364 0

```

SSL-VPN sessions:

```

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u1		10.1.100.146	64	0/700	RDP 172.18.58.109

6. On the PC, open a web browser, log in to the web portal as user *u2*, access the internal server using RDP/VNC, and note that the clipboard is not available.

7. Check the SSL VPN session monitor:

```

# get vpn ssl monitor
SSL-VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor	Auth			
0	u2		1(1)	N/A	10.1.100.146	0/0	0/2681 0

```

SSL-VPN sessions:

```

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u2		10.1.100.146	7	0/553	RDP 172.18.58.109

SSL VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In SSL VPN, IP addresses can be assigned from the pool in a round robin fashion, instead of the default first-available address method.

Example

In this example, two PCs connect to the VPN. SSL VPN is configured to use round robin IP address assignment. Dual stack address assignment (both IPv4 and IPv6) is used.

After a tunnel is disconnected, freeing a low IP address, the next client that connects gets the next address in the round robin instead of the lowest address.

To configure SSL VPN with round robin and dual stack:

1. Create IPv4 and IPv6 address ranges:

```
config firewall address
    edit "sslvpn_ipv4_pool"
        set type iprange
        set start-ip 173.10.1.1
        set end-ip 173.10.1.3
    next
end

config firewall address6
    edit "sslvpn_ipv6_pool"
        set type iprange
        set start-ip 2000::ad0a:101
        set end-ip 2000::ad0a:103
    next
end
```

2. Set the address ranges as IP pools in the SSL VPN settings:

```
config vpn ssl settings
    set tunnel-ip-pools "sslvpn_ipv4_pool"
    set tunnel-ipv6-pools "sslvpn_ipv6_pool"
end
```

When round-robin is used, any address pools defined in the web portal are ignored and the tunnel IPv4 and IPv6 pool addresses in the SSL VPN settings are used. Only one set of IP pool addresses can be applied.

3. Enable round-robin and dual stack in the SSL VPN settings:

```
config vpn ssl settings
    set dual-stack-mode enable
```

```

    set tunnel-addr-assigned-method round-robin
end

```

By default, the IP pool assignment follows the first available rule.

4. Create two users and assign them to an SSL VPN policy:

```

config user local
    edit "u1"
        set type password
        set passwd *****
    next
    edit "u2"
        set type password
        set passwd *****
    next
end

config firewall policy
    edit 1
        set name "sslvpnd"
        set srcintf "ssl.vdom1"
        set dstintf "link_11" "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end

```

To test the results:

1. Log in to the SSL VPN on PC1 using user u1 and then check its assigned IP address:

```

# get vpn ssl monitor
SSL-VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor	Auth			
0	u1		1 (1)	N/A	10.1.100.145	0/0	0

```

SSL-VPN sessions:

```

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u1		10.1.100.145	13	49935/35251	

173.10.1.1,2000::ad0a:101

2. Log in to the SSL VPN on PC1 using user u2 and then check its assigned IP address:

```

# get vpn ssl monitor
SSL-VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor	Auth			
0	u1		1 (1)	N/A	10.1.100.145	0/0	0
1	u2		1 (1)	N/A	10.1.100.254	0/0	0

SSL-VPN sessions:

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u1		10.1.100.145	44	90126/70405	
173.10.1.1,2000::ad0a:101						
1	u2		10.1.100.254	10	10563/8158	
173.10.1.2,2000::ad0a:102						

3. Log user u1 off of PC1, then log them back in and check that the assigned IP address is not the same as was previously assigned:

```
# get vpn ssl monitor
```

SSL-VPN Login Users:

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor	Auth			
0	u1		1 (1)	N/A	10.1.100.145	0/0	0
1	u2		1 (1)	N/A	10.1.100.254	0/0	0

SSL-VPN sessions:

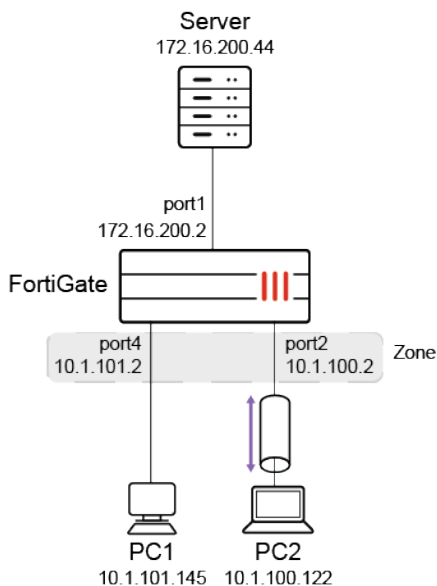

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u1		10.1.100.145	10	50992/41159	
173.10.1.3,2000::ad0a:103						
1	u2		10.1.100.254	43	30374/21860	
173.10.1.2,2000::ad0a:102						

Using SSL VPN interfaces in zones

SSL VPN interfaces can be used in zones, simplifying firewall policy configuration in some scenarios.

Example

In this example, a zone is created that includes a physical interface (port4) and an SSL VPN interface. The zone is used as the source interface in a firewall policy. PC1 is used for regular access with a firewall policy, and PC2 uses the SSL VPN for access.

To create a zone that includes the port4 and ssl.root interfaces in the GUI:

1. Go to *Network > Interfaces* and click *Create New > Zone*.
2. Set the name of the zone, such as *zone_sslvpn_and_port4*.
3. Add *port4* and *ssl.root* to the *Interface members*.

4. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Select a *Server Certificate* (*fgt_gui_automation* is used in this example).
5. Configure the remaining settings as required.

6. Click *Apply*.

To configure a firewall policy with the zone as the source interface in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set the policy name, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to *zone_sslvpn_and_port4*.
4. Set *Outgoing Interface* to *port1*.
5. Configure the remaining settings as required.

6. Click OK.

To configure the zone, SSL VPN, and policy in the CLI:

1. Create a zone that includes the port4 and ssl.root interfaces:

```
config system zone
    edit "zone_sslvpn_and_port4"
        set interface "port4" "ssl.root"
    next
end
```

2. Configure SSL VPN settings with port2 as the source interface:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-server1 8.8.8.8
    set dns-server2 8.8.4.4
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "web-access"
end
```

3. Configure a firewall policy with the zone as the source interface:

```
config firewall policy
    edit 2
        set name "policy_to_sslvpn_tunnel"
        set srcintf "zone_sslvpn_and_port4"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set users "u1"
```

next
end

To test the configuration:

1. On PC1, open a browser and try to access the server at 172.16.200.44.

You are redirected to the authentication page.

2. Enter the *Username* and *Password*, then click *Continue*.

You are redirected back to the server.

3. On PC2, access the SSL VPN web portal.

4. Enter the *Username* and *Password*, then click *Login*.

5. Access the server using the bookmark.

SSL VPN troubleshooting

The following topics provide information about SSL VPN troubleshooting:

- [Debug commands on page 2217](#)
- [Troubleshooting common issues on page 2217](#)

Debug commands

SSL VPN debug command

Use the following diagnose commands to identify SSL VPN issues. These commands enable debugging of SSL VPN with a debug level of -1 for detailed results.

```
diagnose debug application sslvpn -1
diagnose debug enable
```

The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

To disable the debug:

```
diagnose debug disable
diagnose debug reset
```

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

```
diagnose debug application fnbamd -1
diagnose debug reset
```

Troubleshooting common issues

To troubleshoot getting no response from the SSL VPN URL:

1. Go to *VPN > SSL-VPN Settings*.
 - a. Confirm that SSL VPN is enabled.
 - b. Check the SSL VPN port assignment.
 - c. Check the *Restrict Access* setting to ensure the host you are connecting from is allowed.
2. Go to *Policy > Firewall Policy*.
 - a. Check that the policy for SSL VPN traffic is configured correctly.
 - b. Check the URL you are attempting to connect to. It should follow this pattern:

```
https://<FortiGate IP>:<Port>
```

- c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.

```
ping <FortiGate IP>
```

- d. Check the browser has *TLS 1.1*, *TLS 1.2*, and *TLS 1.3* enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the FortiClient version is compatible with your version of FortiOS.
2. FortiClient uses IE security setting, In IE *Internet options* > *Advanced* > *Security*, check that *Use TLS 1.1* and *Use TLS 1.2* are enabled.
3. Check that SSL VPN *ip-pools* has free IPs to sign out. The default *ip-poolsSSLVPN_TUNNEL_ADDR1* has 10 IP addresses.
4. Export and check FortiClient debug logs.
 - a. Go to *File* > *Settings*.
 - b. In the *Logging* section, enable *Export logs*.
 - c. Set the *Log Level* to *Debug* and select *Clear logs*.
 - d. Try to connect to the VPN.
 - e. When you get a connection error, select *Export logs*.

To troubleshoot SSL VPN hanging or disconnecting at 98%:

1. A new SSL VPN driver was added to FortiClient 5.6.0 and later to resolve SSL VPN connection issues. If your FortiOS version is compatible, upgrade to use one of these versions.
2. Latency or poor network connectivity can cause the login timeout on the FortiGate. In FortiOS 5.6.0 and later, use the following commands to allow a user to increase the SSL VPN login timeout setting.

```
config vpn ssl settings
  set login-timeout 180 (default is 30)
  set dtls-hello-timeout 60 (default is 10)
end
```

To troubleshoot tunnel mode connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

```
config system interface
  edit <name>
    set preserve-session-route enable
  next
end
```

If you are using a FortiOS 6.0.0 or earlier:

```
config vpn ssl settings
  set route-source-interface enable
end
```

To troubleshoot users being assigned to the wrong IP range:

1. Go to *VPN* > *SSL-VPN Portals* and *VPN* > *SSL-VPN Settings* and ensure the same *IP Pool* is used in both places. Using the same *IP Pool* prevents conflicts. If there is a conflict, the portal settings are used.

To troubleshoot slow SSL VPN throughput:

Many factors can contribute to slow throughput.

This recommendation tries to improve throughput by using the FortiOS Datagram Transport Layer Security (DTLS) tunnel option, available in FortiOS 5.4 and above.

DTLS allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

To use DTLS with FortiClient:

1. Go to *File > Settings* and enable *Preferred DTLS Tunnel*.

To enable DTLS tunnel on FortiGate, use the following CLI commands:

```
config vpn ssl settings
    set dtls-tunnel enable
end
```

User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 2242](#) and [Configuring client certificate authentication on the LDAP server on page 2256](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

To secure RADIUS connections, consider using RADSEC over TLS instead. See [Configuring a RADSEC client on page 2291](#).

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- [Endpoint control and compliance on page 2221](#)
- [User definition and groups on page 2229](#)
- [LDAP servers on page 2242](#)
- [RADIUS servers on page 2258](#)
- [TACACS+ servers on page 2295](#)
- [SAML on page 2296](#)
- [Authentication settings on page 2323](#)
- [FortiTokens on page 2325](#)
- [PKI on page 2352](#)
- [Configuring the maximum log in attempts and lockout period on page 2352](#)
- [Configuring firewall authentication on page 2360](#)
- [FSSO on page 2366](#)
- [Authentication policy extensions on page 2376](#)
- [Configuring the FortiGate to act as an 802.1X supplicant on page 2377](#)
- [Include usernames in logs on page 2379](#)

Endpoint control and compliance

The section contains the following topics:

- [Per-policy disclaimer messages on page 2221](#)
- [Compliance on page 2223](#)
- [FortiGuard distribution of updated Apple certificates on page 2225](#)
- [Integrate user information from EMS and Exchange connectors in the user store on page 2226](#)

Per-policy disclaimer messages

FortiOS supports a customizable captive portal to direct users to install or enable required software.

Per-policy custom disclaimers in each VDOM are supported. For example, you may want to configure three firewall policies, each of which matches traffic from endpoints with different FortiClient statuses:

Endpoint status	FortiOS behavior
Endpoint does not have FortiClient installed.	Traffic matches a firewall policy that displays an in-browser warning to install FortiClient from the provided link.
Endpoint has FortiClient installed, registered to EMS, and connected to the FortiGate.	Traffic matches a dynamic firewall policy which allows the endpoint to reach its destination via this policy.
Endpoint is deregistered from EMS and disconnected from the FortiGate.	Traffic matches another dynamic firewall policy that displays warning to register FortiClient to EMS.

The [replacement message groups](#) and policy disclaimer settings must be enabled.

To enable per-policy disclaimer messages in the GUI:

1. Go to *System > Feature Visibility*.
2. Enable *Replacement Message Groups* and *Policy Disclaimer*.
3. Click *Apply*.

To enable per-policy disclaimer messages in the CLI:

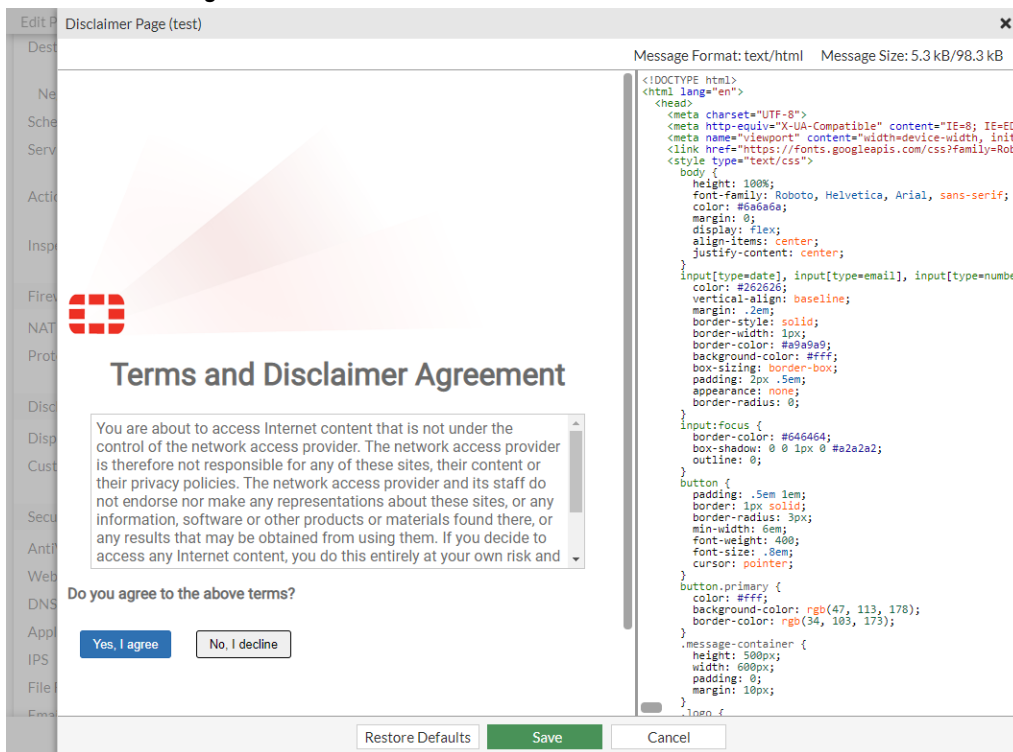

```
config system global
    set gui-replacement-message-groups enable
end

config system settings
    set gui-policy-disclaimer enable
end
```

To configure per-policy disclaimers in the GUI:

1. Ensure the per-policy disclaimer messages option is enabled.
2. Go to *Policy & Objects > Firewall Policy*.
3. Edit the policy that applies when an endpoint does not have FortiClient installed.
4. Under *Disclaimer Options*, enable *Display Disclaimer* and *Customize Messages*.

5. Add a replacement message group:
 - a. Select an existing replacement message group from the dropdown and click *Edit Disclaimer Message*.
 - b. Click *Create*, enter a name, and click *OK*. Select the replacement message group and click *Edit Disclaimer Message*.

6. Edit the message to warn users to install FortiClient, and provide the FortiClient download link.
7. Click *Save*.
8. Repeat the above steps for each policy that requires a custom disclaimer message.

To configure per-policy disclaimers in the CLI:

```
config firewall policy
  edit 1
    set name "111"
    set srcintf "port12"
    set dstintf "port11"
    set srcaddr "all"
    set dstaddr "pc155_address"
    set action accept
    set schedule "always"
    set service "ALL"
    set wso disable
    set groups "ems_03_group"
    set disclaimer enable
    set replacemsg-override-group "test"
    set nat enable
  next
  edit 4
    set name "44"
    set srcintf "port12"
```

```
set dstintf "port11"
set srcaddr "all"
set dstaddr "pc5-address"
set action accept
set schedule "always"
set service "ALL"
set wso disable
set groups "ems_03_group"
set disclaimer enable
set replacemsg-override-group "test2"
set nat enable
next
edit 6
set name "66"
set srcintf "port12"
set dstintf "port11"
set srcaddr "all"
set dstaddr "all"
set status disable
set schedule "always"
set service "ALL"
set logtraffic all
set fsso disable
set block-notification enable
set replacemsg-override-group "endpoint-override"
next
end
```

Compliance

The following topics provide information about compliance in FortiOS.

- [FortiGate VM unique certificate on page 2223](#)
- [Running a file system check automatically on page 2224](#)

FortiGate VM unique certificate

To safeguard against certificate compromise, FortiGate VM and FortiAnalyzer VM use the same deployment model as FortiManager VM where the license file contains a unique certificate tied to the serial number of the virtual device.

A hardware appliance usually comes with a BIOS certificate with a unique serial number that identifies the hardware appliance. This built-in BIOS certificate is different from a firmware certificate. A firmware certificate is distributed in all appliances with the same firmware version.

Using a BIOS certificate with a built-in serial number provides a high trust level for the other side in X.509 authentication.

Since a VM appliance has no BIOS certificate, a signed VM license can provide an equivalent of a BIOS certificate. The VM license assigns a serial number in the BIOS equivalent certificate. This gives the certificate an abstract access ability, which is similar to a BIOS certificate with the same high trust level.

This feature is only supported in new, registered VM licenses.

Sample configurations

Depending on the firmware version and VM license, the common name (CN) on the certificate will be configured differently.

License	Firmware			
	6.0	6.2	6.4	7.0
6.0	CN = FortiGate	CN = FortiGate	CN = FortiGate	CN = FortiGate
6.2	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number
6.4	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number
7.0	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number

To view validated certificates:

1. Go to *System > Certificates*.
2. Double-click on a VM certificate. There are two VM certificates:
 - *Fortinet_Factory*
 - *Fortinet_Factory_Backup*
 The *Certificate Detail Information* window displays.

Running a file system check automatically

There is an option in FortiOS to enable automatic file system checks if the FortiGate shuts down ungracefully.

By default, the automatic file system check is disabled. When an administrator logs in after an ungraceful shutdown, a warning message appears advising them to manually run a file system check. A warning also appears in the CLI:

```
WARNING: File System Check Recommended! Unsafe reboot may have caused inconsistency in disk
drive.
It is strongly recommended that you check file system consistency before proceeding.
Please run 'execute disk scan 17'
Note: The device will reboot and scan during startup. This may take up to an hour
```

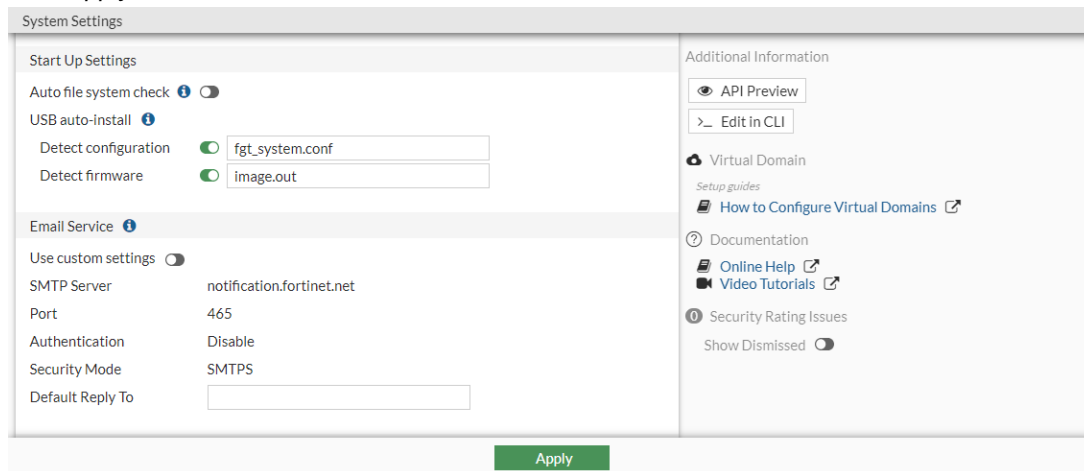

Enabling automatic file system checks

You can enable automatic file system checks in both the GUI and CLI.

To enable automatic file system checks in the GUI:

1. Go to *System > Settings*.
2. In the *Start Up Settings* section, enable *Auto file system check*.

3. Click *Apply*.

To enable automatic file system checks using the CLI:

```
config system global
    set autorun-log-fsck enable
end
```

FortiGuard distribution of updated Apple certificates

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

```
/data/etc/apns # ls -al
drwxr-xr-x  2 0      0      Tue Jan 15 08:42:39 2019    1024 .
drwxr-xr-x 12 0      0      Tue Jan 15 08:45:00 2019    2048 ..
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019    2377 apn-dev-cert.pem
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019    1859 apn-dev-key.pem
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019    8964 apn-dis-cert.pem
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019    4482 apn-dis-key.pem
```

2. Rename all current Apple certificates.

Apple push notification no longer works after you rename the certificates.

```
/data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
/data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
/data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
/data/etc/apns # mv apn-dis-key.pem apn-dis-key.pem.save
/data/etc/apns # ls -al
```

```

drwxr-xr-x  2 0 0  Tue Jan 15 08:51:15 2019  1024 .
drwxr-xr-x 12 0 0  Tue Jan 15 08:45:00 2019  2048 ..
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  2377 apn-dev-cert.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  1859 apn-dev-key.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  8964 apn-dis-cert.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  4482 apn-dis-key.pem.save

```

3. Run a FortiGuard update, and verify that all certificates are installed again:

```

/data/etc/apns # ls -al
drwxr-xr-x  2 0 0  Tue Jan 15 08:56:20 2019  1024 .
drwxr-xr-x 12 0 0  Tue Jan 15 08:56:15 2019  2048 ..
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  2377 apn-dev-cert.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  1859 apn-dev-key.pem.save
-rw-r--r--  1 0 0  Tue Jan 15 08:56:20 2019  2167 apn-dis-cert.pem <-- downloaded
from FortiGuard
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  8964 apn-dis-cert.pem.save
-rw-r--r--  1 0 0  Tue Jan 15 08:56:20 2019  1704 apn-dis-key.pem <-- downloaded
from FortiGuard
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  4482 apn-dis-key.pem.save
-rw-r--r--  1 0 0  Tue Jan 15 08:56:20 2019    41 apn-version.dat <-- downloaded
from FortiGuard
/data/etc/apns #

```

Integrate user information from EMS and Exchange connectors in the user store

When a FortiClient endpoint is managed by EMS, logged in user and domain information is shared with FortiOS through the EMS connector. This information can be joined with the Exchange connector to produce more complete user information in the user store.

The `diagnose user-device-store device memory list` command displays detailed device information.

Sample topology

In this example, the FortiClient PC user (test1) logs on to the AD domain (FORTINET-FSSO.COM), which is also the same domain as the Exchange server. The user information is pushed to the EMS server that the user is registered to. The FortiGate synchronizes the information from EMS, and at the same time looks up the user on the Exchange server under the Exchange connector. If the user exists on the Exchange server, additional information is fetched. These details are combined in the user store, which is visible in the *FortiClient* widget in the *Status* dashboard.

To configure the Exchange server:

```
config user exchange
  edit "exchange-140"
    set server-name "W2K8-SERV1"
    set domain-name "FORTINET-FSSO.COM"
    set username "Administrator"
    set password *****
  next
end
```

To configure the EMS server:

```
config endpoint-control fctems
  edit "ems133"
    set server "172.18.62.12"

```

User definition and groups

FortiGate authentication controls system access by user groups. By assigning individual users to the appropriate user groups, this controls each user's access to network resources. The user groups members are user accounts, of which there are several types. Local and peer users are defined in FortiOS. User accounts can also be defined on remote authentication servers.

This section contains information about configuring the following:

- [Users on page 2229](#)
- [User groups on page 2231](#)
- [Retail environment guest access on page 2238](#)
- [User and user group timeouts on page 2241](#)

For information about configuring authentication servers, see the [LDAP servers on page 2242](#), [RADIUS servers on page 2258](#), [TACACS+ servers on page 2295](#), and [SAML on page 2296](#) sections.

Users

A user is a user account consisting of a username, password, and sometimes other information, that is configured in FortiOS or on an external authentication server. There are several types of user accounts with slightly different methods of authentication.

User type	Authentication method
Local	The username and password must match a user account stored in FortiOS. Authentication is done by a firewall policy.
Remote	Remote users consist of usernames defined in FortiOS that are authenticated by a remote server. For example, RADIUS, TACACS+, LDAP, or FortiNAC. The server must be configured in FortiOS before creating a user.
FSSO	Users on a Microsoft Windows, Citrix, or Novell network can use their network authentication to access resources through the FortiGate. Access is controlled through FSSO user groups, which contain Windows, Citrix, or Novell user groups as members. The FSSO agent must be configured in FortiOS before creating a user (see FSSO on page 2366).
PKI or peer	A PKI or peer user is a digital certificate holder that authenticates using a client certificate. No password is required, unless two-factor authentication is enabled. In the GUI, the <i>User & Authentication > PKI</i> menu is only available after a PKI user is configured in the CLI (see Configuring a PKI user on page 2352).

Some user types have an option to enable multi-factor authentication using FortiToken or FortiToken Cloud. In some cases, the user must be defined first, and then can be edited to add multi-factor authentication. See [FortiTokens on page 2325](#) for more information.

To create a user:

1. Go to User Authentication > User Definition and click Create New. The *Users/Groups Creation Wizard* appears.
2. Select a *User Type* and click *Next*.

3. The remaining wizard steps depend on the user type:

- **Local User:**

- Enter a *Username* and *Password*, then click *Next*.
- Optionally, enable *Two-factor Authentication* and configure the following:

Authentication Type	Select <i>FortiToken Cloud</i> or <i>FortiToken</i> .
Token	If using FortiToken to authenticate, select a token.
Email Address	Enter an email address.
SMS	Enable to send an SMS message to activate the token.
Country Dial Code	Select the country code.
Phone Number	Enter a phone number.

- Click *Next*, then click *Submit*.

- **Remote LDAP User:**

- Select an *LDAP Server*, then click *Next*.
- Select the users to add from the LDAP server. If the user ID matches an existing configured username, it cannot be added.

- Click *Submit*.

- **Remote RADIUS User and Remote TACACS+ User:**

- Enter a *Username* and select the server.
- Click *Next*.
- Optionally, enable *Two-factor Authentication* and configure the settings as needed.
- Click *Next*, then click *Submit*.

- *FSSO*:
 - i. Select an *FSSO Agent*, click the + to add *AD Groups*, then click *Next*.
 - ii. Select an FSSO group to add the *AD Groups* to. If an FSSO group already exists (see [Configuring FSSO user groups on page 2235](#)), click *Choose Existing* and select the group. Otherwise, click *Create New*, enter a name, and click *OK*.
 - iii. Click *Submit*.

User groups

A user group is a list of user identities. A user identity can be a:

- Local user account (username/password) stored on the FortiGate
- Remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- PKI user account with a digital client authentication certificate stored on the FortiGate
- RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- User group defined on an FSSO server

User groups provide the ability to combine users that require the same permissions so they can be referenced at once, which enables consistency in configurations. User groups allow for remote servers to be referenced by leveraging the pre-existing user accounts, instead of redefining them on the FortiGate.

For example, when a new employee joins a department, they can be added to their respective group, whether in the remote authentication server or local group, and be subject to the same access as their colleagues in the same department. In FortiOS, user groups can be used when configuring firewall policies, traffic shaping policies, proxy policies, SSL VPN portals, IPsec VPN XAUTH, ZTNA, wireless networks (SSIDs), web filtering profiles, identity-based routing, and system administrators with remote authentication.

In most cases, the FortiGate authenticates users by requesting their username and password. The FortiGate checks local user accounts first. If a match is not found, the FortiGate checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will also be matched.

Four types of user groups can be configured:

- [Firewall](#)
- [FSSO](#)
- [RSSO](#)
- [Guest](#)

Configuring firewall user groups

Firewall user groups are used locally as part of authentication. For example, when a firewall policy allows access only to specified user groups, users must authenticate before matching the policy. If the user authenticates successfully and is a member of one of the permitted groups, the policy is applied to the user. A firewall user group may contain local users (defined locally or authenticated remotely), PKI users, or authentication servers.

There are two options to add users in a firewall group configuration: members or remote groups. Members are the individual users who have been defined in FortiOS. Remote groups are remote server that users may authenticate to. One or more user groups can be specified within that server to limit which users can authenticate to the firewall user group. Both options may be used at the same time. The FortiGate attempts to authenticate users in the members list first, and then the remote groups if the initial authentication does not succeed.

When adding remote groups to user groups, FortiTokens cannot be applied to the users. To use remote authentication servers and FortiToken for multi-factor authentication, a remote user type must be created and then added as a user group member.

The following user group configuration examples have local members and a remote authentication server user group. There are two LDAP users, but the principle applies to other remote authentication server types.

Both LDAP users (shudson and tflenderson) belong to the primary group, Domain Users. The user, shudson belongs to the Sales group; tflenderson belongs to the HR group.

Example 1: Adding multiple remote groups to a user group

In this example, two remote groups (HR and Sales) are added to a firewall group called SSL_VPN_ACCESS.

To add multiple remote groups to a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *Sales*, then right-click and select *Add Selected*.

6. Select *HR*, then right-click and select *Add Selected*.

7. Click *OK*.

Both user group paths are specified under the *Group Name*.

8. Click *OK*.

In this configuration, shudson and tflenderson would be able to authenticate to this group.

Example 2: combining remote groups and local users in a user group

In this example, the firewall group (SSL_VPN_ACCESS) is configured to contain the HR remote group and a local LDAP user (shudson) with multi-factor authentication.

+ Create New Edit Clone Delete <input type="text" value="Search"/>					
Name	Type	Two-factor Authentication	Groups	Status	Ref.
shudson	LDAP	FTKMOB		Enabled	0
Administrator	LDAP			Enabled	0
Guest	LDAP			Enabled	1
Mandrews	LDAP			Enabled	0

To combine remote groups and local users in a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups* Section, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *HR*, then right-click and select *Add Selected*.
6. Click *OK*.
7. In the *Members* field, click the + and add *shudson*.

8. Click *OK*.
In this configuration, shudson, tflenderson, and any members of the HR LDAP group would be able to authenticate to the user group. Other users in the Sales group are not allowed.

Example 3: adding a user as a member and their group as a remote groups

This example uses a combination of the previous examples. The HR and Sales groups are added as remote groups similar to example 1. The local LDAP user, shudson (using a FortiToken), from example 2 is added as a group member.

This example is for demonstration only. It may cause unwanted results, so this configuration is not advised.

To add a user as a member and their group as a remote groups:

1. Refer to [example 1](#) to configure the two remote groups.
2. In the *Members* field, click the + and add *shudson*.

3. Click *OK*.

One unwanted scenario from this configuration is that a user might be able to bypass multi-factor authentication on LDAP by changing the username case (see the related [PSIRT](#) advisory). By default, the username of the remote LDAP user is case sensitive. This means the username has to match what is configured (*shudson*). If a user types *sHudson*, for example, this will not match the user *shudson*, so it falls through to remote group authentication. It will match the Sales group in this example. To prevent this, disable username case sensitivity (see [SSL VPN for remote users with MFA and user sensitivity on page 2104](#) for more details).

To disable case sensitivity on the remote user:

```
config user local
  edit <name>
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTKMOBxxxxxxxxxxx"
    set email-to <email_address>
    set username-sensitivity disable
    set ldap-server <server_name>
  next
end
```

There is another unwanted scenario from this configuration than can occur to bypass multi-factor authentication. The LDAP server, *ldap*, has a user named *shudson*. Another LDAP server, *ldap2*, also has a user named *shudson*, but with a different password. If the *ldap* and *ldap2* servers are added to the user group in addition to the remote *shudson* user, if a user tries to log in using *shudson* and the password on the *ldap2* server, they would be able to bypass multi-factor authentication.

Configuring FSSO user groups

FSSO user groups contain only Windows, Citrix, and Novell network users. Information about these user groups and their member logon activities are provided by the corresponding FSSO connector. See the [FSSO on page 2366](#) section for more information.

Configuring RSSO user groups

RADIUS single sign-on user groups leverage a RADIUS server to authenticate connecting users. This requires users to log in to their computer using their RADIUS account. The FortiGate does not interact with the remote RADIUS server. It only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. See [RADIUS single sign-on agent on page 3092](#) for more information.

Configuring guest user groups

In some scenarios, an administrator might need to create temporary user accounts with a defined expiry time to access network resources. For example, if there is a large conference and many attendees require temporary network access for a few days. *Guest Management* can be used to combine many guest users into a group. Many guest accounts can be created at once using randomly-generated user IDs and passwords.

A guest group must be configured first. The guest user account user ID can be an email address, a randomly generated string, or an ID that is assigned by the administrator. The password can be assigned by the administrator or randomly generated. The guest group configuration determines the fields that are provided when creating guest user accounts in *Guest Management*.

To create a guest user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name, and set the *Type* to *Guest*.

3. Configure the following:

Batch Guest Account Creation	Create multiple accounts automatically. When enabled: <ul style="list-style-type: none"> The user ID and password are automatically generated. The accounts only have user ID, password, and expiration fields. The expiration field is editable in the GUI in the <i>Start Countdown</i> and <i>Time</i> settings. An administrator can print the account information. Users do not receive an email or SMS notification.
User ID	Select one of the following: <ul style="list-style-type: none"> <i>Email</i>: use the user's email address <i>Auto Generate</i>: FortiOS creates a random user ID <i>Specify</i>: the administrator assigns a user ID
Maximum Accounts	Enable to set a maximum number of guest accounts that can be created for this group (disabled = unlimited).
Guest Details	
Enable Name	If enabled, the user form has a field to enter a name.
Enable Email	If enabled, the user is notified by email.
Enable SMS	If enabled, the user is notified by SMS.
Password	Select one of the following: <ul style="list-style-type: none"> <i>Auto Generate</i>: FortiOS creates a random password <i>Specify</i>: the administrator assigns a password If the setting is disabled, no password is used.
Sponsor	If enabled, the user form has a field to enter a sponsor (<i>Optional</i>). Select <i>Required</i> if the sponsor field is mandatory.
Company	If enabled, the user form has a field to enter a company (<i>Optional</i>). Select <i>Required</i> if the company field is mandatory.
Expiration	
Start Countdown	Select one of the following: <ul style="list-style-type: none"> <i>On Account Creation</i>: the countdown starts from the time the account is created <i>After First Login</i>: the countdown starts from the time the first time the user logs in
Time	Set the expiry time. There are fields to enter values for <i>Days</i> , <i>Hours</i> , <i>Minutes</i> , and <i>Seconds</i> .

4. Click OK.

To manually create a guest user account:

1. Go to *User & User & Authentication > Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box.

3. Click *Create New* and enter the information in the *Create User* pane. The fields are based on the guest group configuration. Optional fields can be left blank, such as *Sponsor* in this example.

4. Click *OK*.

To automatically create multiple guest user accounts:

1. Go to *User & User & Authentication > Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box. The group must have *Batch Guest Account Creation* enabled.
3. Click *Create New > Multiple Users* and enter the *Number of Accounts*.
4. Optionally, edit the *Expiration* date and time.

5. Click *OK*.

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a firewall policy to grant network access only to users who provide a valid email address. The first time a customer's device

attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:

1. [Creating an email collection portal on page 2239](#)
2. [Creating a firewall policy on page 2239](#)
3. [Checking for collected emails on page 2240](#)

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the collected emails device group.

This example modifies the freewifi WiFi interface to present an email collection captive portal.

To configure the freewifi SSID to use an email collection portal in the GUI:

1. Enable email collection:
 - a. Go to *System > Feature Visibility*.
 - b. In the *Additional Features* section, enable *Email Collection*.
 - c. Click *Apply*.
2. Edit the freewifi SSID:
 - a. Go to *WiFi & Switch Controller > SSIDs* and edit the *freewifi* SSID.
 - b. In the *Security Mode Settings* section, set the *Security mode* to *Captive Portal*.
 - c. Set the *Portal type* to *Email Collection*.
 - d. Click *OK*.

To configure the freewifi SSID to use an email collection portal in the CLI:

```
config wireless-controller vap
    edit freewifi
        set security captive-portal
        set portal-type email-collect
    next
end
```

Creating a firewall policy

You must configure a firewall policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the collected emails device group. This policy must be listed first. Unknown devices are not members of the collected emails device group, so they do not match the policy.

To create a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "freewifi"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
```

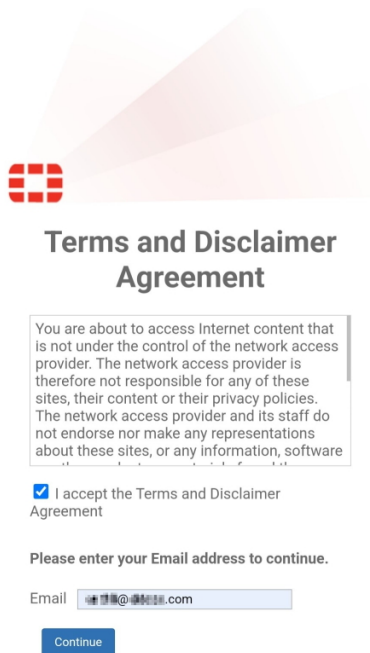

```

        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set email-collect enable
    next
end

```

Checking for collected emails

When a WiFi user connects to the freewifi SSID, they are presented with a captive portal to enter their email address.

Once the user enters their email and clicks *Continue*, they will have access to the Internet. The collected emails can be verified in FortiOS.

To check for collected emails in the GUI:

1. Go to *Dashboard > Assets & Identities* and click *Add Widget*.
2. In the *User & Authentication* section, select *Collected Email* and click *Add Widget*.
3. Click *Close*.
4. Click the *Collected Email* to expand to full view. The list of emails is displayed.

[+ Add Widget](#)

Collected Email	Duration	IP Address	Traffic Volume	Time Left
example@example.com	14m 30s		5.12 MB <div><div></div></div>	9d 23h

Updated: 16:24:39

5. Optionally, click *Export* to export the data as a CSV or JSON file.

To check for collected emails in the CLI:

```
# diagnose firewall auth mac list

72:4d:e1:**:**:**, admin@fortinet.com
    type: email, id: 0, duration: 937, idled: 19
    expire: 863980, allow-idle: 864000
    flag(1000): src_idle
    packets: in 4753 out 4592, bytes: in 2662403 out 2458644

----- 1 listed, 0 filtered -----
```

User and user group timeouts

Authenticated user groups can have timeout values per group in addition to FortiGate-wide timeouts. Three types of group timeouts can be configured: idle, hard, and session. These are in addition to any external timeouts, such as those on RADIUS servers.

To configure the timeout type for authenticated users:

```
config user setting
    set auth-timeout-type {idle-timeout | hard-timeout | new-session}
    set auth-timeout <integer>
end
```

Timeouts are measured in minutes (1 - 1440, default = 5). If VDOMs are enabled, the global level `auth-timeout user` setting is the default all VDOMs inherit.

Timeout type	Description
Idle	This is the default setting. The idle timer starts when a user initiates a session. As long as data is transferred in this session, the timer continually resets. If the data flow stops, the timer is allowed to advance until it reaches its limit. When the user has been idle for too long, the user must re-authenticate before traffic is allowed to continue in that session.
Hard	The hard timer starts when a user initiates a session. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any events.
Session	The session timer starts when a user initiates a session. When the timeout is reached, existing sessions may continue. New sessions are not allowed until the user re-authenticates. This timeout is not affected by any events.

To configure the authentication timeout for a user group:

```
config user group
    edit <name>
        set authtimeout <integer>
    next
end
```

Timeouts are measured in minutes (0 - 43200). A value of zero (the default) means the global timeout is used.

If a user belongs to multiple RADIUS groups, the group `authtimeout` values are ignored. The global `auth-timeout` value is used instead (under `config user setting`).

LDAP servers

The following topics provide information about LDAP servers:

- [Configuring an LDAP server on page 2242](#)
- [Enabling Active Directory recursive search on page 2245](#)
- [Configuring LDAP dial-in using a member attribute on page 2246](#)
- [Configuring wildcard admin accounts on page 2247](#)
- [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#)
- [Tracking users in each Active Directory LDAP group on page 2250](#)
- [Tracking rolling historical records of LDAP user logins on page 2253](#)
- [Configuring client certificate authentication on the LDAP server on page 2256](#)

Configuring an LDAP server

FortiOS can be configured to use an LDAP server for authentication.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See relevant LDAPS information in this topic and [Configuring client certificate authentication on the LDAP server on page 2256](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

To configure an LDAP server on the FortiGate:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	This connection name is for reference within the FortiGate only.
Server IP/Name	LDAP server IP address or FQDN resolvable by the FortiGate.
Server Port	By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.

Common Name Identifier	<p>Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are:</p> <ul style="list-style-type: none"> • <i>cn</i> (Common Name) • <i>sAMAccountName</i> (SAMAccountName) • <i>uid</i> (User ID)
Distinguished Name	<p>Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup.</p> <p>Enter <i>dc=COMPANY,dc=com</i> to specify the root of the domain to include all objects.</p> <p>Enter <i>ou=VPN-Users,dc=COMPANY,dc=com</i> to look up users under a specific organization unit.</p>
Exchange server	<p>Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 3095 for more details.</p>
Bind Type	<p>Select one of the following options:</p> <ul style="list-style-type: none"> • <i>Simple</i>: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree. • <i>Anonymous</i>: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this. • <i>Regular</i>: bind using the username and password provided, and search starting from the DN and recurse over the subtrees.
Username	<p>If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported:</p> <ul style="list-style-type: none"> • <i>username\administrator</i> • <i>administrator@domain</i> • <i>cn=administrator,cn=users,dc=domain,dc=com</i>
Password	<p>If using regular bind, enter the password associated with the username.</p>
Secure Connection	<p>Enable to apply security to the LDAP connection through STARTTLS or LDAPS.</p>
Protocol	<p>If <i>Secure Connection</i> is enabled, select <i>STARTTLS</i> or <i>LDAPS</i>. Selecting <i>STARTTLS</i> changes the port to 389 and selecting <i>LDAPS</i> changes the port to 636.</p>
Certificate	<p>Enable and select the certificate so the FortiGate will only accept a certificate from the LDAP server that is signed by this CA.</p>
Server identity check	<p>Enable to verify the server domain or IP address against the server certificate. This option is enabled by default and it is recommended to leave it enabled for a secure configuration.</p>

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the *Server IP/Name* field with the following logic:

- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

4. Optionally, click *Test User Credentials* to ensure that the account has sufficient access rights.
5. Click *OK*.
The FortiGate checks the connection and updates the *Connection Status*.

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	LDAP-fortiad
Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the <i>Username</i> and <i>Password</i> for LDAP binding and lookup.
Secure Connection	Enabled <ul style="list-style-type: none"> • Set <i>Protocol</i> to <i>LDAPS</i>. • Enable <i>Certificate</i> and select the CA certificate to validate the server certificate.
Server identity check	Optionally, enable to verify the domain name or IP address against the server certificate.

4. Click *Test Connectivity* to verify the connection to the server.
5. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
  edit "LDAP-fortiad"
    set server "10.88.0.1"
    set cnid "sAMAccountName"
    set dn "dc=fortiad,dc=info"
    set type regular
    set username "fortiad\Administrator"
    set password <password>
    set secure ldaps
    set ca-cert "CA_Cert_1"
    set port 636
  next
end
```

Enabling Active Directory recursive search

By default, nested groups (groups that are members of other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```
config user ldap
  edit "ldap-ad"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
```

```
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                        CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
```

To enable recursive search to include nested groups in the results:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
        set search-type recursive
    next
end
```

The search results now include groups that have other groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                        CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
                        CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                        CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

The group nested3 is a member of the group nested2, which is a member of the group nested1.

Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to *TRUE*, instead of their user group. You can activate the *Allow Dialin* property in AD user properties, which sets the *msNPAllowDialin* attribute to *TRUE*. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the *msNPAllowDialin* attribute set to *TRUE* for the desired users.
2. [Configure user LDAP member attribute settings.](#)
3. [Configure LDAP group settings.](#)
4. [Ensure that you configured the settings correctly.](#)

To configure user LDAP member attribute settings:

```
config user ldap
    edit "ldap_server"
        set server "192.168.201.3"
        set cnid "sAMAccountName"
```

```
set dn "DC=fortilabanz,DC=com,DC=au"
set type regular
set username "fortigate@sample.com"
set password *****
set member-attr "msNPAllowDialin"
next
end
```

To configure LDAP group settings:

```
config user group
edit "ldap_grp"
set member "ldap_server"
config match
edit 1
set server-name "ldap_server"
set group-name "TRUE"
next
end
next
end
```

To ensure that you configured the settings correctly:

Users that are members of the `ldap_grp` user group should be able to authenticate. The following shows sample diagnose debug output when the Allow Dial-in attribute is set to TRUE:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to TRUE but is expected, you may see the following output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The difference between the two outputs is the last line, which shows passed or failed depending on whether the member attribute is set to the expected value.

Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote admin account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials. To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 2242](#) and [Configuring client certificate authentication on the LDAP server on page 2256](#).

To secure RADIUS connections, consider using RADSEC over TLS. See [Configuring a RADSEC client on page 2291](#).

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 2249](#).

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
    set cnid "sAMAccountName"
    set dn "DC=example,DC=com,DC=au"
    set type regular
    set username "CN=Administrator,CN=Users,DC=example,DC=COM"
    set password *
    set group-member-check group-object
    set group-object-filter (&
      (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM")
  next
end
```

To configure the user group and add the LDAP server:

```
config user group
  edit "ldap_grp"
    set member "ldap_server"
    config match
      edit 1
        set server-name "ldap_server"
        set group-name "CN=GRP,OU=training,DC=example,DC=COM"
      next
    end
  next
end
end
end
end
```

To configure the wildcard admin account:

```
config system admin
  edit "test"
    set remote-auth enable
    set accprofile "super_admin"
    set wildcard enable
    set remote-group "ldap_grp"
  next
end
```

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the [product documentation](#).

To configure account privileges for LDAP authentication in Active Directory:

1. In the *Active Directory Users and Computers* administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select *Delegate Control*.
2. In the *Delegation of Control Wizard* dialog, click *Next*.
3. In the *Users or Groups* dialog, click *Add...* and search Active Directory for the users or groups.
4. Click *OK* and then click *Next*.
5. In the *Tasks to Delegate* dialog, select *Create a custom task to delegate* and click *Next*.
6. Select *Only the following objects in the folder* and scroll to the bottom of the list. Select *User objects* and click *Next*.
7. In the *Permissions* dialog, select *General*.
8. From the *Permissions* list, select the following:
 - *Change password*
 - *Reset password*
9. Clear the *General* checkbox and select *Property-specific*.

10. From the *Permissions* list, select the following:

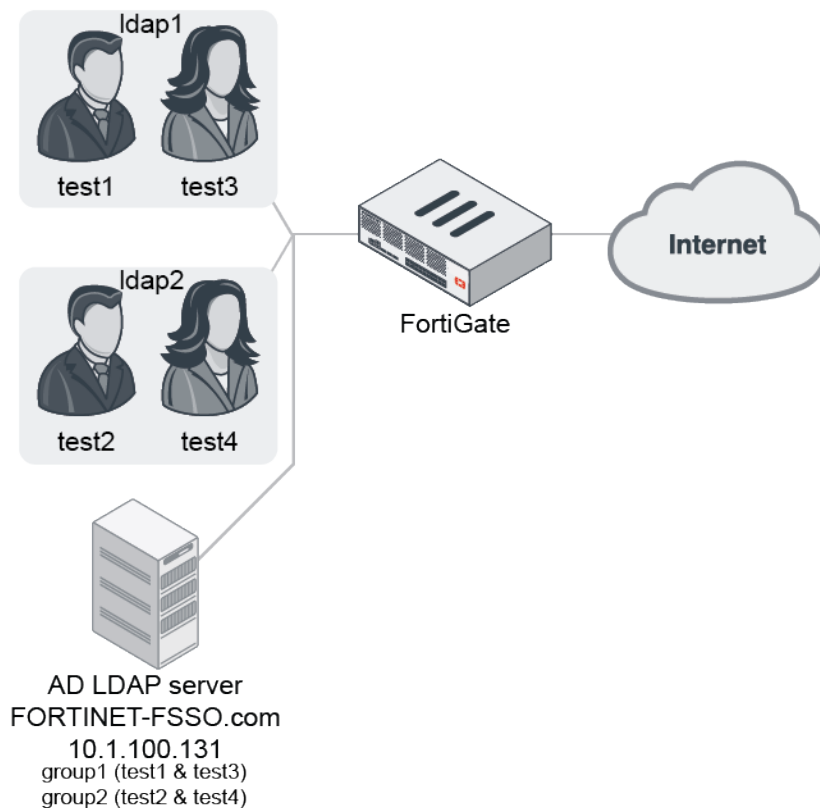

- *Write lockoutTime*
- *Read lockoutTime*
- *Write pwdLastSet*
- *Read pwdLastSet*
- *Write UserAccountControl*
- *Read UserAccountControl*

11. Click *Next* and click *Finish*.

Tracking users in each Active Directory LDAP group

When LDAP users log on through firewall authentication, the active users per Active Directory LDAP group is counted and displayed in the *Firewall Users* widget and the CLI.

Example

The Active Directory LDAP server, FORTINET-FSSO.com, is configured with two groups that contain two users each: group1 consists of users test1 and test3; group2 consists of users test2 and test4.

To configure AD LDAP user groups in the GUI:

1. Configure the Active Directory LDAP server, FORTINET-FSSO:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Enter the following:

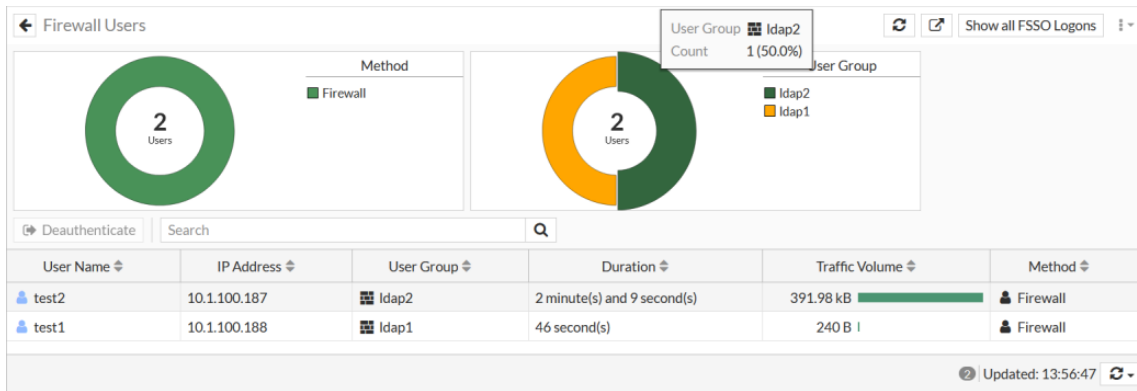

Name	<i>FORTINET-FSSO</i>
Server IP/Name	<i>10.1.100.131</i>
Distinguished Name	<i>dc=FORTINET-FSSO,dc=com</i>
Bind Type	<i>Regular</i>
Username	<i>cn=administrator,cn=users,dc=FORTINET-FSSO,dc=com</i>
Password	Enter the password.

- c. Click OK.
2. Configure the LDAP user groups:
 - a. Go to *User & Authentication > User Groups* and click *Create New*.
 - b. Enter the name, *ldap1*.
 - c. In the *Remote Groups* table, click *Add*. The *Add Group Match* pane opens.
 - d. For *Remote Server*, select *FORTINET-FSSO*.
 - e. In the search box, enter *group1*, and select the result in the table.
 - f. Click OK.

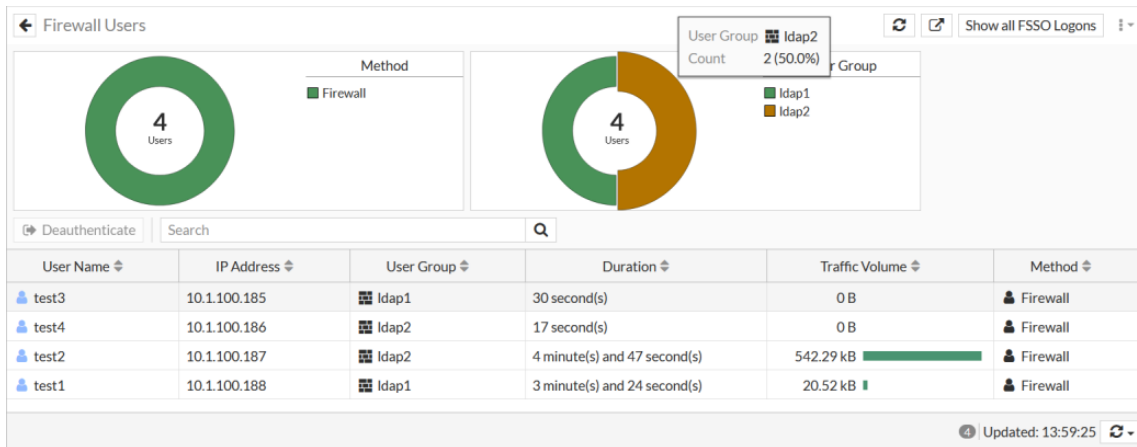

- g. Repeat these steps to configure *ldap2* with the FORTINET-FSSO *group2*.
 - h. Click OK.
3. Configure a firewall policy with both LDAP groups:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Source*, select *ldap1* and *ldap2*.
 - c. Configure the other settings as needed.
 - d. Click OK.

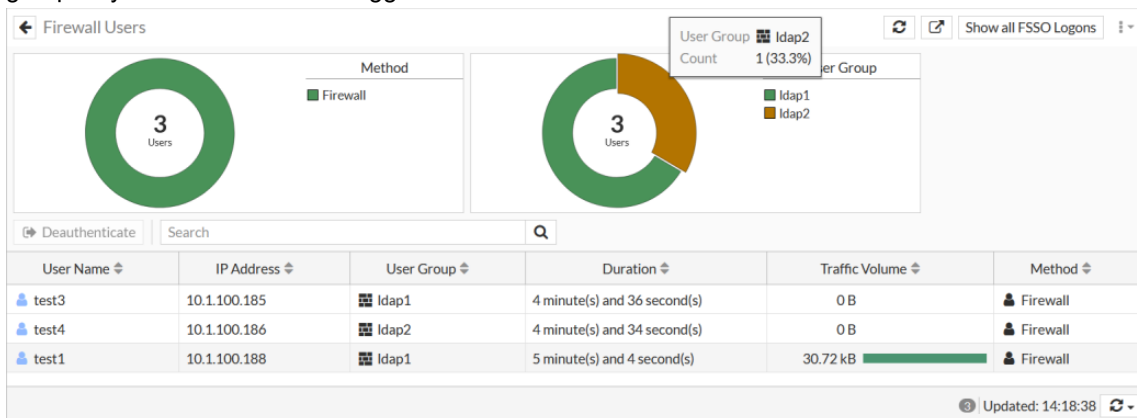

4. Get users test1 and test2 to log in.
5. In FortiOS, go to *Dashboard > Assets & Identities* and click the *Firewall Users* widget to expand to full screen view. Hover over a group in the *User Group* donut chart to view how many users are logged on from that group, and the number of users as a percentage of all logged on users. The chart shows that two users are logged in.

6. Get users test3 and test4 to log in, and refresh the *Firewall Users* widget. Each LDAP group has two users logged in, with a total of four active users.

7. Get user test2 to log out, and refresh the *Firewall Users* widget. There is a total of three active users, and the Idap2 group only has one user that is logged in.

To verify the user group count in the CLI:

```
# diagnose user-device-store user-count list <integer>
# diagnose user-device-store user-count query <FQDN of AD group>
```

Tracking rolling historical records of LDAP user logins

Authenticated LDAP users can be tracked by logging the users' group memberships, logon timestamps, and logout timestamps into local files on a log disk over a rolling four-week period. The historical records can be queried from the CLI. This feature is only enabled on FortiGate models with a log disk.

To view active user logged information:

```
# diagnose user-device-store user-stats query <yyyy-mm-dd> <range_in_days>
```

Example
